Q. Well, the impression made on my mind, Dr. Marks, was that Dr. Humphreys had, as an afterthought, limited it. Now I call your attention to his testimony at page 1947 of this case where he specifically says the reserve fund shall be limited to, "say, one-tenth of the investment as in the case of many British companies." And I also call your attention to page 2469 of the printed testimony before the Gas Commission, where Doctor Humphreys said, "I would like it distinctly understood in my opinion is a reserve should not be called an actual expense of the business but as a reserve and be treated as a reserve and having grown to certain dimensions 2621 should be there stopped." Now, in that view, don't you wish to modify your testimony that Doctor Humphreys at first did not suggest a limitation, of his reserve fund?

A. I do not regard the phrase, "certain dimensions" as a limitation of sufficiently clear character to——

Q. Not even if he says "And having grown to certain dimensions, should be there stopped?" You would not consider that as a statement that it should be limited?

A. Not to any specific amount.

Mr. Burr: It is twenty-five minutes of five. If you have any more questions to ask along this point you had better finish with him now. We propose to start in Monday morning to examine the plants, and Dr. Marks is our expert to examine the plants.

Mr. MATHEWSON: I will ask one or two other questions then which will be very brief.

Q. Referring to your book at page 220, in an article headed, "Opinion Concerning Reorganization of Gas and Electric Works," you compute a price on gas, a supposititious case in which appear these items:

"Depreciation, 5 per cent. of $125,000," which is supposed to be the investment; then, "Profit and Depreciation 15 per cent." That leaves ten per cent. allowance above the 5 per cent. for depreciation, doesn't it?

A. Yes.

Q. And you include in the price for gas, if I understand it correctly, the depreciation, 5 per cent., and the fixed expenses as you call it, the profit and the manufacturing and distributing expense; what do you mean by the fixed expense, Doctor?

A. The fixed expense differs from what is commonly known as the fixed charges. The fixed expense is very carefully gone into on pages 188 and 189.

2622 Q. Well, I won't go into it at present. The price of 2.11 which you figure out here in this supposititious case includes the price of gas per thousand, $1.10——

A. I beg your pardon. The last three items at the bottom are footed up, making $2.11.

Q. Oh yes, the last three items at the bottom, "Profit and Depreciation, 15 per cent., $1.17"——

A. Of $7.81.

Q. No, $1.17?

A. Yes, 15 per cent. of $7.81 is $1.17.

Q. Then "Fixed Expense for one thousand cubic feet, 0.19," and manufacturing and distributing expense per one thousand 0.75, total $2.11?

A. Yes.

Q. And this $7.81 is the investment as per annual thousand cubic feet of sales upon your assumed capitalization?

A. Yes, in a town of 8,000 inhabitants. I think that is what you were referring to earlier on before here.

Q. Now, on page 239 again you say: "With the allowance of 5 per cent. for depreciation, the net profit to be added to the profit of the electric plant would be $4,536.80, or 10 per cent. on the investment?"

A. Yes.

Q. And you subsequently say in your book, do you not, experience has taught you that 5 per cent. for depreciation in an electric plant is insufficient and that it should be 10 per cent.?

A. In many cases.

Q. And so, too, in various other cases, including Marblehead and Attleboro, I see you refer to a price necessary to yield 5 per cent. depreciation and 10 per cent. profit on the investment (page 188); that is the case, is it not?

A. Yes; that is correct.

Mr. Mathewson: That is all. Now I have not cross-examined
Dr. Marks on the cost of gas and on the matter of value of plant and
its various items, which I understood I might not take
2623 & 2624 up until he has completed his evidence on those subjects,
and there may be a few more questions on these
other features that I have not covered, but they will not be extensive.

The Master: It is understood if they do not wish to call him again on those matters that then you may resume your cross-examination in so far as you may desire on the testimony as it already stands.

Mr. Mathewson: And if they do call him again I shall have the right to cover his subsequent testimony. I will ask you just one more question now.

Q. According to Ohm's law electricity leaves not only by the easiest way, but by every passage which presents itself, the only question being the proportion that goes by the various passages?

A. It does.

At 4.45 o'clock p. m. adjourned to October 8, 1906, at eleven o'clock a. m.

Last Exhibits:

Complainant's 256.
State's W.
City's 54.

2625 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Monday, *October* 8, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Garver, Mr. Burr, and Mr. Kirby.

Mr. Burr: We are about to offer in evidence certain ap-
2626 plications by the Consolidated Gas Company for reduction
of assessments of various plots due in 1903, 1904, 1905 and
1906, showing the estimated value placed upon those lots by the company itself. These are the *certiorari* proceedings I spoke to you about over the 'phone some days ago, Mr. Garver, that we desired to avoid the necessity of calling Mr. Gawtry if possible, so if it was

agreeable to you, after your looking at them we might upon consent enter them upon the record.

Mr. **Garver**: We have no objection to your offering these copies instead of producing the originals, but we object to the papers going in evidence on the ground that it clearly appears from the various petitions that the value that was placed on these properties was not the value of those properties to the company as a going concern, but the value for which the property would, according to the statutory provisions, sell for under ordinary circumstances, and also the fact that the values placed upon the different pieces of property were uneqqual. In other words, the basis of valuation stated in these various applications is entirely different from the basis upon which we rely in the present suit.

Mr. **Burr**: We do not think so, and we think they are admissions as against interest upon the question of valuation of this real estate, and are permissible to be placed upon the record.

The **Master**: They are all verified petitions of the gas company on *certiorari* to review the assessments of the real property?

Mr. **Burr**: Yes, sir.

The **Master**: I will admit them, Mr. Garver, and give you an exception.

Mr. **Garver**: Exception.

Mr. **Mathewson**: That will apply to each one of these without raising the question anew?

2627 The **Master**: Yes, you need not repeat the objection.

Mr. **Burr**: I read from the petition and order for writ of *certiorari* from the Supreme Court, New York County, in the matter of the application of the Consolidated Gas Company of New York for a writ of *certiorari* to the Board of Taxes and Assessments of the City of New York. The order for the writ is dated October 3d, 1903. The petition is signed "Consolidated Gas Company of New York, by Lewis B. Gawtry, Vice-President, Petitioner. Shearman & Sterling, Attorneys for Petitioners." Said petition is verified on the Twenty-third of October, 1903, by the said Lewis B. Gawtry.

Attached to the petition are certain exhibits with regard to each of the parcels referred to in the said petition.

Block 715, Lot 51.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. 438 West 18th Street, in Volume 1 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot 51 in Block No. 715.

It finds that the same has been assessed on the assessment roll of 1903 at a valuation of $9,000, whereas the same should not have been valued at more than $6,250, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

2628 The assessment is illegal and erroneous by reason of overvaluation and in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate of the tax rolls of the city.

The assessed valuation for this lot for the year 1902 was $5,000. The valuation for this year is an increase of 80 per cent.

There have been no improvements upon this lot for a number of years.

The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about thirty-three and one-third per cent. higher than for the year 1902. Even if such increased assessment were legal, any increase in the valuation of the said Lot 69, in excess of thirty-three and one-third per cent., is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the city.

It therefore asks that the same may be reduced to the sum of $6,600.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-President.*

2629 STATE OF NEW YORK, *County of New York:*

On this 28th day of March, 1903, before me personally came Lewis B. Gawtry, to me known, who, being by me duly sworn, did depose and say that he resides in New York City; that he is the Vice-President of the Consolidated Gas Company of New York, the corporation described in, and which executed the foregoing instrument; that he knew the seal of the said corporation, that the seal affixed to said instrument was such corporate seal; that it was so affixed by authority conferred by the Board of Directors of the said corporation, and that he signed his name thereto by like authority.

CORNELIUS A. LOUGHLIN,
Notary Public, New York County.

Certiorari proceedings were also instituted by the Consolidated Gas Company to review the assessments of its real estate for the year 1904 and an order in those proceedings was obtained on October 28, 1904.

Attached to the petition which was verified by Mr. R. A. Carter, Secretary of the Company, on October 27, 1904, are statements referring to the parcels mentioned in the petition. In this statement the grounds of objections are as follows:

"The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

2630 It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902. The assessed valuation for this lot for the year 1902 was $5,000. The valuation for this year is an interest of 100 per cent.

In 1903 the said lot was assessed at a valuation of $9,000. The undersigned filed an application requesting that the assessment be reduced to the sum of $6,600, but no reduction was made, and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessment, which proceedings are now pending.

It therefore asks that the assessed value of said premises for 1904 be fixed at $6,600.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*"

Verification March 28, 1904.

An order in this proceeding was obtained on October 30th, 1905. Attached to the petition which was verified by Lewis B. Gawtry, Vice-President of the Consolidated Gas Company, on March 24, 1905, are statements referring to the parcels mentioned in the petition. In this statement the grounds for objections were the same as those expressed in the petition for a writ of *certiorari* for 1904, except that the following statement was added:

2631 In 1904 the said lot was assessed at a valuation of Ten thousand ($10,000) dollars. In 1903 and 1904 applications were filed by the undersigned requesting that the said assessment be reduced to the sum of $6,600, but no reduction was received on either assessment.

Block 715, Lot No. 59.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. 454 West Eighteenth Street, in Volume 1, of Section 3 of the Borough of Manhattan, of the City of New York, designated on the Tax Map as Lot No. 59 in Block 715.

He finds that the same has been assessed on the Assessment Roll of 1902 at a valuation of $165,000, whereas the same should not have been, in his judgment, valued at more than $100,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

Lot 8, Block 716, on West 18th Street, an- immediately opposite, is assessed for only $3.91 per square foot, while said lot of the undersigned is assessed for $8.97 per square foot.

Lot 7, Block 716, is assessed at the rate of $5.65 per square foot.

2632 Lot 12, Block 715, is assessed at the rate of $3 per square foot. Other lots in Block 716 are also assessed at a much lower figure than said lot of the undersigned.

Lots 7, 8, 9, 10, 11, 12, 13, 14, Block 715, and facing on West 17th Street, are assessed from $5.47 per square foot to $7 per square foot.

The undersigned claims that the aforesaid lots with the improvements thereon have a market value proportionate to that of the said lot of the undersigned, and that there is no reason why his said lot should be assessed at any higher rate than any of the said lots mentioned or other lots in the immediate vicinity.

The undersigned has objected to this assessment at the sum of $165,000 in former years as it has always believed that this assessment was in excess of the market value of the property.

It therefore asks that the same may be reduced to the sum of $100,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-President.*

Verification March 28th, 1903.

Block 716, Lot 14.

The application for the year 1905 recites as follows:

To the Commissioners of Taxes and Assessments:

Location of property, between 9th and 10th Avenues and 18th and 19th Streets.

Volume 1, Section or Ward 3, Lot 14, Block 715.

2633 Assessed valuation 1905, $36,000, with improvements; $32,000, unimproved.

The undersigned represents that it is the owner of the above described property and claims to be aggrieved by the aforesaid valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the city.

The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The assessed total valuation for this lot for the year 1902 was $25,000. The valuation for this year is an increase of 44 per cent.

There is a stable on this lot which has but little market value.

In 1903 and 1904 there was no assessed valuation of improvements, while this year, with the same cond-tions existing, the improvements were assessed at $4,000.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $25,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK, 4 *Irving Place.*

Verification March 24th, 1905.

2634 Block 870, Lot 54.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. 124 East 15th Street, in Volume 3 of Section 3, of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 54 in Block No. 870.

It finds that the same has been assessed on the assessment roll of 1903 at a valuation of $11,000, whereas the same should not have been valued at more than $7,500, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation, and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

There is an old home on this lot which has been damaged by fire. The same is now practically worthless, except for storage purposes.

This lot was assessed at a valuation of $6,000 for the year 1902. The valuation for this year is an increase of 85 per cent.

The value of said lot and of other real estate in the same ward and section or in the same locality with it has not increased materially since the second Monday in January, 1902.

2635 The undersigned is informed and believes that the total assessed valuation in the City of New York for the year 1903 is about thirty-three and one-third per cent. higher than for the year 1902. Even if such increased assessment were legal, any increase in the valuation of said Lot No. 54 in excess of thirty-three and one-third per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the city.

It therefore asks that same may be reduced to the sum of $7,500.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

Block 870, Lot No. 56.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. 126 East 15th Street, in Volume 3 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 56 in Block No. 870.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $50,000, whereas the same should not have been valued at more than $37,500, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over valuation and is in excess of what the property would sell for under ordinary circumstances.

2636 The aforesaid assessment also is illegal and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the city.

The assessed valuation of this lot for the year 1902 was $30,000. The assessed valuation for this year is an increase at the rate of 67%.

There have been no improvements on the said lot of the undersigned and the value of said lot and of other real estate in the same locality has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is almost 33⅓% higher than for the year 1902.

Even if such increased assessment were legal, any increase in the valuation of said lot No. 56 in excess of 33⅓% is unfair, illegal and erroneous, and not in proportion to the value placed upon other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

It therefore asks that the same may be reduced to the sum of $37,500.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
LEWIS B. GAWTRY, *Vice-President.*

Verification March 28th, 1903.

2637 Block 952, Lot No. 29.

The application for 1904 recites as follows:

BOROUGH OF MANHATTAN.

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate at the corner of Avenue A and 20th Street, in Volume 4 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 29 in Block No. 952.

It finds that the same has been assessed on the Assessment Roll of 1904 at the valuation of $10,000, whereas the same should not have been valued at more than $7,000, to be in proportion to the assessed value of adjacent property and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation, and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

The value of this lot has not increased since the second Monday in January, 1903. This lot was assessed for $7,000 for the year 1903, which sum represented the fair market value of the property. There is no reason for the increase in the assessment.

This lot is assessed at the rate of $6.96 per square foot. The lots immediately north of it on Avenue A are assessed, unimproved, at only $4.08 per square foot.

2638 It therefore asks that the assessed value of said premises for the year 1904 be fixed at $7,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28, 1904.

Block 952, Lot 29.

The application for the year 1905 is substantially the same as the application for the year 1903, with the exception that in place of paragraphs 6 and 7 in the application for 1903 the following appears:

In 1904 this lot was assessed at a valuation of $10,000 and the undersigned filed an application to reduce the said assessment to $7,000, but no reduction was made and the undersigned instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessment, which proceedings are now pending.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $7,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK.

Address, 4 Irving Place, New York City.
Verification March 24, 1905.

Block 952, Lots 33 and 34.

The application for the year 1905 recites as follows:

To the Commissioners of Taxes and Assessments:

Location of property, Nos. 333 and 335 Avenue A.
2639 Volume 4, Section or Ward 3, Lots 33 and 34, Block 952.
Assessed valuation, 1905, Lot 33, $8,000, with improvements.
Assessed valuation, 1905, Lot 33, $6,500, unimproved.
Assessed valuation, 1905, Lot 34, $8,000, with improvements.
Assessed valuation, 1905, Lot 34, $7,000, unimproved.

The undersigned represents that it is the owner of the above described property and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessments are illegal and erroneous by reason of overvaluation and are in excess of what the property would sell for under ordinary circumstances.

They are also illegal and erroneous by reason of inequality, in that they have been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

The assessed valuation of these two lots for the year 1902 was $5,000 each. The assessed valuation for this year is accordingly an increase of 60 per cent.

There are some old tenement houses on this property upon which no improvements have been made for many years.

In 1903 the said lots were assessed at a valuation of $8,000 each, and in 1904 they were assessed, for the same amount. In 2640 both years the undersigned filed applications, requesting that the assessments be reduced, but no reduction was made, and the undersigned instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessments of 1903 and 1904, which proceedings are now pending.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $6,250.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK.

Address, 4 Irving Place, New York City.
Verification March 29, 1905.
952—33-34.

Substantially the same application was made for the years 1903 and 1904.

Block 952, Lot No. 35.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. 341 Avenue A, in Volume 4 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 35 in Block No. 952.

It finds that the same has been assessed on the assessment roll of 1903 at a valuation of $45,000, whereas the same should not have been valued at more than $30,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

2641 The assessment is illegal and erroneous by reason of overvaluation and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate on the tax rolls of the city.

The assessed valuation of the said lot for the year 1902 was $30,000. The assessed valuation for this year is an increase of 50 per cent.

The value of said lot and of other real estate in the same ward and section or in the same locality has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about thirty-three and one-third per cent. higher than for the year 1902. Even if such increased assessment is legal, any increase in the valuation of the said Lot No. 35 in excess of thirty-three and one-third per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate on the tax rolls of the city.

It therefore asks that the same may be reduced to the sum of $30,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-President.*

Verification March 28th, 1903.

2642 Block 952, Lot 35.

The application for the year 1904 recites the following grounds of objection:

The assessment is illegal and erroneous by reason of over valuation, and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportion valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

The improvements on this property, according to the above figures, are assessed at $20,000. They consist of a valve house with a considerable amount of machinery in it, which should not be assessed as real property. The valve house is not worth more than $10,000, at which sum the undersigned values it and insures it for that amount.

In 1903 the said lot was assessed at a valuation of $45,000. The undersigned filed an application requesting that the assessment be reduced to the sum of $30,000, but no reduction was made, and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessment, which proceedings are now pending.

It therefore asks that the assessed value of said premises for the year 1904 be fixed at $30,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1904.

2643 952, Lot 35.

The application for 1905 differs in the following respects:

The improvements on this property, according to the above figures, are assessed at $20,000. They consist of a valve house with a considerable amount of machinery on it, which should not be assessed as real property. The valve house is not worth more than $8,000.

Since the second Monday of January, 1905, we have had the property appraised by skillful real estate experts, who value the land at $18,988, and the buildings at $8,000.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $26,988.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK.

Address, 4 Irving Place, New York City.
Verification March 24th, 1905.

The application for 1906 recites the following:

Location of property, No. 341 Avenue A.

Volume 4, Section or Ward 3, Lot 35, Block 952.

Assessed valuation, 1906, $45,000, with improvements; $25,000 unimproved.

The undersigned represents that it is the owner of the above described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same revised and corrected.

The ground of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation, and is in excess of what the property would sell for under ordinary circumstances.

2644 The improvements on this property, according to the above figures, are assessed at $20,000. They consist of a valve house with a considerable amount of machinery in it, which should not be assessed as real property. The valve house is not worth more than $8,000, and adds no more than that sum to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $33,000.

Name, CONSOLIDATED GAS COMPANY OF
NEW YORK,
LEWIS B. GAWTRY, *Vice-Pres.*

Address, 4 Irving Place, New York City.
Verification 29 day of March, 1906.

Block 953, Lot No. 1.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate lying between First Avenue and Avenue A and 21st and 22nd Street, in Volume 4 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 1 in Block No. 953.

It finds that the same has been assessed on the assessment roll of 1903 at a valuation of $800,000, whereas the same should not have been valued at more than $700,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal, unfair and erroneous by reason of overvaluation and is in excess of what the property would sell for under ordinary circumstances.

2645 There are six gas holders on this property, which are very old, together with a meter, repair shop and two or three valve houses. The property is depreciating in value owing to the wear and tear on the machinery and appliances.

The assessed valuation for 1902 was $610,000. There has been an increase of 31 per cent. without any reason, as there have been no improvements on the property nor any increase in the value of property in the same locality since the second Monday in January, 1902.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

Block No. 954, which is exactly the same size as said Block 953 immediately to the north of it, is assessed at $721,500.

Block 927, which is considerably larger than said Block No. 953, is assessed at a valuation of $783,000. The improvements on both these blocks have a much higher market value than those on the said block of the undersigned.

It therefore asks that the same may be reduced to the sum of $700,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-President.*

Verification March 28th, 1903.

The application for 1904 recites as follows:

Location of property, between 21st and 22nd Streets and Avenue A and First Avenue.

Volume 4, Section 3, Lot 1, Block 953.

Assessed valuation, 1904, $800,000, with improvements.

2646 Assessed valuation, 1904, $500,000, unimproved.

The undersigned represents that it is the owner of the above-described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal, unfair and erroneous by reason of overvaluation and is in excess of what the property would sell for under ordinary circumstances.

There are six gas holders on this property, which are very old, together with a meter repair shop and two or three valve houses.

The improvements are assessed at $300,000, but they are not worth more than $266,000, at which sum the undersigned values them for the purposes of insurance.

The assessed valuation for 1902 was $610,000. There has been an increase of 31 per cent., although there have been no improvements on the property, nor any increase in the value of the same, nor of property in the same locality with it, since the second Monday in January, 1902.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the city.

The valuation for the land alone is $500,000. The block between 19th and 20th Streets and First Avenue and Avenue A is assessed for $373,500, unimproved. The block above the one in question, that is, between 22nd and 23d Streets, is assessed for $470,000, unimproved, and the block above that at $448,000, unimproved.

2647 There is great inequality here. Block 853 is certainly no more valuable than those fronting on 23d Street.

In 1903 the said lot of the undersigned was assessed at a valuation of $800,000, with improvements. The undersigned filed an application requesting that the assessment be reduced to the sum of $700,000, but no reduction was made, and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessment, which proceedings are now pending.

It therefore asks that the assessed value of said premises for the year 1904 be fixed at $700,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28, 1904.

In 1905 an identical application was presented.

Verification March 24, 1905.

In 1906 the application recites as follows:

Location of property, No. ––, 21st & 22nd Sts. & Ave. A & 1st Ave.

Volume 4, Section or Ward 3, Lot 1, Block 953.

Assessed valuation, 1906, $785,000, with improvements; $500,000 unimproved.

The undersigned represents that it is the owner of the above described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal, unfair and erroneous by reason of overvaluation, and is in excess of what the property would sell for under ordinary circumstances.

There are six gas holders on this property, which are very old, together with a meter repair shop and two or three valve 2648 houses, all of which add nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $500,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
Name, LEWIS B. GAWTRY, (Signed) *Vice-Pres.*

Address, 4 Irving Place, New York City.
Verification 29 day of March, 1906.

Block 972, Lot No. 45.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. 536 East 15th Street, in Volume 4 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 45 in Block No. 972.

It finds that the same have been assessed on the Assessment Roll of 1903 at a valuation of $19,000, whereas the same should not have been valued at more than $13,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

There is nothing on this property but a little pump house, not in use, and an old well. The lot has a frontage on the street of only 13 feet, and although it widens in the rear, such increased width adds but little to the value of the property.

The assessed valuation of this property for the year 1902
2649 was $13,000, which represented more than the full market
value of the property. There has been an increased valuation at the rate of 46%, without any reason.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higer proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

It therefore asks that the same may be reduced to the sum of $13,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-President.*

Verification March 28th, 1903.

The application for 1904 is the same as the application for 1903, except that it differs in the following respects:

Location of property, No. 536 East 15th Street.

Volume 4, Section 3, Lot 45, Block 972.

Assessed valuation, 1904, $21,000, with improvements.

Assessed valuation, 1904, $20,000, unimproved.

There is nothing on this property but a little pump house, not in use, and an old well. The tax map shows that this lot has a frontage on the street of only 3 feet 6 inches, and, although it widens in the rear, such increased width adds but little to the value of the property.

Lot 51 immediately adjoining said Lot 45 has a frontage of 142 feet and is assessed for only $20,000, unimproved. Said Lot 45, notwithstanding its extremely small frontage, is assessed unimproved for nearly as much per square foot as other lots in said Block 972, and on a valuation per front foot is assessed entirely out of proportion to other lots in the immediate vicinity.

2650 It therefore asks that the assessed value of said premise for the year 1904 be fixed at $13,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 29, 1904.

The application for 1905 is substantially similar to the application for 1904.

Verification March 24, 1905.

The application for 1906 recites as follows:

Location of property, No. 536 East 15th Street.
Volume 4, Section or Ward 3, Lot 45, Block 972.
Assessed valuation, 1906, $21,000, with improvements.
Assessed valuation, 1906, $20,000, unimproved.

The undersigned represents that it is the owner of the above described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation, and is in excess of what the property would sell for under ordinary circumstances.

There is nothing on this property but a little pump house, not in use, and an old well. The Tax Map shows that this lot has a frontage on the street of only 3 feet 6 inches, and, although it widens in the rear, such increased width adds but little to the value of the property.

The assessed valuation of this property for the year 1902 was $13,000, which represented more than the full market value of the same. In 1903 the said lot was assessed at a valuation of $19,000, and in 1904 and 1905 at a valuation of $21,000. In 1903,
2651 1904 and 1905 the undersigned filed applications requesting that the assessments be reduced to $13,000, but no reduction was made, and in all three years the undersigned instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessments for 1903, 1904 and 1905, which proceedings are now pending. The value of the said property has not increased since 1902 and there is no justification for its increased assessment.

The assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the city.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $13,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
Name, LEWIS B. GAWTRY (Signed), *Vice-Pres.*

Address, 4 Irving Place, New York City.
Verification March 29, 1906.

Block 978, Lot No. 1.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate located on the corner of 20th Street and Avenue A, in Volume 4 of Section 3 of the Borough of Manhattan, of the City of New York, designated on the Tax Map as Lot No. 1 in Block No. 978.

It finds that the same has been assessed on the Assessment
2652 Roll of 1903 at a valuation of $15,000, whereas the same should not have been valued at more than $10,000, to be in

proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and unfair and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the city.

The value of this lot and other real estate in the same ward and section or in the same locality with it has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about 33⅓% higher than for the year 1902. Even if such increased assessment is legal, any increase in the valuation of said Lot 1 in excess of 33⅓% is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the city.

He therefore asks that the same may be reduced to the sum of $10,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

Block 978, Lot No. 6.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

2653 The undersigned represents that it is the owner of real estate located on Avenue B, between 20th and 21st Streets, in Volume 4 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 6 in Block No. 978.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $500,000, whereas the same should not have been valued at more than $400,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation, and is in excess of what the property would sell for under ordinary circumstances.

The assessed valuation of this lot for the year 1902 was $325,000. The valuation for this year is an increase of 54%.

There are gas works, a coal storage house and a purifying apparatus on this lot. The same can only be used for the purpose of manufacturing gas. There have been no improvements on this property during the last year.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The value of this Lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York, for the year 1903, is about 33⅓% higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of said Lot 6, in excess of 33⅓% is unfair, illegal and erroneous and
2654 not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $400,000.

THE CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification 28th of March, 1903.

The application for the year 1904 was substantially similar except that it stated the assessed valuation for 1904 to be $500,000 with improvements and $320,000 unimproved.

Paragraph 5 in the Petition for 1903 appears in the Petition of 1904 as follows:

There are gas works, a coal storage house and a purifying apparatus on this lot, all of which can only be used for the purpose of manufacturing gas. These improvements according to the above figures are assessed for $180,000. They are not worth more than $158,000, at which sum the undersigned values them for the purposes of insurance.

Verification March 28, 1904.

The Application for the year 1905 was substantially similar to that for 1904, except that the clause quoted in full for 1904 reads as follows in the petition for 1905:

There are gas works, a coal storage house and a purifying apparatus on this lot, all of which can only be used for the purpose of manufacturing gas. These improvements according to the above figures are assessed for $180,000, but they are an inadequate improvement for the land, and add nothing to its value.

2655 Since the second Monday of January, 1905, we have had the property appraised by skillful real estate experts who value the land at $299,512, and state that the buildings add nothing to its market value.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $300,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK,

Address, 4 Irving Place, New York City.
Verification, March 24th, 1905.

The application for 1906 recites as follows:

Location of property, Avenue B, between 20th and 21st Streets.

Volume 4, Section or Ward 3, Lot 6, Block 978.

Assessed valuation, 1906, $500,000, with improvements.

$335,000, unimproved.

The undersigned represents that it is the owner of the above-described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

There are gas works, a coal storage house and a purifying apparatus on this lot, all of which can only be used for the purpose of manufacturing gas. These improvements are an inadequate improvement for the land, and add nothing to the amount for which it would sell under ordinary circumstances.

2656 It therefore asks that the assessed value of said premises for the year 1906 be fixed at $335,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sgd.) LEWIS B. GAWTRY, *V. P.*

Address, 4 Irving Place, New York City.
Verification, March 29, 1906.

Block 979, Lot No. 1.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate comprising the block bounded by 21st and 22nd Streets and Avenue A and the marginal Street, in Volume 4 of Section 3 of the Borough of Manhattan of The City of New York, designated on the Tax Map as Lot No. 1 in Block No. 979.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $540,000, whereas, the same should not have been valued at more than $456,250 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The said assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character, in the same ward and section, and other real estate on the tax rolls of the City.

The assessed valuation of this property for the years 1900, 1901

2657 and 1902, was $365,000. The increased valuation at a rate of 48% is excessive and without reason, as there has been no change in the character of the property nor of the neighborhood since last year.

This lot is occupied by works of the Gas Company. There have been no improvements of such a nature as to increase the value of the property, which can only be used for the purposes of a gas works. Owing to wear and tear of the machinery and appliances, the property has depreciated in value.

Certain inequalities in the assessment of surrounding property to be noted are as follows:

Blocks 980 and 977 are both assessed at a less sum in proportion than said lot of the undersigned. The assessed value of the said lot is at the rate of $4.79 per square foot. The assessed value of Block 977 is at the rate of $3.63 per square foot; and Block 980 is also assessed at a lower rate per square foot than said lot of the undersigned.

The value of this lot and of other real estate in the same ward and section or in the same locality has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuations of real estate in the City of New York, for the year 1903, is about 33⅓% higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of said Lot, in excess of 33⅓% is illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

He therefore asks that the same may be reduced to the sum of $456,250.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-President.*

Verification March 28th, 1903.

2658 For the year 1904 the application, paragraph 1, same as paragraph 1 for 1903, with the following difference: Assessed valuation, $540,000, with improvements; $350,000, unimproved.

Paragraphs 2, 3, 4, 5 are substantially the same as paragraphs 2, 3, 4, 5 for 1903.

The following appears in the place of paragraphs 6, 7, 8, 9, 10 and 11 in the application for 1903:

The improvements on this lot comprise a plant for the manufacture of gas.

The improvements are assessed for $190,000, but they are not worth more than $135,550, at which sum the undersigned values them and insures them.

In 1903, the said lot of the undersigned was assessed at a valuation of $540,000, with improvements. The undersigned filed an application requesting that the assessment be reduced to the sum of $456,000, but no reduction was made, and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessment, which proceedings are now pending.

It therefore asks that the assessed value of said premises for the year 1904, be fixed at $456,250.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sgd.) LEWIS B. GAWTRY, *Vice-President.*

Verification March 28, 1904.

The application for the year 1905 recites as follows:

Paragraph 1 the same as paragraph 1 for 1903, with this exception:

Assessed valuation for 1905 $542,000, with improvements; $351,500 unimproved.

Paragraphs 2, 3 and 4 are the same as paragraphs 2, 3 and 4 for 1903, and in the place of paragraphs 6, 7, 8, 9, 10 and 11 for 1903 the following appears:

2659 The improvements on this lot comprise a plant for the manufacture of gas.

The improvements consist of a brick building, containing a gas plant, a large part of which is machinery. The said building is an inadequate improvement for the land and adds nothing to its market value.

In 1903 and 1904, the said lot of the undersigned was assessed in two parcels, one at $540,000 and the other at $1,500, making $541,500, with improvements. In both years the undersigned filed application requesting that the assessment of the larger lot be reduced to $456,250, but no reduction was made and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State, to reduce the said assessments of 1903 and 1904, which proceedings are now pending. The lot that was assessed at $1,500 in 1903 and 1904 has been included in the same parcel with the lot that was assessed for $540,000, making the net increase on the portion of the plot which was assessed in 1903 and 1904 at $540,000 the sum of $500, assuming that the lot that was separately assessed in those years at $1,500 is included in the larger assessment for 1905 at the same amount.

The assessed valuation of the larger lot for the years 1900, 1901 and 1902 was $365,000. The increased valuation at the rate of nearly 48 per cent. is excessive, as there has been no increase in the valuation of this lot since the second Monday in January, 1902.

Since the second Monday of January, 1905, we have had the property appraised by skillful real estate experts who value the land at $320,000 and state that the buildings add nothing to its market value.

2660 It therefore asks that the assessed value of said premises for the year 1905 be fixed at $350,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK.

Address, 4 Irving Place, New York City.
Verification March 24th, 1905.

The application for 1906 recites as follows:

Location of property, Block bounded by 21st and 22d Sts. and Ave. A. and the marginal St.

Volume 4, Section or Ward 3, Lot 1, Block 979.

Assessed valuation 1906, $542,000, with improvements, $351,500 unimproved.

The undersigned represents that it is the owner of the above-described property and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same revived and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The improvements on this lot comprise a plant for the manufacture of gas.

The improvements consist of a brick building, containing a gas plant, a large part of which is machinery, which is personal property. The said building is an inadequate improvement for the land and adds nothing to the amount for which it would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $351,500.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK,
(Signed) LEWIS B. GAWTRY, *V. P.*

Address, 4 Irving Place, New York City.
Verification 29th day of March, 1906.

2661 Block 982, Lot No. 13.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate located on Avenue C. between 14th and 15th Streets in Volume 4 of Section 3 of the Borough of Manhattan of The City of New York, designated on the Tax Map as Lot 13 in Block 982.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $475,000. Whereas the same should not have been valued at more than $375,000 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The assessed valuation of this property for the year 1902 was $375,000. There has been an increase of 27 per cent. without any apparent reason.

There are six very old gas holders on this lot, and a meter and purifying house. The property can only be used for the purpose of manufacturing gas.

There have been no improvements on the property since the second Monday in January, 1902, and the value of the same and the value of the property in the said ward and section or in the same locality has not increased, on the contrary this property has decreased in value.

The aforesaid assessment is illegal and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the City.

2662 It therefore asks that the same may be reduced to $375,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for 1904 is substantially the same as the application for 1903 with the exception that in paragraph 1 the assessed valuation for 1904 reads: $475,000, with improvements; $250,000, unimproved. And in place of paragraph 6 in the application for 1903 appears the following:

"There are six very old gas holders on this lot, and a meter and purifying house, which can only be used for the purpose of manufacturing gas.

"These improvements are assessed for $225,000, but they are not worth more than $156,350, at which sum the undersigned values and insures them."

The Petition concludes:

"It therefore asks that the assessed value of said premises, with improvements, for 1904, be fixed at $375,000, which sum represents their fair market value.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sgd.) LEWIS B. GAWTRY, *Vice-Pres.*"

Verification March 28, 1904.

The application for 1905 is the same as the application for 1903, with the exception that in paragraph 1 the assessed valuation for 1905 reads: $475,000, with improvements, $275,000 unimproved, and in place of paragraphs 6, 7 and 8, appears the following:

2663 "Since the second Monday of January, 1905, we have had the property appraised by skillful real estate experts who valued the land at $182,074 and stated that the buildings, except the gas holders, add nothing to its market value. These gas holders are not under any circumstances worth more than $126,000. The meter and purifying house should not be valued at more than $31,000. The assessment of the property, therefore, at any sum above $339,074 is unfair, illegal and erroneous.

It therefore asks that the assessed valuation of the said premises for 1905 be fixed at $339,074.

CONSOLIDATED GAS COMPANY OF
NEW YORK.

4 Irving Place, N. Y. C."
Verification, March 29, 1905.

Block 985, Lot No. 7.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate on East Eighteenth Street, in Volume 4 of Section 3 of the Borough of Manhattan of The City of New York, designated on the Tax Map as Lot 7 in Block 985.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $180,000, whereas the same should not have been valued at more than $156,250 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

2664 It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate character than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The assessed valuation of this lot for the year 1902 was $125,000. The valuation for this year is an increase of 44 per cent.

The value of this lot and of the other real estate in the same ward and section or in the same locality has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuations of real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of the said Lot 7 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $156,250.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for 1904 is the same as the application for the year 1903, with the exception that in paragraph 1 the assessed valuation reads: $200,000, with improvements, $140,000 unimproved.

In other respects the application is substantially similar, except that paragraphs 5, 6 and 7 in 1903 are omitted and the following appears in place thereof:

"There are two very old gas holders and a small valve house on this lot. These improvements are assessed for $60,000, but 2665 they are not worth more than $31,600, at which sum the undersigned values and insures them.

In 1903, the undersigned filed an application requesting that the assessment be reduced to $156,250, which sum represents the fair market value of the property, but no reduction was made, and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessment, which proceedings are now pending.

It therefore asks that the assessed value of said premises for the year 1904 be fixed at $156,250.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
(Sgd.) LEWIS B. GAWTRY, *Vice-Pres.*"

Verification March 28, 1904.

The application for the year 1905 is substantially similar to that for 1904.

Verification March 24, 1905.

The application for 1906 recites as follows:

Location of Property, East 18th Street between Avenues B and C.

Volume 4, Section or Ward 3, Lot 7, Block 985.

Assessed valuation, 1906, $200,000, with improvements.

$155,000, unimproved.

The undersigned represents that it is the owner of the above-described property and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

There are two very old gas holders and a small valve house 2666 on this lot. These improvements add nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $155,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
Name, LEWIS B. GAWTRY, *Vice-Pres.*

Address, 4 Irving Place, New York City.
Verification 29 day of March, 1906.

Block 987, Lot 37.

The application for 1904 recites as follows:

BOROUGH OF MANHATTAN.

To the Commissioners of Taxes and Assessment-:

The undersigned represents that it is the owner of real estate on Avenue B, between East 20th and East 21st Streets in Volume 4, of Section 3, of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot Number 37, in Block 987.

It finds that the same has been assessed on the Assessment Roll of 1904 at a valuation of $60,000, whereas the same should not have been valued at more than $50,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward 2667 and section, and other real estate on the tax rolls of the City.

The value of this lot has not increased since the second Monday in January, 1903, on which date it was assessed for $50,000. This lot is vacant and unimproved, and there is no reason for the increased valuation.

A lot, between East 19th and East 20th Streets and East of Avenue B, corresponding in location to the said lot of the undersigned, and of the same size, is assessed for only $50,000.

It therefore asks that the assessed value of said premises for the year 1904 be fixed at $50,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28, 1904.

The application for 1905 is substantially the same as the application for 1904, with the exception that it shows assessed valuation of $55,000.

In other respects the application is substantially similar, except that the following is introduced in place of paragraphs 6 and 7:

The total size of lots No. 1 and No. 33 between East 19th and East 20th Streets and east of Avenue B is just equal to the lot of the undersigned, and these two lots correspond in location to the said lot of the undersigned. The two lots are assessed at a total valuation of $50,000, unimproved.

It therefore asks that the assessed value of said premises for the year 1905, be fixed at $50,000.

Name, CONSOLIDATED GAS COMPANY OF
NEW YORK.

Address, 4 Irving Place, New York City.
Verification, March 24, 1905.

2668 Block 988, Lot No. 1.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate comprising the block bounded by 14th and 15th Streets and Avenues C and D, in Volume 4 of Section 3 of the Borough of Manhattan of The City of New York, designated on the Tax Map as Lot No. 1 in Block No. 988.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $550,000, whereas the same should not have been valued at more than $400,000 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, on the tax rolls of the City.

Lot 1 in Block 989 to the north of Block 988 is also owned by the undersigned and is assessed at $450,000 which is an over-valuation. Lot 1 in Block 988 is not worth more than said Block 989 and is assessed higher.

The total assessed valuation of Block 383 to the south of Block 988 is $508,000. This block is cut up into lots and is partly improved and should be worth more than said block of the undersigned, though its assessment is not so high.

2669 It therefore asks that the same may be reduced to the amount stated.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

For the year 1904 the application is substantially the same, with the exception that the assessed valuation for 1904 reads $550,000, with improvements, $350,000, unimproved, and the following are inserted in place of paragraphs 5, 6 and 7 in the application of 1903:

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

In 1903, the said lot was assessed for $550,000, with improvements. The undersigned filed an application requesting that the assessment be reduced to the sum of $400,000, which sum represents the fair market value of the property, but no reduction was made, and the undersigned has instituted *certiorari* proceedings to reduce the said assessment, which proceedings are now pending.

It therefore asks that the assessed value of said premises for the year 1904 be fixed at $400,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK.
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28, 1904.

The application for 1905 is substantially the same as the application for 1904, with the addition of the following:

2670 "Since the second Monday of January, 1905, we have had the property appraised by skillful real estate experts, who value the land at $293,188.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $400,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK.

4 Irving Place, New York City."

Verification March 24, 1905.

Block 991, Lot 1.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate situate between 14th and 15th Streets and Avenue D and Tompkins Street, in Volume 4 of Section 3 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 1 in Block No. 991.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $180,000, whereas the same should not have been valued at more than $156,250 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The assessed valuation of this property for the year 1902 was $125,000. The assessed valuation for this year is an increase of 44 per cent.

There has been no change whatever in the character of the property or that of the neighborhood. The land is used for the storing of coal.

2671 The aforesaid assessment is also illeged and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuations of real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment is legal any increase in the valuation of the said Lot No. 1 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $156,250.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for 1904 is substantially the same as the application for 1903, except that paragraphs 5, 7 and 8 in the application for 1903 are omitted in 1904.

2672 Block 991, Lot No. 26.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate lying between 14th and 15th Streets and Avenue D and Tompkins Street, in Volume 4 of Section 3 of the Borough of Manhattan of the City of New York, designat*ion* on Tax Map as Lot No. 26 in Block No. 991.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $125,000, whereas the same should not have been, in *his* judgment, valued at more than $106,250 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The assessed valuation of said lot for the year 1902 was $85,000. The assessed valuation for this year is an increase of 47 per cent. There has been no change whatever in the character of the property nor that of the neighborhood.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The value of said lot and of real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year
2673 1903 is about 33⅓ per cent. higher than for the year 1902.

Even if such increased assessment is legal any increase in the valuation of the said Lot No. 26 in excess of 33⅓ per cent. is unfair, illegal, and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $106,250.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for 1904 is substantially the same as the one for 1903, except that paragraphs 6 and 7 in the application for 1903 are omitted from the application for 1904.

Block 1070, Lot No. 5.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate known as No. 551 West 41st Street, in Volume 2 of Section 4 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 5 in Block No. 1070.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $65,000, whereas the same should not have been valued at more than $62,500 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over
2674 valuation and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The assessed valuation of this lot for the year 1902 was $50,000. The assessed valuation for this year is an increase of 30 per cent.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902.

The value of said lot and of other real estate in the same locality with the said lot of the undersigned has not increased since the second Monday of January, 1902. Even if such increased assessment were legal, any increase in the valuation of said Lot No. 5 in excess of 33⅓ per cent. is unfair, illegal and erroneous, and not in proportion to the valuation placed upon other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $62,500.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for 1904 is substantially the same as the one for the year 1903, except that the assessed valuation is stated to be $75,000, with improvements, $58,000, unimproved, and the following is inserted in place of paragraph 7 for the year 1903:

2675 "The value of this lot has not increased since the second Monday in January, 1902. The assessed valuation of this lot for that year was $50,000. The assessed valuation for this year is an increase of 50 per cent.

There is a stable on the rear of this lot and a storage house occupies a portion of it, but a large part of the lot is vacant. These improvements are assessed for $17,000, but they are not worth more than $10,000, at which the undersigned values and insures them."

Verification March 28, 1904.

The application for the year 1905 is substantially the same as the application for the year 1904, with the exception that the assessed valuation for 1905 is stated to be $70,000, with improvements, and $58,000 unimproved.

Verification March 29, 1905.

Block 1071, Lots Nos. 10, 11, 12 and 13.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that is is the owner of real estate known as No. —, 42d Street, in Volume 2 of Section 4 of the Borough of Manhattan of The City of New York, designated on the Tax Map as Lots Nos. 10, 11, 12 and 13 in Block No. 1071.

It finds that the same has been assessed on the Assessment Roll of 1903 at a total valuation of $38,000, whereas the same should not have been valued at more than $30,000 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

2676 It is also illegal and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

These lots are all vacant and unimproved in any way. The assessed valuation for 1902 was $24,000. The assessment for this year is an increase of 58 per cent.

The value of these lots and of other real estate in the same ward and section or in the same locality with them has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York, for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessement were legal any increase in the valuation of said Lots Nos. 10, 11, 12 and 13 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $30,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for 1906 recites as follows:
Location of Property.
Volume 2, Section or Ward 4, Lot 1, Block 1089.
Assessed Valuation, 1906, $800,000, with improvements.
$525,000, unimproved.

2677 The undersigned represents that it is the owner of the above-described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

There are four holders and a gas plant on this plot, which can only be used for the purpose of manufacturing and storing gas and which add nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $525,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
Name, LEWIS B. GAWTRY, *P.*

Address, 4 Irving Place, New York City.

Verification March 29, 1906.

Block 1090, Lot No. 23.

The application for 1904 recites as follows:

BOROUGH OF MANHATTAN.

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate on the north side of West 42d Street, between Eleventh and Twelfth Avenues, in Volume 2 of Section 4 of the Borough of Manhattan of The City of New York, designated on the Tax Map as Lot No. 23 in Block No. 1090.

It finds that the same has been assessed on the Assessment Roll of 1904 at a valuation of $55,000, with improvements and 2678 $50,000 unimproved, whereas the same should not have been valued at more than $36,000 with improvements, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the City.

In 1903 the said lot was assessed for $36,000 with improvements, which sum represented the fair market value of the property. There is no reason for the increased assessment this year.

The improvements are assessed at a valuation of $5,000. The lot is used for the storage of coke and the only improvement on it is a small one-story brick, office building. This building is not worth more than $1,000, at which sum the undersigned values and insures it.

It therefore asks that the assessed value of said premises for the year 1904 be fixed at $36,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
(Sd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28, 1904.

The Application for the year 1905 is substantially the same as for the year 1904, except that it recites the assessed valuation for 1905 to be $53,000 with improvements and $50,000 unimproved, and omits paragraph 6 in the application for 1904.

Verification March 24, 1906.

2679 Block 1092, Lot No. 1.

The application for 1906 recites as follows:

BOROUGH OF MANHATTAN.

Application for Correction of Assessed Valuation of Real Estate.

Location of property, Volume 2, Section or Ward 4, Lot 1, Block 1092.

Assessed valuation 1906, $550,000, with improvements, $300,000, unimproved.

The undersigned represents that it is the owner of the above described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioner of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

There are five holders and a gas plant on this plot, which can only be used for the purpose of manufacturing and storing gas and which add nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $400,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sgd.) LEWIS B. GAWTRY, *V. P.*

Address, 4 Irving Place, New York City.

CITY OF NEW YORK, *County of New York:*

Lewis B. Gawtry, being duly sworn, says that he is the Vice-President of the Consolidated Gas Company of New York,
2680 the owner of the within-mentioned premises, and that the statements contained in this application for the revision and correction of the assessed valuation are true.

LEWIS B. GAWTRY. (Sgd.)

Sworn to before me, 29 March, 1906.

CHARLES D. IMMEN, JR.,
Notary Public, New York County.

Block 1093, Lot 1.

The application for the year 1904 recites as follows:

BOROUGH OF MANHATTAN.

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate comprising the greater part of the block between 45th and 46th

Streets and 11th and 12th Avenues, in Volume 2, of Section 4, of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 1, in Block 1093.

It finds that the same has been assessed on the Assessment Roll of 1904, at a valuation of $425,000 with improvements, and $250,000 unimproved, whereas the same should not have been valued at more than $410,000, to be in proportion to the assessed value of the adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over valuation, and is in excess of what the property would sell for under ordinary circumstances.

2681 It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the City.

The value of this lot has not increased since the second Monday in January, 1903. The assessed valuation for 1903 was $410,000, which sum represented the fair market value of the property. There is no apparent reason for the increased assessment this year.

The improvements are assessed for $175,000, which is greatly in excess of the sum for which the undersigned values and insures them.

It therefore asks that the assessed value of said premises for 1904 be fixed at $410,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1904.

The application for 1906 recites as follows:

Location of property.

Volume 2, Section or Ward 4, Lot 1, Block 1093.

Assessed valuation 1906, $425,000, with improvements, $250,000, unimproved.

The undersigned represents that — is the owner of the above-described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

2682 There are two gas holders and part of a gas plant on this plot, which can only be used for the purpose of manufacturing and storing gas and which add nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $250,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK,
(Signed) LEWIS B. GAWTRY, *V. P.*

Address, 4 Irving Place, New York City.
Verification March 29, 1906.

Block 1107, Lots Nos. 23 and 28.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate consisting of wharves or bulkheads lying at the foot of 45th and 46th Streets in Volume 2 of Section 4 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lots 23 and 28 in Block 1107.

It finds that the same have been assessed on the Assessment Roll of 1903 at a total valuation of $48,000 for each lot, whereas the same should not have been valued at more than $25,000 each, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The aforesaid assessment is illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The total assessed valuation of these lots for 1902 was $40,000. The valuation has been increased 140 per cent.

The value of said lot and the value of real estate in the
2683 same ward and section or in the same locality with the said
lot of the undersigned has not increased since the second
Monday in January, 1902.

The undersigned is informed and believes that the assessed valuation of real estate in the City of New York for the year 1903 exceeds that for the year 1902 by about 33⅓ per cent.

Even if such increased assessment were legal, any increase in the valuation of the said lots 23 and 28 in excess of 33⅓ per cent. is unfair, illegal and erroneous, and not in proportion to the valuation placed upon other real estate [illegible] like character in the same ward and section, and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $25,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for 1904 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate consisting of wharves or bulkheads, lying on the North River, between 44th and 45th Street- and 45th and 46th Streets, in Volume 2 of Section 4 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lots 23 and 28 in Block 1107.

It finds that the same have been assessed on the Assessment Roll of 1904 at a total valuation of $75,000, for each lot, whereas, the same should not have been valued at more than $25,000, each to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

2684 The assessments are illegal and erroneous by reason of overvaluation and are in excess of what the property would sell for under ordinary circumstances.

They are also illegal and erroneous by reason of inequality, in that they have been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The value of each of these lots has not increased since the second Monday in January, 1903. These lots were assessed for $48,000, each for 1903. There is no reason for the increased assessment.

In 1903, the undersigned filed an application requesting that the assessment be reduced to the sum of $25,000, for each lot, but no reduction was made, and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessments, which proceedings are now pending.

It therefore asks that the assessed value of the said premises for 1904, with improvements, be fixed at $25,000 for each lot.

CONSOLIDATED GAS COMPANY OF NEW YORK,
(Sgd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28, 1904.

Block 1157, Lot No. 1.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate, located between 10th and 11th Avenues and 65th and 66th Streets, in Volume 3 of Section 4 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 1 in Block No. 1157. 2685

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $1,050,000, whereas the same should not have been valued at more than $800,000 to be in proportion to the assessed value of adjacent property and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation; and it is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reasons of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

This property was assessed for the year 1901 and 1902 at a valuation of $800,000, and for 1900 at $700,000. There has been an increase of $250,000 without any reason. The property is used as a gas works and much of it consists of appliances useful only in the manufacture of gas and having no market value.

The total assessed valuation of Block 1158, which lies immediately to the north of said Block 1157, is $943,400, and that of Block 1156, which lies immediately to the south, is $475,800. Both of these blocks are of the same size as said Block 1157.

The total assessment of Block 1159 is only $898,000, while that of Block 1155 is only $822,000. The said Block 1157 should not be assessed at a higher valuation than any of the aforesaid blocks.

It therefore asks that the same may be reduced to the sum of $800,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28, 1903.

2686 The application for the year 1904 is substantially the same as the application for 1903, except that the valuation is stated to be $1,000,000 for 1904, and paragraphs 5 and 7 in the application for 1903 are omitted and the following is inserted in place of paragraph 6:

"Blocks 1155, 1156, 1158 and 1159, which lie immediately to the north and south of said Block 1157, are assessed, respectively, on a valuation unimproved at $430,000, $418,000, -430,000 and $477,000.

Verification March 28, 1904.

The application for the year 1905 recites substantially the same as the one for the year 1904, except that the assessed valuation for 1905 reads $1,000,000 with improvements, $500,000 unimproved and the following paragraphs are added:

"Since the second Monday of January, 1905, we have had the property appraised by skillful real estate experts, who value the land at $488,231.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $800,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,

4 Irving Place, New York City."
Verification March 24th, 1905.

Block 1177, Lot 21.

The application for 1904 recites the following:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate situated between 65th and 63th Streets, and 11th Avenue and the New York Central Railroad tracks, in volume 3 of Section 4, of the Borough of Manhattan of the City of New York, designated
2687 on the Tax Map as Lot No. 21 in Block No. 1177.

It finds that the same has been assessed on the Assessment Roll of 1904 at a valuaton of $140,000, whereas the same should not have been valued at more than $100,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the City.

The assessed valuation of this lot for the year 1903 was $100.000, which sum represented the fair market value of the property. There has been no increase in the value of the lot, during the past year and there is accordingly no reason for the increase of 40 per cent. in the assessment.

It therefore asks that the assessed value of the said premises for the year 1904 be fixed at $100,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
(Sgd.) LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28, 1904.

The application for the year 1905 is substantially similar, except that the assessed valuation is decidedly as follows:

Assessed valuation 1905, $140,000 with improvements; $130,000, unimproved.

Verification March 24, 1903.

2688 Block 1455, Lots Nos. 13, 14, 15, 16, 17 and 18.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate known as Nos. 421-433 East 60th Street, in Volume 4 of Section 5 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot Nos. 13, 14, 15, 16, 17 and 18 in Block No. 1455.

It finds that the same has been assessed on the Assessment Roll of 1903 at a total valuation of $30,000, whereas the same should not have been valued at more than $18,750, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal, unfair and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances, and is not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

The assessed valuation of these lots for the year 1902 was $15,000. The assessed valuation for this year is an increase of 100 per cent.

These lots are all vacant with the exception of Lot No. 18. On this lot there is a small wooden house.

Their market value and the value of real estate in the same ward and section, or in the same locality with the said lots has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York, for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation
2689 of the said lots Nos. 13 to 18 in excess of 33⅓ per cent. is
unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the amount of $15,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28, 1903.

Block 1455, Lots Nos. 20 & 21.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate known as Nos. —— 60th Street, in Volume 4 of Section 5 of the Borough of Manhattan of the City of New York, designated on the Tax Maps as Lots Nos. 20 and 21 in Block No. 1455.

It finds that the same has been assessed on the Assessment Roll of 1903 at a total valuation of $7,000, whereas the same should not have been valued at more than $4,375, to be in proportion to assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and in excess of what the property would sell for under ordinary circumstances, and is not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

2690 The total assessed valuation of these lots for the year 1902 was $3,500. The assessment for this year is an increase of 100 per cent.

These lots are both vacant and produce no income.

The market value of these lots and of real estate in same ward and section or in the same locality with them has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York, for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase on the valuation of said lots 20 and 21 in excess of 33⅓ per cent. is unfair, illegal and erroneous, and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $4,375.

CONSOLIDATED GAS COMPANY OF
NEW YORK,

Verified March 28th, 1903.

Block 1455, Lots Nos. 23, 24, 25, 26, 27 and 28.

The application for 1903 recites the following:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as Nos. —— Avenue A in Volume 4 of Section 5 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lots Nos. 23, 24, 25, 26, 27 and 28 in Block No. 1455.

2691 It finds that the same has been assessed on the assessment roll of 1903 at a total valuation of $30,000, whereas the same should not have been valued at more than $22,500, to be in proportion to the assessed values of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason *over* over-valuation and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The assessed valuation of these lots for the year 1902 was $18,000. The valuation for this year is an increase of 67 per cent.

Their value and that of other real estate in the same ward and section or in the same locality with them has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York, for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of said lots Nos. 23 to 28 in excess of 33⅓ per cent. is illegal and erroneous and not in proportion to the assessment of other real estate on the tax rolls of the city.

It therefore asks that the same may be reduced to the sum of $22,500.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28, 1903.

2692 Block 1455, Lot No. 29.

The application for the year 1903 recites the following:

To the Commissioner- of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. — Avenue A in Volume 4 of section 5 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 29 in Block No. 1455.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $7,500, whereas the same should not have been valued at more than $5,625, to be in proportion to the assessed valuation of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances, and is also not in proportion to that of other real estate in the same ward and section and other real estate upon the tax rolls of the city.

The assessed valuation placed upon this lot for the year 1902 was $4,500. There has been an increase of 67 per cent. without apparent reason.

This lot is vacant and unimproved in any way and produces no income.

The market value of this lot and of real estate in the same ward and section or in the same locality with them has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year — 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of the said lot No. 29 in excess of 33⅓ per cent. is unfair, illegal and
2693 erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $4,500.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28, 1903.

Block 1455, Lot No. 30.

The application for 1903 recites the following:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner — Real Estate known as No. 418 61st Street, in Volume 4 of Section 5 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 30 in Block No. 1455.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $4,500, whereas the same should not have been valued at more than $3,125, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

2694 The assessed valuation placed upon this lot for the year 1902 was $2,500. The valuation has been increased 80 per cent. without any apparent reason. This lot is vacant and produces no income.

The value of this lot and other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of the said Lot No. 30 in excess of 33⅓ per cent. is unfair, illegal and erroneous, and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $3,125.

2696 Block 1455, Lot Nos. 33, 34, 35, 36 and 37.

The application for 1903 recites the following:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate known as Nos. 422-32 E. 61st Street, in Volume 4 of Section 5 of the

Borough of Manhattan of the City of New York, designated on the Tax Map as Lot Nos. 33, 34, 35, 36 and 37 in Block No. 1455.

It finds that the same have been assessed on the Assessment Roll of 1903 at a total valuation of $22,500, whereas the same should not have been valued at more than $15,625, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the City.

The assessed valuation placed upon these lots for the year 1902 was $12,000. The valuation has been increased 80 per cent. without any apparent reason. These lots are all vacant and produce no income.

The value of these lots and other real estate in the same ward and section or in the same locality with them has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York, for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation 2697 of said lots in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $15,625.

CONSOLIDATED GAS COMPANY OF NEW YORK.
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28th, 1903.

The application for the year 1904, as to lots 13 to 37, being all those quoted for the year 1903 with the addition of lot 22, recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate occupying the entire eastern half of the block lying between East 60th and East 61st Streets, and First Avenue and Avenue A, in Volume 4, of Section 5, of the Borough of Manhattan, of the City of New York, designated on the Tax Maps as Lots Nos. 13 to 37, in Block No. 1455.

It finds that the same has been assessed on the Assessment Roll of 1904, at a total valuation of $144,000, with improvements, and $140,000, unimproved, whereas the same should not have been valued at more than $100,000 to be in proportion with the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessments are illegal and erroneous by reason of over-valuation and are in excess of what the property would sell for under ordinary circumstances.

They are also illegal and erroneous by reason of inequality, in that they have been made at a higher proportionate valuation than the assessment of other real estate of like character, in the 2698 same ward and section, and other real estate on the tax rolls of the City.

The value of these lots has not increased since the second Monday in January, 1902. The assessed valuations, however, have been increased all the way from 67 to 100 per cent.

In 1903, the said lots were assessed at a total valuation of $125,000. The undersigned filed an application requesting that the assessments be reduced, but not reduction was made and the undersigned has instituted *certiorari* proceedings in the Supreme Court of this State to reduce the said assessments, which proceedings are now pending. There is no reason for the increase in the assessment this year to a total valuation of $144,000, with improvements.

It therefore asks that the total assessed valuation of the above lots be reduced to $100,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,

Verification March 28, 1904.

The application for the year 1905 is substantially the same as that for 1904.

Verification March 24, 1905.

Block 1457, Lot No. 6.

The application for the year 1906 recites the following:

Location of property,
Volume 4, Section or Ward 5, Lot 6, Block 1457.
Assessed Valuation 1906, $225,000, with improvements; $125,000, unimproved.

The undersigned represents that it is the owner of the 2699 above-described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioner- of Taxes and Asessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

There is a gasholder on this plot, which can only be used for the purpose of manufacturing and store gas and which adds nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $125,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK,
(Signed) LEWIS B. GAWTRY, *V. P.*

Address, 4 Irving Place, New York City.
Verification March 29, 1906.

Block 1474, Lot No. 24.

The application for 1903 recites the following:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. — East 60th Street, in Volume 4 of Section 5 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 24 in Block No. 1474.

It finds that the same has been assessed on the Assessment Rolls of 1903 at a valuation of $20,000, whereas the same should not have been valued at more than $16,250, to be — proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

2700 The assessment is illegal and erroneous by reason of overvaluation and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The assessed valuation of this lot for the year 1902 was $13,000. The valuation for 1903 is an increase of 54 per cent.

This is a vacant lot which is unimproved in any way.

The value of the said lot and of other real estate in the same ward and section or in the same locality with it has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of the real estate in the City of New York, for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of said lot No. 24 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the amount of $16,250.

CONSOLIDATED GAS COMPANY OF NEW YORK.
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

The application for the year 1904 is substantially the same as the application for the year 1903, except that paragraphs 6 and 7 are omitted.

2701 Block 1643, Lots Nos. 56, 57, and 58.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate at Lexington Avenue and 116th Street in Volume 1 of Section 6 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lots Nos. 56, 57 and 58 in Block No. 1643.

It finds that the same have been assessed on the Assessment Roll of 1903 at a valuation of $47,000, whereas the same should not have been valued at more than $39,000 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character, in the same ward and section, and other real estate on the tax rolls of the City.

Lot 56 was assessed for the year 1902 at a valuation of $16,500. The assessment for this year is an increase of 52 per cent.

Lots 57 and 58 were assessed for the year 1902 at a total valuation of $15,500. The assessment for this year is an increase of 47 per cent.

These lots are all vacant and unimproved in any way and produce no income.

The value of these lots and of other real estate in the same ward and section or in the same locality with them, has not increased materially since the second Monday in January, 1902.

2702 The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York, for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal, any increase in the valuation of the said Lots Nos. 56, 57 and 58 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the amount stated.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28th, 1903.

Block 1670, Lot No. 1.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents it is the owner of Real Estate comprising the block bounded by 98th and 99th Streets and First and Second Avenues, in Volume 2 of Section 6 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 1, in Block No. 1670.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $500,000, whereas the same should not have been valued at more than $375,000, to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances. 2703

There is a plant for the manufacture of gas on this lot. It is very old and has practically no market value.

The property was assessed for the year 1902 at the sum of $300,000. The assessment for this year is an increase of 67 per cent.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the City.

The total assessed valuation of Block No. 1671, which is immediately to the north of the said Lot 1670 is only $271,000.

Block No. 1691, which is about half the size of Block 1670, is assessed at $150,000. The said lot of the undersigned should be valued at no higher rate than these two blocks. The improvements on both these blocks have a much higher market value than those on the said block of the undersigned.

The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of the real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal any increase in the valuation of the said lot No. 1 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

2704 It therefore asks that the same may be reduced to the sum of $375,000.

CONSOLIDATED GAS COMPANY OF NEW YORK.
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28th, 1903.

The application for the year 1904 is substantially the same as the one for 1903, except that paragraphs 5, 7, 8, 9, and 10 in the application for 1903 are omitted and the assessed valuation for 1904 is to be $450,000 with improvements, and $290,000, unimproved, and the following allegation appears:

"On this lot there is a plant for the manufacture of gas which is a very old one."

The application for the year 1906 recites as follows:

Location of Property, —.

Volume 2, Section or Ward 6, Lot 1, Block 1670.

Assessed Valuation 1906, $525,000, with improvements; $365,000, unimproved.

The undersigned represents that it is the owner of the above-described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

There are four gas holders and a gas plant on this plot, which can only be used for the purpose of manufacturing and storing gas and which add nothing to the amount for which the property would sell under ordinary circumstances.

2705 It therefore asks that the assessed value of said premises for the year 1906 be fixed at $365,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK,
(Signed) LEWIS B. GAWTRY, *V. P.*

Address, 4 Irving Place, New York City.
Verification March 29, 1906.

Block 1682, Lot No. 11.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate located on the west side of First Avenue between 110th and 111th Streets, in Volume 2 of Section 6 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 11, in Block No. 1682.

It finds that the same has been assessed on the Assessment Roll of 1903 as a valuation of $350,000, whereas the same should not have been valued at more than $250,000 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character, in the same ward and section, and other real estate on the tax rolls of the City.

2706 This lot was assessed for $200,000 for the year 1902. The valuation for this year is an increase of 75 per cent.

The only improvement this property consist of two gasholders. These gasholders have little or no market value.

The value of said lot and other real estate in same ward and section or in the same locality with it has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of the real estate in the City of New York for the year 1903, is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal, any increase in the value of said lot No. 11 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the city.

It therefore asks that the same may be reduced to the sum of $250,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28th, 1903.

The application for the year 1904 is substantially the same as for the year 1903, except that paragraphs 5, 7 and 8 in the application for 1903 are omitted and the assessed valuation for 1904 is decided to be $455,000, with improvements and $220,000, unimproved, and the following paragraphs are inserted:

The value of this lot has not increased since the second Monday in January, 1902. This lot was assessed for $200,000 for the year 1902. The valuation for this year is an increase of 127 per cent.

2707 There is no reason whatever for the increase in the assessment with improvements this year of $105,000.

Verification March 28, 1904.

The application for the year 1905 is substantially the same as the application for the year 1903, except that paragraphs 5, 7 and 8 of 1903 are omitted, and the assessed valuation is recited to be $455,000 with improvements, $220,000 unimproved, and the following paragraphs are inserted:

"The only improvements on this property consists of two gas holders, which are only useful for the purposes of the present holder and which, if the property were sold, would in all probability have to be removed to make room for other improvements.

Since the second Monday of January, 1905, we have had the property appraised by skillful real estate experts, who value the property at $192,955.

It therefore asks that the assessed value of said premises for the year 1905 be fixed at $192,955.

Name, CONSOLIDATED GAS COMPANY OF
NEW YORK,

Address, 4 Irving Place, New York City."
Verification March 24, 1905.

The application for the year 1906 recites as follows:

Location of Property, First Avenue, between 110th and 111th Streets.

Volume 2, Section or Ward 6, Lot 11, Block 1682.

Assessed valuation, 1906, $500,000, with improvements.

Assessed valuation, 1906, $275,000, unimproved.

The undersigned represents that it is the owner of the above described property and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected. 2708

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The only improvements on this property consist of two gas holders, which are only useful for the purposes of the present owner and which add nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $275,000.

Name, CONSOLIDATED GAS COMPANY OF
NEW YORK,
(Sgd.) LEWIS B. GAWTRY.

Address, 4 Irving Place, New York City.
Verification 29 March, 1906.

Block 1683, Lot Nos. 34 and 35.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of Real Estate known as No. —— East 112th Street, in Volume 2 of Section 6 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot Nos. 34 and 35 in Block No. 1683.

It finds that the same has been assessed on the Assessment Roll of 1903 at a total valuation of $5,000, whereas the same should not have been valued at more than $4,000 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

2709 It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation, that the assessment of other real estate of like character, in the same ward and section, and other real estate on the tax rolls of the City.

These lots were assessed for $3,000 in 1902. The valuation for this year is an increase of 43%.

These lots are vacant and unimproved in any way and produce no income. There is no reason for an increase in the assessed valuation.

The value of these lots and of other real estate in the same ward and section or in the same locality with them has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of the real estate in the City of New York for the year 1903 is about 33⅓% higher than for the year 1902. Even in such increased assessment were legal, any increase in the valuation of the said Lots Nos. 34 and 35 in excess of 33⅓% is unfair, illegal and erroneous, and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the city.

It therefore asks that the same may be reduced to the sum of $4,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verified March 28th, 1903.

The application for the year 1904 is substantially the same as the application for 1903, except that Pars. 6, 7 and 8 in the application for 1903 are omitted and that the application for 1904 alleges that the valuation for 1904 was $5,000 for each lot, and petitions that the assessments for 1904 be fixed at $4,000 for each lot. 2710

Verification March 28, 1904.

Block 1692, Lot No. 1.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate situate between 98th and 99th Streets and First Avenue and East River in Volume 2 of Section 6 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 1 in Block No. 1692.

It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $100,000, whereas the same should not have been valued at more than $81,000, to be in proportion to the assessed value of adjacent property and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid improvement is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the Tax Rolls of the City.

This lot was assessed for 1900 at a valuation of $65,000, and for the years 1901 and 1902 at a valuation of $81,000. The increase of the valuation to $100,000 is without any apparent reason. This lot is unimproved and is only used for the purpose of storing coal.

2711 The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

It therefore asks that the same may be reduced to the amount stated.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for the year 1904 shows substantially the same as the application for the year 1903, except that the assessed valuation for 1904 is stated to be $135,000, with improvements, and $130,000 unimproved, and the following is inserted in place of Pars. 5 and 6:

"The value of this lot has not increased since the second Monday in January, 1902, on which date it was assessed for $81,000. The valuation for this year is an increase of 66 per cent."

Verification March 28, 1904.

For 1905 the application is substantially the same as for the year 1904.

Block 1704, Lot No. 1.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate located between 110th and 111th Streets and First and Pleasant Avenues, in Volume 2 of Section 6 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 1 in Block 1704.

2712 It finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $350,000, whereas the same should not have been valued at more than $240,000, to be in proportion to the assessed value of adjacent property and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

It is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the city.

This lot is occupied by works of the company, which have been rendered useless, as the city has condemned the land in the block above on which a part of the same system of works was located. Accordingly this land no longer has a value as a gas plant and would not sell for more than the value of the land as vacant property.

The assessed valuation of this block for 1902 was $240,000. The valuation for this year is an increase of 40 per cent.

The value of said lot and of other real estate in the same ward and section or in the same locality with it has not increased materially since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal, any increase in the valuation of said Lot No. 1 in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in
2713 the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same be reduced to the sum of $240,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for the year 1904 is substantially the same as the one of 1903, except that it recites the assessed valuation of 1904 to be $350,000 with improvements, and $285,000 unimproved, and Pars. 7 and 8 of this application for 1903 are omitted and in place thereof is the allegation:

"The valuation of the improvements at $65,000 is therefore manifestly erroneous. The value of said lot has not increased since the second Monday in January, 1902."

Verification March 28, 1904.

The application for the year 1905 is substantially the same as the application for 1903, except that paragraphs 7 and 8 in the application for 1903 are omitted, and the application for 1905 recites the assessed valuation for 1905 to be $330,000 with improvements, $285,000 unimproved, and recites, "The value of this lot has not increased since the second Monday in January, 1902."

It also recites:

"The assessed valuation of this block for 1902 was $240,000. The valuation for this year is an increase of 38 per cent."

Since the second Monday of January 1905, we have had the property appraised by skillful real estate experts, who value the land at $240,295, and state that the buildings add nothing to the market value of the land.

2714 It therefore asks that the assessed value of said premises for the year 1905 be fixed at $240,000.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
4 *Irving Place, N. Y. C.*

Verification March 24, 1905.

The application for the year 1906 recites as follows:

Location of property, 110th and 111th Streets and First and Pleasant Avenues.

Volume 2, Section or Ward 6, Lot 1, Block 1704.

Assessed valuation, 1906, $330,000, with improvements; $285,000 unimproved.

The undersigned represents that it is the owner of the above-described property, and claims to be aggrieved by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation, and is in excess of what the property would sell for under ordinary circumstances.

This lot is occupied by gas works of the undersigned which have been rendered useless, as the city has condemned the land in the block above, on which a part of the same system of works was located. Accordingly, this land no longer has any value as a gas plant and would not sell for more than the value of the land as vacant property. The improvements add nothing to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $285,000.

Name, CONSOLIDATED GAS COMPANY OF
NEW YORK,
(Signed) LEWIS B. GAWTRY, *V.-P.*

Address, 4 Irving Place, New York City.
Verification March 29, 1906.

2715 Block 1999, Lot Nos. 1 to 27 and 39 to 64.

The application for 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of the real estate situated on Twelfth Avenue, between 132d and 133d Streets, in Volume 2 of Section 7 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot Nos. 1 to 27 and 39 to 64 in Block No. 1999.

It finds that the same have been assessed on the Assessment Roll of 1903 at a total valuation of $174,000, whereas the same should not have been valued at more than $145,000 to be in proportion to the assessed value of adjacent property, and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over valuation, and is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section, and other real estate on the tax rolls of the City.

The total assessed valuation of these lots for the year 1902 was $116,000. The total valuation for this year is an increase of 50% on each lot. They are all vacant. The Twelfth Avenue viaduct has depreciated the value of this property, as it interferes with the light on the property, and has had the effect of lessening the value of the property adjoining to it.

The value of real estate in the same ward and section or in the same locality with the said lot of the undersigned has not increased materially since the second Monday in January, 1902.

2716 The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about 33⅓% higher than for the year 1902. Even if such increased assessment is legal, any increase in the valuation of said lots in excess of 33⅓% would be illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the sum of $145,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for the year 1904 is substantially the same as the application for the year 1903, except Pars. 5, 6 and 7 in the application for 1903 are omitted and the assessed valuation for 1904 is recited to be $180,000, and the following paragraphs are added:

"These lots are all vacant and unimproved. Their total assessed valuation for the year 1902 was $116,000. The total valuation for this year is an increase of over 60%.

"The increased assessment to $186,000 is without any apparent reason.

"The Twelfth Avenue viaduct has depreciated the value of this property, as it interfered with the light, and has had the effect of lessening the value of property adjoining it."

Verification March 28, 1904.

The application for the year 1905 is identical with the applica-

2717 tion for the year 1904 with this exception, that the assessed valuation for 1905 is stated to be $208,500, and the following sentence is added:

"The total valuation for this year is an increase of over 79%. The increased assessment to $208,500 is without any apparent reason."

Verification March 24, 1905.

The application for 1906, including Lots 1 to 27, 39 to 64, heretofore recited, is as follows:

Location of property, Twelfth Avenue between 132d and 133d Streets.

Volume 2, Section or Ward 7, Lot 1, Block 1999.

Assessed valuation, 1906, $350,000, with improvements; $265,000 unimproved.

The undersigned represents that it is the owner of the above described property, and claims to be aggre*v*ied by the aforesaid assessed valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessments are illegal and erroneous by reason of over-valuation and are in excess of what the property would sell for under ordinary circumstances.

These lots are all vacant and unimproved, except that a gas holder is in process of construction on the lots, which will not, however, add anything to the amount for which the property would sell under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $265,000.

Name, CONSOLIDATED GAS COMPANY OF
NEW YORK,
(Signed) LEWIS B. GAWTRY, *V.-P.*

Address, 4 Irving Place, New York City.
Verification March 29, 1906.

2718 Block 2175, Lots Nos. 15, 22 and 100.

The application for the year 1903 recites as follows:

To the Commissioners of Taxes and Assessments:

The undersigned represents that it is the owner of real estate known as No. — Broadway, in Volume 1 of Section 8 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lots Nos. 15, 22 and 100 in Block No. 2175.

It finds that the same has been assessed on the assessment roll of 1903 at a total valuation of $29,000, whereas the same should not have been valued at more than $18,125, to be in proportion to the assessed value of adjacent property and in accordance with the marketable value thereof.

The assessment is illegal and erroneous by reason of over-valuation, and it is in excess of what the property would sell for under ordinary circumstances.

The aforesaid assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the City.

The assessed valuation of these lots for the year 1902 was $14,500. The assessed valuation for this year is an increase of 100 per cent.

The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuations of real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902. Even 2719 if such increased assessment were legal, any increase in the valuation of said lots in excess of 33⅓ per cent. is unfair, illegal and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the amount stated.

CONSOLIDATED GAS COMPANY OF
NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for the year 1904 is substantially the same as the application for the year 1903, except that paragraph 7 is omitted, and the assessed valuation for the year 1904 is recited to be $29,000 with improvements, and $28,000 unimproved.

Verification March 28, 1904.

Block 2175, Lot No. 18.

The application for 1903 recites the following:

To the Commissioners of Taxes and Assessments:

The undersigned represents that he is the owner of real estate known as No. — Broadway, in Volume 1 of Section 8 of the Borough of Manhattan of the City of New York, designated on the Tax Map as Lot No. 18 in Block No. 2175.

He finds that the same has been assessed on the Assessment Roll of 1903 at a valuation of $24,000, whereas the same should not have been valued at more than $15,000, to be in proportion to the assessed value of adjacent property and in accordance with the marketable value thereof.

2720 The assessment is illegal and erroneous by reason of overvaluation and is in excess of what the property would sell for under ordinary circumstances.

The assessed valuation of this lot for the year 1902 was $12,000. The valuation for 1903 is an increase of 100 per cent. The only improvement on this lot is a small gas holder, which has hardly any marketable value, and the cost of which was only a few hundred dollars.

The assessment is also illegal and erroneous by reason of inequality, in that it has been made at a higher proportionate valuation than the assessment of other real estate of like character in the same ward and section and other real estate on the tax rolls of the city.

Other lots in the same block which have a market value equal to said lot of the undersigned are assessed at a much lower rate than his said lot.

Lot 1, a much larger lot, situated at the corner of Sherman Avenue and Broadway, is assessed for only $16,000.

Lots 4, 6, 8, 10, 12, 27, 29, 31, 33, 35, 37, 39, 41, 43 and 45 are assessed from $6,000 to $8,000 each.

These lots have not as great a frontage as said lot of the undersigned but have a much greater depth, and his said lot should not be assessed at a sum three times that of these lots.

The value of this lot and of other real estate in the same ward and section or in the same locality with it has not increased since the second Monday in January, 1902.

The undersigned is informed and believes that the total assessed valuation of real estate in the City of New York for the year 1903 is about 33⅓ per cent. higher than for the year 1902. Even if such increased assessment were legal, any increase in the valuation of said Lot No. 18 in excess of 33⅓ per cent. is unfair, illegal 2721 and erroneous and not in proportion to the assessment of other real estate in the same ward and section and other real estate on the tax rolls of the City.

It therefore asks that the same may be reduced to the amount of $15,000.

CONSOLIDATED GAS COMPANY OF NEW YORK,
[SEAL.] LEWIS B. GAWTRY, *Vice-Pres.*

Verification March 28th, 1903.

The application for the year 1904 is substantially the same as the application for the year 1903, except that the following is inserted in place of Par. 4:

"The assessed valuation of this lot for the year 1902 was $12,000. The valuation for 1904 is an increase of 100%. The only improvement on this lot is a small gas holder, which has hardly any marketable value."

Paragraphs 6, 7, 8, 9 and 10 in the application for 1903 are omitted.

Verification March 28, 1904.

The application for the year 1905 is substantially the same as the application for 1904, except that the assessed valuation of 1905 is recited as follows:

"$24,000 with improvements, $12,000 unimproved."

Verification March 24, 1905.

Block 2175, Lot No. 14.

The application for 1906 recites as follows:

Location of property, Broadway.
Volume 1, Section 2, Ward 8, Lot 18, Block 2175.
Assessed valuation, 1906, $36,000, with improvements; $24,000 unimproved.

2722 The undersigned represents that it is the owner of the above described property and claims *it* to be aggrieved by the aforesaid valuation, and makes application to the Commissioners of Taxes and Assessments to have the same reviewed and corrected.

The grounds of its objections are as follows:

The assessment is illegal and erroneous by reason of over-valuation and is in excess of what the property would sell for under ordinary circumstances.

It therefore asks that the assessed value of said premises for the year 1906 be fixed at $24,000.

Name, CONSOLIDATED GAS COMPANY OF NEW YORK.

Address, 4 Irving Place, New York City.
Verification.

Adjourned at 5:50 P. M. to Wednesday, October 10, at 11 o'clock.

Last Exhibits:

Complainant's 256,
State's W,
City 54.

2723 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; **William Travers Jerome**, as District Attorney of New York County; **Frederick E. Gunnison**, **John C. Davies**, and **Lucian L. Shedden**, Constituting the New York State Commission of Gas and Electricity, and **The City of New York**, Defendants.

Before Arthur H. Masten, Special Master.

New York, *October* 10, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Meade.

2724 **John M. Thompson**, a witness called on behalf of City, being first duly sworn, testified as follows:

Direct examination by Mr. **Burr**:

Q. What is your business?
A. Real estate broker and appraiser.
Q. In the City of New York?
A. Yes, sir.
Q. How long have you been so engaged in the City of New York?
A. Fourteen years.
Q. Are you familiar with real estate in the Borough of Manhattan?
A. Yes, sir.
Q. Have you sold and appraised property throughout the Borough of Manhattan?
A. Yes, sir.
Q. Have you acted as an expert in any proceedings in giving testimony as to the value of property in Manhattan?
A. Yes, sir; quite a number.
Q. Will you mention a few of them?
A. I was retained by the City in the 69th Regiment Armory site; Bellevue site, 28th and 29th Street, the Bulkhead; at Fourth Avenue and 8th Street, Rapid Transit; Harlem Hospital site; Chelsea Park, Ninth Avenue, 27th and 28th Street; North River Docks, 18th to 22d Street; and a number of school sites and street opening proceedings.
Q. Blackwell's Island Bridge?
A. Blackwell's Island Bridge, also, yes, sir; the Anchorage of Blackwell's Island Bridge; and *certiorari* proceedings for the City in the Produce Exchange Building, Mutual Reserve Fund Life Association Building. I have appraised for the estate of William Astor, Robert Goelet, John Jacob Astor, the estate of John Inman, the estate of Abram S. Hewitt, the estate of Edward Cooper, the estate of John

Roach, the estate of Nicholas Low; and I have appraised for the
United States Mortgage & Trust Company, Parsons, Closson
2725 & McIlvaine; Einstein, Townsend and Guitterman; Carter,
Ledyard and Milburn; Consolidated Gas Company; Sherman
& Sterling, or, John W. Sherman rather; and others.

Q. Have you examined the diagram or Exhibit No. 48 in this case?

A. Yes, sir.

Q. Have you read the testimony in this case in regard to the real estate appearing upon that Exhibit?

A. Some of it, yes, sir.

Q. Are you familiar with the properties mentioned and described on Exhibit 48?

A. Yes, sir.

Q. Have you made an examination of such property?

A. Yes, sir. Part of it I made two years ago, and I then looked it over again this year and some new pieces have been added since I appraised it two years ago.

Q. Are you familiar with the value of that property?

A. Yes, sir.

Q. As such property appeared upon Exhibit 48?

A. Yes, sir.

Q. Now taking Exhibit 48, page 1, Block 1643, Lots 56, 57 and 58?

A. Yes, sir.

Q. Just give the frontage and identify it in each case. Will you locate that and give the dimensions of it?

A. Southwest corner of Lexington Avenue and 116th Street, vacant with the exception of a one-story frame shanty on the corner used as a news stand; the dimensions are 80 feet on 116th Street by 100 feet 11 inches on Lexington Avenue, containing a total area of 8,073.60 square feet.

Q. How many lots are there in that?

A. There is a fraction over three lots; three and one-fifth lots.

Q. What in your opinion is the value of that plot or parcel?

A. $84,386.40.

Q. The next parcel is Block 1642?

A. Yes, sir. Northwest corner of 114th Street and Third Avenue,
two three-story brick buildings occupied as offices, and on
2726 114th Street there is a three-story brick building occupied
as an office and for the sale of gas ranges. The dimensions
are 25 feet 2¾ inches front on Third Avenue by 150 feet 5 inches deep on 114th Street. The first lot is 25 feet 5 inches in front by 100 feet 11 inches in depth; the second lot is 25 feet front by 100 feet 11 inches in depth.

Q. 150 feet 5 inches deep, did you say?

A. Yes, sir.

Q. In the rear?

A. Yes, sir.

Q. How many lots are there in that parcel?

A. Three lots and a small fraction.

Q. What is the value in your opinion of that parcel?
A. (See correction on P. 2747 $74,104.) $89,104.00.

By Mr. Mathewson:

Q. Will you state in each case whether that includes buildings where there are buildings, Mr. Thompson?

By Mr. Burr:

Q. I understood you to say in parcel 1643 there are no buildings but a news stand?

A. No, sir; it was vacant. Block 1642, land $74,104.00; (see correction on P. 2747 $59,104.00) buildings $15,000.00.

Q. Take the next parcel appearing upon page 1 of Exhibit 48, Block 870 and give the dimensions, if you please?

Mr. Mathewson: That is at the corner of Irving Place and 15th Street?

The Witness: **Yes, sir.**

A. Southeast corner of Irving Place and 15th Street, 84 feet wide on Irving Place, 155 feet 6 inches on 15th Street. No. 4 Irving Place, corner building, three-story and basement brownstone 2727 building. No. 2 Irving Place is a five-story brownstone building. Both of these buildings were formerly residences and have been converted into offices for the gas company. No. 124 East 15th Street, situated on the southerly side of 15th Street, distance 92 feet easterly from Irving Place, being a plot 50 x 84; improvement on westerly lot, four-story and basement brick building; and No. 124 East 15th Street is a four-story brick cellar and basement old dwelling with brownstone window lintels and coping, now used by the Consolidated Gas Company in connection with their Irving Place office. Cellar flagged and contains furnace for heating the building. Divided into two rooms, two store rooms and closets and in the rear are two toilets and one marble-topped sink with running water. First floor divided into two rooms, used as offices. Ceilings in both rooms are finished with hardwood. In the hallway of the first floor, one iron sink with running water; building heated by steam. Second floor——

The Master: Do you think it is necessary to go into a detailed description of the physical condition of the buildings?

Mr. Mathewson: No, sir.

Mr. Burr: I understand Mr. Mathewson does not care for the full description of the property. We are all familiar with the situation as it is there.

The Witness: All right, sir.

Q. Did you examine that property carefully?
A. Yes, sir.

Q. And what in your opinion is the value of that parcel, Block 870, giving your valuation first as to buildings, and then as to the land?

A. The land $196,491.20; buildings $27,000.

Q. Making a total of how much?

A. $223,491.20.

2728 Q. Now please turn to Block 239 on page 1 of Exhibit 48?

A. Northeast corner of Elizabeth and Hester Streets, 100 feet on Hester and 159 feet on Elizabeth. On the Hester Street front there is a two and one-half story and basement gable roof brick building setting back about 25 feet——

Q. You need not give the description——

A. All right, sir.

Q. Just describe what the parcel is, buildings and land and the dimension and the estimate?

A. Yes, sir, buildings and land. The land is $167,500.00. The buildings add nothing to the market value of the land.

Mr. Burr: I think that is all on page 1, Mr. Mathewson.

Mr. Mathewson: Yes, I think so.

Q. Now turn to page 2 and take up Block 972?

A. Block 972, situated on the southerly side of 15th Street, distant 350 feet westerly from Avenue B; it is an irregular shaped plot having a frontage of 13——

By Mr. Mathewson:

Q. Are you not mistaken in saying it is 350 feet westerly from Avenue B? Isn't it 300 feet?

A. It should be 300 feet westerly from Avenue B. It is an irregular shaped plot having a frontage of 13.25 feet on 15th Street, a depth of 106.70 on its easterly end. The property is practically vacant. The valuation of the land is $12,279.37. The buildings add nothing to the market value of the land.

Q. Now take Block 985?

A. The property has a frontage of 184 feet of Avenue C, extending back 350 feet on 17th Street and 350 feet on 18th Street. I would like to correct that description. It has a frontage of 2729 350 feet on 18th Street and 350 feet on 17th Street. It is practically vacant. It has a small frame power house and two gasometers on it. Part of it is leased as a lumber yard to Myer Hellman. There is a coal hoist on the easterly end. The value of the land is $196,000.00. The buildings add nothing to the value of the land.

Q. Now take up Block 982, on page 2 of the Exhibit?

A. It has a frontage of 206.50 feet on Avenue C; 434 feet on 15th Street and 434.87 feet on 14th Street. On Avenue C front there are one-story brick buildings. On the balance of the plot there are gasometers. The buildings add nothing to the market value of the land.

Q. What is the value of that parcel?

A. There are some other buildings. There are six gasometers altogether, several one-story brick buildings, a one and one-half story brick building; most of the buildings used as purifying buildings. The value is $240,436.58.

Q. Now the next parcel is Block 989, Lot 1, on page 2 of the Exhibit.

A. 989 has a frontage of 208 — Street and East 16th Street; there are 206 feet 6 inches on Avenue D by 191 feet on East 16th

Street *feet on Avenue D by 191 feet on East 16th Street* and 191 feet on East 15th Street.

Mr. Mathewson: Is that the property?

The Witness: 989.

Mr. Mathewson: I think you are giving 989, lot 26.

The Witness: You want those given separately? I have not got them separately.

Q. Take the property you first gave.

A. Avenue C?

Q. Yes.

A. 206 feet 6 inches on Avenue C by 235 feet on East 16th
2730 Street and 235 feet on East 15th Street.

Q. Are there buildings on that plot?

A. I have taken those buildings in the entire two parcels. I think I can separate them. Avenue C has two large gasometers and two one-story brick buildings, one of them new. That is all I have on that parcel.

Q. What is the value of that lot?

A. I will have to give you that after lunch. I have only got that totalled.

Q. You have totalled the two lots appearing on this exhibit as Block 989?

A. Yes, sir.

Q. Will you give us the total value of both, and afterwards separate them?

A. $231,058.60, land only.

Q. Take up Block 991 on the same page.

A. Which 991 is that? There are two.

Q. 991, between 15th Street, 16th Street, Tompkins Street and Avenue D.

A. Comprising the entire block between East 15th Street and East 16th Street, Avenue D and Tompkins Street, having a frontage of 206 feet 6 inches on Avenue D and 159.16 feet on East 16th Street, 226.02 feet on Tompkins Street, 251.56 feet on East 15th Street. There are several one-story buildings which add nothing to the market value of the land, the property being used principally for the storage of coal, etc. The value of land only, $115,683.27.

Q. What if any value have you added for the buildings?

A. I have said land only.

Q. You have that on your memorandum as 991-B?

A. That was 991-B that I gave you then, yes, sir.

Q. Now take the other portion of Block 991 bounded by 15th Street and 14th Street, Tompkins Street and Avenue D.

A. Comprising the entire block between 14th Street and 15th Street, Avenue D and Tompkins Street; the frontage on Ave-
2731 nue D being 206.50 feet and on East 14th Street 371.08 feet and on Tompkins Street 224.20 feet and on 15th Street 278.58 feet. The property is vacant and is used for storing coal, wagons, etc. There are some coal elevators on both 15th Street and 14th Street sides, small boiler house on the corner of Avenue D, the balance being coal sheds. Small one-story building on Avenue D

and Tompkins Street. Small one-story building on the corner of 14th Street and Tompkins Street. Small building on Avenue D and 15th Street.

Q. What is the value of that parcel?

A. Land only $167,536.92.

Q. Take Block 988.

A. Comprising the entire block between East Fourteenth Street and East Fifteenth Street, Avenue C and Avenue D, it has a frontage of 206.50 feet on each avenue and 676 feet on each street. There were quite a number of buildings on this property used for gas purposes which add nothing to the value of the land.

Q. That is the block bounded by 14th Street, 15th Street and Avenue C and Avenue D?

A. Yes, sir. Steel towers and offices, engine rooms, boiler rooms, machine shops, retort buildings and such things.

Q. What is the value of that parcel?

A. Land $370,754.63.

Q. Calling your attention to the block on page 3 of the Exhibit, will you take up Block 688, bounded by West 16th Street, 17th Street, Tenth Avenue and the marginal street?

A. Comprising the entire block with a frontage on the marginal street of 197.26 feet, on Tenth Avenue of 184 feet, on 17th Street of 357.29 feet and on 16th Street of 286.20 feet. The property is vacant.

Q. What is the value of that parcel?

A. Land $322,187.20.

Q. Take Block 689, Lot 17.

2732 A. Comprising the entire block bounded by the marginal street, Tenth Avenue, 17th and 18th Streets, having a frontage of 197.26 feet on the marginal street, 380.47 on 17th Street, 184 feet on Tenth Avenue, 451.55 feet on 18th Street. The Tenth Avenue front has a one-story brick building, extending back on both sides about 100 feet. Two steel towers in the rear of this building; in the center of the block on 18th Street, two small brick offices and a one-story brick building on 17th Street and one two-story brick building. The buildings add nothing to the market value of the land. The value of the land only, $402,347.20.

Mr. Mathewson: All these blocks in this vicinity you are giving as they are now improved?

The Witness: Yes, sir, after the City improved them. I appraised them at the time the City improved them.

Q. The next parcel is 690.

A. Comprising the entire block, marginal street and Tenth Avenue, 18th and 19th Streets. Frontage of 139.48 feet on the marginal street, 474.73 feet on 18th Street, 184 feet on Tenth Avenue—I am mistaken about its being the entire block. There are some lots out on 19th Street.

Q. What lots are out on 19th Street?

A. 150 feet easterly from the marginal street there are two lots out; 250 feet easterly from the marginal street there is one lot out; 150 feet westerly from Tenth Avenue there are two lots out.

Q. Altogether there is 125 feet out on that block, is that it?

A. Yes, sir, 125 feet out on 19th Street. There are two gasometers and one one-story brick building. On 19th Street there is also a wagon yard near the marginal street end. The land value is $413,822.52.

Q. Take Block 691.

2733 A. Located on the easterly side of the marginal street between 19th and 20th Streets, the entire block front on the marginal street; 190.08 feet on 20th Street; 119 feet on 19th Street. The plot is vacant with the exception of two disused gasometers. The value is $164,479.20. In making this statement that they are disused gasometers, they have no gas in them; I don't know that they are entirely disused, but on my two examinations there was no gas in them.

Q. I notice that in the testimony of Mr. Wheelock he gave the description of this Block 691 as being a portion of the block bounded by 11th Avenue, 19th Street and 20th Street, being 184 feet on 11th Avenue and 350 feet on each street, and in the easterly line being 184 feet.

Mr. Mathewson: May I say here, so there need be no confusion, that the values given by Mr. Wheelock as to Blocks 688, 689, 690 and 691 were all values for the entire blocks, before anything had been taken by the City, and the testimony of Mr. Preuss was given on the same basis, but he subsequently gave on cross-examination his values for what was left also, and this witness is giving simply the value of what is left. They are still carried on our books as real estate so long as they have not been paid for by the City and their value not fixed.

Q. You have followed in your examination of these parcels the Exhibit No. 48, have you?

A. Yes, sir.

Q. As offered in evidence here?

A. Yes, sir.

Mr. Mathewson: Exhibit 49, a single sheet, if the counsel will remember, shows the property before the changes were made on account of the City improvements.

2734 Q. Take up Block No. 716.

A. North side of 18th Street, 175 feet east of 10th Avenue; two old two-story brick buildings which add nothing to the market value of the land. The value of the land $36,000.

Q. Take Block 715.

A. South side of 18th Street, 150 feet east of 10th Avenue, 225 feet by 92 feet. There is an old two-story building on the property which adds nothing to the value of the land. The value of the land, $108,000.

Q. Turn to page 4 of the Exhibit and take up Block 951.

A. South side of East 20th Street, between Avenue A and First Avenue. Three-story brick stable built front and rear and on easterly side with an open court in the center. Value of land $49,000, and the building adds to the market value of the land $10,000; total $59,000.

Q. Take the large plot between 20th and 21st Streets, First Avenue and Avenue A, Block No. 952.

A. It is the entire block front on Avenue A by 517 feet on 20th Street and 517 feet on 21st Street. On the corner of Avenue A and 21st Street is a two-story brick machinery building which is used for gas purposes, but adds about $8,000 to the market value of the land, as it could be used for other purposes. 327 Avenue A is a four-story brick building and is leased and used as a storage house. 333 is a four-story brick tenement 20-foot front, occupied by two families, employees of the gas company. 335 Avenue A is an old four-story brick building which I think is also occupied by employees of the gas company, but of this I am not sure. The value of the land is $313,520. The buildings add to the market value of the land $20,000; total $333,520.

Q. Take Block 953.

A. Comprising the entire block between 21st and 22d Streets, First Avenue and Avenue A. There is 197.50 feet frontage on
2735 each avenue and 613 feet on each street. Avenue A front is
occupied by gasometers and First Avenue front by one and two-story brick buildings extending part of the way from First Avenue. The balance of the block is occupied by gasometers. 21st Street side of the property, near Avenue A, by one-story brick buildings. On the north corner of 21st Street and First Avenue is a two-story gabled building, on the street there are gasometers. Two-story building in the center of the block about 15 feet wide. The balance two and one-story brick buildings. On the corner of 22d Street there is a building used for gasometer repair shop and storage of gas stoves.

Q. Any vacant land there?

A. No, sir, except spots of it, of course. The buildings add nothing to the market value of the land and the land value is $403,000.

Q. The next parcel is Block 979 on the same page, page 4 of the Exhibit.

A. 979, comprising the entire block between Avenue A and the marginal street, 21st and 22d Streets. It has the entire block frontage on the marginal street, 197.50 feet on Avenue A, 594.58 feet on 22d Street, 760.25 feet on 21st Street, occupied by buildings used for gas purposes. Land value of the property $338,086.

Q. The next parcel is 978.

A. Comprising the entire block bounded by Avenue A and Avenue B, 20th and 21st Streets, with the exception of 23 feet by 100 feet on Avenue A. 326 Avenue A, corner 21st Street, is a four-story tenement; store on the first floor is vacant. 328 and 330 Avenue A, five-story tenements, old-fashioned houses, two families on a floor. Balance of the block used for gas purposes. Value of the land $326,518.60. The value of the buildings not used for gas purposes $12,000; total $338,518.60.

2736 Q. The next parcel is 987. That is the irregular plot between the marginal street and Avenue B, 20th Street and 21st Street.

A. It has a frontage on Avenue B of 184 feet, on the marginal street 240.10 feet, on 20th Street 238.78 feet, on 21st street 84.54 feet, and is vacant land. The land value, $83,873.96.

Q. These are all the parcels on page 4?

A. Yes, sir.

Q. Now take on page 5, Block 1090.

A. North side of 42d Street, 100 feet west of 11th Avenue, six lots. There are one and two-story brick buildings which add nothing to the value of the land. Land value $72,000.

Q. Next take Block 1071.

A. Four lots on the north side of 42d Street, 225 feet east of 11th Avenue, vacant land. Value $52,000.

Q. Take Block 1070.

A. North side of 41st Street, 200 feet east of 11th Avenue, 8 lots with one-story brick buildings on the property which add nothing to the market value of the land. Value $80,000.

Q. Now take the large parcel, Block No. 1089, between 41st and 42d Streets, west of 11th Avenue.

A. Comprising the entire block between 11th and 12th Avenues, 41st and 42d Streets, to 12th Avenue as proposed, having a frontage on 11th Avenue of 197.50 feet by 800 feet on each street. Four gasometers. Balance of the block occupied by one-story brick building used for gas purposes and one-story frame building. The buildings add nothing to the value of the land. I have three valuations on this property.

Q. Let us have them?

A. Assuming that the City owns 12th Avenue, the land value is $599,500; assuming that the gas company owns 12th Avenue and that 12th Avenue is upland at that point, the value is $779,500; assuming that the gas company owns 12th Avenue and that it is land under water, the value is $699,500.

2737 By Mr. Mathewson:

Q. That does not include the bulkhead and pier there, does it?

A. It does not.

By Mr. Burr:

Q. Now take the block appearing on page 6 of the Exhibit, between 44th and 45th Streets?

A. Block 1092 has frontage of 675 feet on 45th Street and 700 feet on 44th Street. This block is used for gas purposes with the exception of three tenements which are occupied by employees of the gas company. Then there is also a small frame tenement, 645 West 44th Street, which has no value. The value of the buildings on this property is $4,500. The same condition exists there. If the City owns 12th Avenue, the land value is $426,500, or a total with the buildings of $431,000. If the gas company owns 12th Avenue, the land value is $581,500, or a total with the buildings of $586,000. I have taken the figures of Mr. Wheelock and Mr. Preuss, who considered it as upland, and I have taken it as upland and have not considered it as land under water.

Mr. MATHEWSON: This does not include bulkhead?
The WITNESS: No, sir.

Q. Take the block between 45th and 46th Streets.

A. Block 1093 has a frontage of 575 feet on 45th Street and 500 feet on 46th Street. Gasometer and one-story brick buildings and frame building. One-story office building. They add nothing to the market value of the land. If the City owns 12th Avenue, the value is $332,500; if the gas company owns 12th Avenue, the value is $487,500, 12th Avenue having been treated as upland, the bulkhead not included.

Q. Take the block appearing on page 7 of the Exhibit,
2738 Block 1457.

A. 1457, the property is situated between First Avenue and Avenue A.

Q. Between 62d and 63rd Streets?

A. Yes, sir, with a frontage on the north side of 62d Street of 266.56′ and 216′ 5¾″ on 63d Street. It is occupied by two gasometers and one in process of construction. They add nothing to the value of the land. Nineteen and one-fourth lots, $154,000.00.

Q. The next parcel is Block 1455, between 60th and 61st Streets and Avenue A.

A. It has a frontage on Avenue A of 281.33 feet, 313 feet, each on 60th and 61st Streets. The property is vacant with the exception of two old frame buildings which add nothing to the value of the land. The grade of the street is very steep at this point and there is considerable rock on the plot. The value is $194,000.

Q. The next is Block 1474, an irregular piece at the corner of Avenue A and 60th Street.

A. It is an irregular parcel, northeast corner of Avenue A and 60th Street, containing about 5,230 square feet vacant. The value is $26,150.00.

Q. The next parcel is Block 1177 ap-earing on page 8 of the Exhibit, west of West End Avenue.

A. Block 1177 is a block bounded by West End Avenue, the New York Central & Hudson River Railroad, 65th and 66th Street, and has a frontage of 200.83 feet on West End Avenue, 206 feet on New York Central Railroad, 299.75 feet on 65th Street and 343.75 feet on 66th Street. One-story brick building on the plot which adds nothing to the market value of the land. The valuation is $172,-719.60.

Q. Take the other parcel on the same page, Block 1157 between 65th and 66th Streets, West End Avenue and Amsterdam Avenue.

A. It has a frontage of 200.83 feet on Amsterdam Avenue and
West End Avenue and a frontage of 800 feet each on 65th and
2739 66th Streets. It is the entire block. Some small two-story
brick buildings and gasometers on the property which add nothing to the marget value of the land, the land value being $602,844.00.

Q. The next piece is a small piece on the south side of 65th Street. Block 1156, between Amsterdam Avenue and West End Avenue.

A. It is 100 feet by 100 feet on the south side of 65th Street and

300 feet west of Amsterdam Avenue. Four-story brick tenement, two families on a floor, in fairly good condition. The westerly lots are vacant. Land $32,000; the buildings add to the market value of the land, $8,000; total $40,000.

Q. The next parcel appears on page 9, being the plot between 98th and 99th Streets, First and Second Avenue, Block 1670.

A. Comprising the entire block between First and Second Avenue, 98th and 99th Street, fronting 201.83 feet on each avenue, 650 feet on each street. The First Avenue frontage is vacant. The easterly portion of the property has one-story brick buildings; westerly portion gasometers. There are four gasometers, three on 98th Street and one on 99th Street. On 99th Street are small two-story brick buildings. Two of these buildings were used for gas purposes. There were quite a number of them. They add nothing to the market value of the land. The land value is $496,576.00.

Q. Take the parcel appearing on the same page bounded by First Avenue, the marginal Street, 98th and 99th Streets, Block No. 1692.

A. Comprising the entire block fronting 212′ on the marginal Street, 201.83′ on First Avenue, 270.24′ on 98th Street 370.57′ on 99th Street. This property is used mostly for the storing of coal. There is a slip on the 98th Street side extending from the East River
to a point about 150′ east of First Avenue and used for dock-
2740 ing barges east of First Avenue, and at this point First Ave-
nue has not been used except for storage of lumber, the balance being used for the slip. The southeast corner of 99th Street and First Avenue is a brick building used by some of the employees, and of no material value. The balance is vacant except for racks for holding coal. The improvements add nothing to the market value of the land. The land value is $201,358.00.

By Mr. Mathewson:

Q. That included no bulkhead or pier values?

A. No, sir.

By Mr. Burr:

Q. Take Block 1683, 111th and 112th Streets, First Avenue and Second Avenue.

A. Block 1683, three lots on the northwest corner of First Avenue and 111th Street, five lots on the rear on 111th Street and two lots on 112th Street, vacant with the exception of small brick building in the rear of the lot facing on 111th Street, which adds nothing to the market value of the land. The land value is $109,644.

Mr. Burr: When you spoke of parcel 1692, there is no bulkhead property there claimed by the company is there?

Mr. Mathewson: I merely asked the question on account of the witness' statement that part of the street was used as a slip by the Company for scows and barges.

The Witness: No, sir, 99th Street is used, the slip runs up 99th Street and crosses the bulkhead property.

Q. Now take Block 1682 between 110th and 111th Streets, First and Second Avenues.

2741 A. The entire block fronting on First Avenue, 475′ on 111th Street, 475′ on 110th Street. The land value $395,288. It does not take the entire block. There are two gasometers and one small building on the property which add nothing to the value of the land.

Q. The next parcel is Block 1704, being the entire block between Pleasant and First Avenues, 110th and 111th Streets.

A. Comprising the entire block having a frontage of 201.83′ each on First Avenue and Pleasant Avenue and 613′ each on 110th and 111th Streets. There are a number of small buildings on this property, two-story brick buildings, 1½-story frame building, frame shop with asphalted floors and old retort house not now in use; 1½-story building, slate roof, used as a blacksmith shop; 1½-story building on 110th Street used as a coal house. Opposite the coal house there is a small brick shop. The balance of the block is taken up with old frame shops and an old tramway structure leading to the docks which is not now in use. The entire block has been abandoned for gas use and is used by the Street Department of the gas works. These buildings add nothing to the value of the land. The value is $396,784.00. This does not include the bulkhead.

Q. The next parcel appears on Page 11, Block 1999.

A. Frontage on Twelfth Avenue of 199.83 feet, on 132d Street 675 feet, on 133d Street, 650 feet. This property is vacant. The grade of the street at this point is about ten per cent. from Broadway to Twelfth Avenue. On the Twelfth Avenue front is Riverside Viaduct and on the Broadway front is the subway viaduct. The property is from 12 to 15 feet below grade. Value $397,800.

Q. Take up Block 2175 on page 12 of the Exhibit.

2742 A. The property is situated at Broadway near the junction of Sherman Avenue and contains about 65,253 square feet. There are no improvements on the property except a small brick house and gasometer which add nothing to the value of the land. The land value is $97,879.50.

Q. Was there any other piece that you valued?

A. None except Shady Side and the bulkheads.

Q. Now, leaving out Shady Side and the bulkhead property, what do you find the total valuation of the property to be?

A. Mr. Burr, I would like to let that go until I come back from lunch. I find my stenographer has made a typographical error in here which makes a few hundred dollars' difference.

Q. Just prepare it so you can give it, assuming that the Company owns the marginal street and takes in the other assumption you have stated.

A. Yes, sir, I have done that but there is a mistake here in some of the figures.

At this point a recess was taken until 2 p. m.

After Recess.

The Master states that he has received from Judge Lacombe the following memorandum regarding recent motions made by the defendants for certain inspection of the books:

"The motion for inspection of plant was settled by consent, complainant offering such inspection, and therefore calls for no discussion. As to the suggestion that there should be some postponement because such inspection was not accorded earlier; the difficulty is that it was not accorded sooner because the Court was not asked to intervene. As far back as the latter part of August the Circuit Judge came to the city to pass upon such application (among others) but it was postponed and subsequently withdrawn. As to the books and records, the Master has full power, and the subject should be left with him, who fully understands the situation. Wherever it appears that any testimony or exhibits or tabulation introduced by complainant is founded on entries in the books, etc., such entries will of course be produced. Moreover as to any specific fact which defendants wish to show which can be shown only from entries in the books, etc., the particular entries required to prove such fact may be produced or inspection thereof allowed. 2743

"E. H. LACOMBE,
"U. S. C. J."

Oct. 10, 1906.

John M. Thompson resumes the stand.

Direct-examination (continued):

By Mr. Burr:

Q. Will you give the total valuation of the real estate of the Consolidated Gas Company?

A. The subdivision of Block 989, Lot No. 1, $131,527.75; Lot No. 26, $99,530.85.

By Mr. Mathewson:

Q. That makes a total of $231,058.60?

A. Yes, sir.

By Mr. Burr:

2744 Q. Now will you give your total valuation of the property, Mr. Thompson, aside from Shadyside and the bulkhead property?

A. Assuming the city owns Twelfth Avenue, the value is $9,637,908.55.

In Block 1089 if the Company owns Twelfth Avenue and assuming it is upland, $180,000 added to this block. Block 1092 if the Company owns Twelfth Avenue, assuming it is upland, $155,000. In Block 1093, if the Company owns Twelfth Avenue, assuming it is upland, $155,000.

By the Master:

Q. That is another $155,000?

A. Yes, sir. That is Block 1093. Or a total of $490,000, and a grand total of $10,127,908.55. If the land in Twelfth Avenue in Block 1089 is land under water, deduct $80,000, leaving $10,047,908.55.

Mr. Burr: That is all.

Mr. Mathewson: You do not intend to examine this witness on bulkheads?

Mr. Burr: No, not now. We are going to take up the bulkheads as a separate proposition.

Cross-examination by Mr. Mathewson:

Q. What is your age, Mr. Thompson?

A. Forty-two years.

Q. How long did you say you had been inthe real estate business?

A. In New York City?

Q. Yes.

A. Fourteen years.

Q. Where were you in business before that?

A. Nashville, Tennessee, for about four years.

Q. Have you ever been in any partnership or firm dealing in real estate in New York?

A. I am now, yes sir, John M. Thompson& Company.

Q. Who are your partners?

A. It is a corporation. I am president of the Company.

2745 Q. Any other partner or concern heretofore?

A. Yes, sir.

Q. Will you state?

A. Why, I had a partner, Mr. Williams, that was about 1897.

Q. What Williams?

A. Mr. Edgar C. Williams, 1898 and 1899 I had Mr. Samuel Pryor. Then I was alone, I think, until my present partnership or corporation with Mr. Burton Thompson.

Q. Where is your office?

A. 212 Broadway.

Q. Have your activities been chiefly in appraising real estate or in buying and selling?

A. Why, I think it has been about equally divided, sir.

Q. Have you ever sold any bulkhead property?

A. Yes, sir.

Q. Where?

A. I was interested in the sale of bulkhead property at the corner of 49th Street and North River in this way: that it was sold by Mrs. M. Ryan to Judge Dugro. At the time Mrs.Ryan's son Vincent O. Ryan was an employee in my office and I asisted in the sale. The property was sold under contract. The title has never passed for there is a squatter on the property, and they have not been able to get rid of him.

Q. Have you had charge of any of the sales of dock or bulkhead property?

A. I have had no other sales, no, sir, buthave had with the exception of bulkhead property in Long Island City opposite 34th Street; those are the only cases I have had for sale.

Q. What class of property have you been engaged in buying and selling?

A. Why, I have sold generally, sir, business buildings, apartment houses, residences and vacant property.

Q. What part of the Island particularly?

A. I sold all the way from I think Liberty Street on the south to—I can refer to my memorandum, sir, and tell you exactly—(after referring to memorandum) to 210th Street on the north.

2746 Q. Have you not operated more particularly in some special part of the city?

A. Why, no, sir. I should say that in a majority of my sales they have been south of 14th Street and north of 23d Street. I have not done much in the wholesale dry goods district.

Q. Will you take Block 1643, Lots 56, 57 and 58, being property at the southwest corner of Lexington Avenue and 116th Street?

A. Yes, sir.

Q. And say how you reached your figures of $84,386.40 for that appraisal?

A. I face the property on 116th Street; for one inside lot I have allowed $20,000; for the lot adjoining——

Q. That is for an inside lot?

A. Yes, sir.

Q. $20,000?

A. Yes, sir.

Q. Yes.

A. For the lot adjoining on the corner I have allowed $22,000; for the corner lot, in which I have allowed the full 30 feet frontage, $42,386.40.

Q. Did you allow any plottage?

A. In all of these figures I have included plottage in my estimate. Had the land been sold separately there would be 10 per cent. deducted from the larger plots and 5 per cent from the smaller.

Q. Isn't it customary to take the valuations of lots sold by retail, so to speak, and add to that total some percentage in order to reach plottage?

A. Well, I don't know that that is a general rule, sir. I have done it one way and I have done it the other.

Q. Do you think it is possible to take the valuations of single lots and add to them a certain amount representing plottage and then aggregate a large number of lots on that basis and reach as accurate a result?

A. Yes, sir, I think so.

Q. Will you take the next plot, Block 1642, Lots 32 and 33, northwest corner of Third Avenue and 114th Street, and say how you reached that total of $74,104?

A. Northwest corner of Third Avenue and 114th Street, 2747 2,592 square feet, $12 a square foot, $31,104. Two lots on 114th Street at $14,000 each, $28,000. There is a mistake in that sum that I have given to you before, a mistake of my stenographer.

Q. Will you make the correction now?

A. Yes, sir; the total of that land value is $59,104.

By the Master:

Q. Instead of $74,000?

A. Yes, sir. I see my stenographer has added in

$15,000 there twice and the buildings add to the market value of the land $15,000 making a total of $74,104.

See correction p. 2726.

By Mr. MATHEWSON:

Q. That $74,104 includes the buildings?

A. Yes, sir.

By Mr. BURR:

Q. Will that change your total to that extent?

A. It will change the total $15,000, yes, sir.

Q. Less or more?

A. Less.

By Mr. MATHEWSON:

Q. Is your 2,592 square feet the area of the plot facing on Third Avenue running back 100 feet?

A. Yes, sir.

Q. And is that the basis upon which you think that the lot would sell if sold by itself?

A. Yes, sir. I should not have allowed for plottage on that plot.

Q. Isn't it a fact that where you have a plot of land like this facing on two streets running through from one street to another, or having a facing on an avenue and a street, that it is more valuable in the aggregate than it would be sold in lots. Isn't it a distinct advantage to have entrances on both an avenue and a street for a plot of that shape?

2748 A. I don't think so, no, sir; not in this special neighborhood.

Q. Don't you think an L shaped plot as a rule having an entrance on two streets or a street and an avenue has an added element of value from that very fact?

A. Yes, sir, on Broadway, Fifth Avenue and others, but not at Third Avenue and 114th Street.

Q. You think this is an exception to that rule?

A. No, sir. I think there are a great many other exceptions.

Q. That may be, but you think this is an exception?

A. I think that is an exception to the general rule, yes, sir.

Q. Are you familiar with the sales in the vicinity of Third Avenue and 114th Street?

A. Yes, sir.

Q. Have you ever made any in that section recently?

A. I have sold several in that neighborhood but as far back as 1898.

Q. That is the oldest, is it?

A. That is the oldest sale in there, yes, sir.

Q. Hasn't property largely increased in value in New York City in the real estate field in the past five or six years?

A. Very much, sir.

Q. Are you familiar with the property at the northeast corner of 114th Street and Third Avenue?

A. Yes, sir.

Q. Do you know what that sold for in 1900, in May, 1900? I refer to the plot 25 x 100, being the same size as this plot amounting to 2,592 square feet on Third Avenue, belonging to the Consolidated?

A. I have not the memorandum of that sale with me. I have it in my office; I haven't it here.

Q. Well, now, you have taken the value of the Consolidated Company's lots at the northwest corner of Third Avenue and 114th Street, facing 25 feet and a trifle over on the Avenue as $31,104?

A. Yes, sir.

2749 Q. Now, if it be true, that the lot on the northeast corner of 114th Street and Third Avenue, of the same or a little smaller size, sold in May, 1900, for $40,000, wouldn't that modify your view as to the value of a corner lot at that point?

A. Not until I had seen all the circumstances of the sale, the class of building and everything else on it.

Q. Not a very expensive class of buildings there, is there?

A. I do not know, sir; I do not recall the northeast corner.

Q. Is there any building on the northwest corner, occupied by the Consolidated Gas Company?

A. A three-story building there, yes, sir.

Q. You have not a memorandum either of the sale of 2091 Third Avenue?

A. No, sir.

Q. The corner of 114th Street, have you?

A. No, sir. I will make a memorandum of this and have that for you to-morrow.

Q. Will you take Block 870, plots 54, 56, 59 and 60, at the southeast corner of 15th Street and Irving Place, and give the details of your figuring resulting in $223,491.20?

A. Southeast corner of Irving Place and 15th Street, 2,637 square feet at $60,000 per lot or $24 per square foot, $63,288.00. The lot adjoining the corner, 2,637 square feet at $44,000 per lot or $17.60 per square foot, $46,411.20. 3,587 square feet, inside lots on Irving Place, at $40,000 per lot, or $16 per square foot, $57,392. Two lots each containing 4,200 square feet on East 15th Street, $17,500 per city lot, or $7 per square foot, $29,400. The buildings add to the market value of the land $27,000, divided as follows: Irving Place, $20,000; 124 East 15th Street, $6,000; 126 East 15th Street, $1,000.

By Mr. BURR:

Q. And what is the total?

A. The total is $223,491.20.

2750 By Mr. MATHEWSON:

Q. I see in this estimate Block 870, Lots 54, 56, 59 and 60, you have allowed for buildings only $27,000 to make up your total of $223,491.20?

A. Yes, sir.

Q. You have no idea that those buildings could be reproduced in their present condition for $27,000, have you?

A. I don't think that they can be.

Q. And aren't they, so far as you observed, employed by the Consolidated Gas Company for an office building and for its uses?

A. For the Consolidated Gas Company, yes, sir. I presume it is, as far as I can see.

Q. Why, then, don't you allow for the buildings the value of the buildings to the company as they are at present in use at their probable cost?

A. Because I am talking about as to what they add to the market value of the land and not giving the structural value of those buildings.

Q. You are assuming in other words that the land with these buildings on would be sold for some use other than the same use to which the buildings are now put?

A. I am assuming what it would sell for under ordinary circumstances.

Q. Under ordinary circumstances for the purpose of improvement in some different way?

A. That would depend on whether the man could use the buildings or not.

Q. If he could use the building, if it was useful to him just as it stood now, it would be worth more than $27,000?

A. It might possibly. It might be worth $27,000 to a man that would alter the building.

Q. You have used the expression from time to time that you have omitted buildings on the property because they would add nothing to the value of the land?

A. To the market value of the land.

2751 Q. To the market value of the land. Just what did you mean by that?

A. I mean what that land would sell for under ordinary circumstances.

Q. And it would be your view that if this land were sold with gas appliances on it that it would virtually, so far as structures go, bring the value of the land or a very little more?

A. That is my opinion, if sold in the open market.

Q. Under ordinary circumstances?

A. Under ordinary circumstances.

Q. Taking now your values on 15th Street, Block 870, what valuation do you say you placed on the street lots?

A. $17,500, that is, per city lot; they are not full city lots. The total value is $29,400.

Q. And what on Irving Place?

A. On Irving Place my unit of value is $40,000.

Q. Are you familiar with sales in that locality?

A. I am; yes, sir.

Q. Are you familiar with the sale of 131 East 15th Street?

A. I have only the Irving Place sales here.

Q. Where is 42 Irving Place located?

A. 42 and 44, 7 feet 9 inches south of 17th Street.

Q. Do you know what 42 and 44 sold for?

A. Yes, sir, for $90,000 on July 9, 1906.

Q. Two lots—not full city lots, are they. Is not 42 only 22 feet wide and 86 feet deep, and No. 44 26 feet wide and 86 feet deep for part of the distance and 116 feet for the balance?

A. No. 42 is 22 by 86 feet 4 inches; No. 44 is 26 by 86 feet four inches on the southerly line and 116 feet 1 inch on the northerly line.

Q. What would be an average depth, do you think?

A. About 101 feet—there is more average depth than that, sir; only a small portion of that which is not 116 feet deep; there is only 22 feet on the rear end which is not 116 feet deep.

2752 Q. You said your lots on 15th Street were — $17,500?

A. Yes, sir; $17,500.

Q. What is the width, 25 feet?

A. 25 feet, yes, sir; 25 by 100. Did you ask me about a sale on 15th Street?

Q. You placed the value of the 15th Street lots at $17,500 apiece?

A. Yes.

Q. Are you familiar with the sales of 126 East 16th Street or 128 East 16th Street. They are in the next street?

A. I have the sale of 128 East 16th Street in 1900.

Q. Have you it for 1906, when it was sold to the City, this defendant?

A. No, sir, I have not.

Q. Have you the record of the sales of 125 East 15th Street or 127 East 15th Street, this same street, made to the city in 1906?

A. No, sir; I have not any record of sales to the city.

Q. Or 129 East 15th Street or 131 East 15th Street?

A. Are all those to the city?

Q. Yes.

A. No, sir. I have no record of those.

Q. If it be true that 126 East 16th Street was sold in 1906 for $40,000 with an old building worth perhaps $5,000, and 128 East 16th Street was sold for $50,000 and 125 and 127 East 15th Street were sold for $72,500 and 129 East 15th Street was sold for $30,000, and 131 East 15th Street was sold for $48,000, within the current year, would not that modify your view that the lots on 15th Street of the Consolidated Gas Company, off Irving Place, were worth $17,500?

A. Not until I knew the value of the four-story buildings which were on there and also I would consider it value, because they were bought by the city of New Yo[illegible] who always pay more than a private purchaser, to save the expense [illegible] condemnation proceedings.

Q. You would not think the expenses of condemnation 2753 proceedings would be the difference between $17,500 and any such figures as I have stated?

A. I have added that there were 4-story buildings in addition to the expenses of condemnation proceedings. You have not spoken of the buildings at all, but have assumed that they were vacant lots.

Q. No, I am assuming the buildings of such general character as you know them to be in that section, and that you valued them on the same basis you valued the buildings of the Consolidated Gas Company at Irving Place and 14th Street.

A. Yes, sir, but I don't know that I would take them on the same basis that I valued the Consolidated Gas Company buildings. A 4-story dwelling on East 15th Street will bring in a good rental.

Q. Don't you think the buildings of the Consolidated Gas Company on 15th Street and Irving Place only one block from 14th Street and half a block from Third Avenue, would bring in a good rental?

A. Not those buildings. You cannot make a residence out of it, and cannot make a business building out of it unless you spend a good deal of money on it.

Q. Well, that would be a question to be determined.

A. I am speaking of it as a real estate man.

Q. Will you take the property at the corner of Hester and Elizabeth Streets, Block 239, Lots 1 and 5, and say how you arrived at your total of $167,500 for those?

A. Two lots on Hester Street at $25,000 each, $50,000; lot adjoining the corner $27,500; corner lot $50,000; two lots on Elizabeth Street at $20,000 each, $40,000, total $167,500.

Q. You say that there are no buildings there that add to the value of the land?

A. Yes, sir.

Q. What buildings are there?

A. On Hester Street is a 2½-story and basement gable roof brick
building apparently about fifty years old. In the rear is a
2754 3-story brick building which is used as a stable; also an old
building.

Q. Do you mean to say those buildings are worthless?

A. To the market value of the land, yes, sir. They are absolutely inadequate improvements.

Q. In other words, you proceed on the theory that if someone bought the land they would pay the value of the land and remove the buildings to put up something else?

A. I am going on that assumption, yes, sir.

Q. But so far as those buildings are concerned, they seem to be in use now?

A. They are in use now, yes, sir.

Q. And you have not taken into consideration there the cost or value to one who can use them as they are, in giving this estimate of the value of the land?

A. No, sir, I have only taken them as to what they add to the market value of the land.

Q. Are you familiar with sales in that vicinity?

A. Yes, sir, I have recently done quite a little appraising in that neighborhood and have had reason to look up the sales.

Q. Do you know what 174 Hester Street sold for in 1905?

A. Yes, sir. I cannot tell you offhand. I took that into consideration. I have appraised 174 Hester Street not less than five weeks ago.

Q. The buildings there are practically worthless, aren't they, old three-story buildings?

A. 174 Hester Street?

Q. Yes.

A. Five-story building, isn't it?

Q. I think not.

A. I appraised it about five weeks ago.

Q. I think that 174 Hester Street is an old three-story building.

A. 174, three-story and basement brick and frame building, with three-story tenement in the rear; front and rear tenements.

Q. Do you remember what that sold for?

2755 A. I don't recall right now. I knew it at the time I made up these figures.

Q. Take now the plot on East 15th Street, irregular in shape, being Block 972, Lot 45. How do you make up the $12,279.37 which you give as the value?

A. This building has a frontage of 13¼ feet on the street by 106.70 feet, containing 1,413.78 square feet, which I have valued at $9,000 a lot, or $3.60 a square foot, making a valuation of $5,089.61. To the west of it is an interior plot containing 7,988.62 square feet, which I have valued at 90 cents per square foot or one-fourth the value of the front land, or $7,189.76, or a total of $12,279.37.

Q. Did you use any scale in estimating the value of the interior land there, not fronting on the street?

A. I did not. This is the same rule I used when I appraised the property for the company two years ago, taking them on the theory that interior property is worth one-fourth the value of front land.

Q. Do you know what 25-foot lots are worth on East 15th Street in that neighborhood?

A. I put them at $9,000.

Q. Do you know of any lots in that neighborhood that sold for $9,000 within the last year, equally well located?

Mr. Burr: What do you mean by equally well located?

Mr. Mathewson: I mean so far as distance from 14th Street or from the corner goes.

A. I have no sales on East 15th Street in 1906 in that locality.

Q. Your estimate then in your own view and not based upon sales in that immediate locality?

A. Based upon my opinion, sir, of two years ago, with what I think it is worth to-day. I based it on sales two years ago that were made then.

2756 Q. Property is considerably more valuable than it was two years ago, is it not?

A. Not in that special place, no, sir.

Q. Is it not generally in the city? Has there not been a very substantial rise in the City of New York in the last two years?

A. Yes, sir, it has raised all the way from 10 to 100 per cent. in localities; in some it has raised more.

Mr. Burr: Were you speaking of the City of New York or the Borough of Manhattan?

The Witness: Borough of Manhattan.

Mr. Mathewson: I also referred to the Borough of Manhattan when I speak of the City of New York.

Q. Will you take now Block 985, the stations on 17th and 18th Streets, between Avenue B and Avenue C, and say how you obtained those values of $196,000?

A. There are twenty-eight lots there, $7,000 a city lot, making $196,000.

Q. You say you considered the buildings there as adding nothing to the value of the land. Will you define the buildings which you observed there?

A. Why, the property was almost entirely vacant.

Q. But you said there was a coal office, didn't you, and that there was coal sheds?

A. Yes, sir, I gave no value to that coal office and coal sheds. I don't think they added anything to the value of the land.

Q. So, I understand; they may not have, if you were selling it for improvements in some other direction, but the coal office and the sheds were of some value to the people who were using them, presumably, were they not?

A. I presume they were of some value, but I do not see how anybody could fix a value on that coal office.

2757 Q. Just what, you could not say?

A. Why, $50.

Q. Coal sheds cost money, too?

A. Coal sheds cost money, too. They are all frame sheds.

Q. You did not take into consideration the structures there that the company was using regardless of whether they cost much or little?

A. Not where the improvement was inadequate. There are buildings I have taken into consideration which the company was using.

Q. I understand, but you considered the structures there which the Company was using as inadequate and therefore included no value at all for those in your total value of the plot?

A. No, sir.

Q. Now I want to recall your attention for a moment to the previous plots regarding which you testified. That is the irregular plot which you gave an estimate of $12,279.37, being Block 972. Are you not aware that that plot is assessed for $20,000 for taxation as against your estimate of $12,279.37?

A. I have not the remotest idea what the assessment is, not the remotest.

Q. If it be true that it is assessed for $20,000, would that modify your estimate of the value of the parcel at all?

A. Not in the slightest.

Q. Are you aware that the Block marked 985 to which you have just testified and upon which you have placed a value of $196,000, all told, is assessed for $179,000 for land only?

A. What year is this?

Q. 1906?

A. I am not.

Q. That would not affect your estimate of value if you knew that to be the fact?

A. It would not, no sir.

Q. Take Block 982, being the property facing on Third Avenue bounded by 14th and 15th Streets. How do you get your total of $240,436.58 for that plot?

2758 A. Northwest corner of Avenue A and 14th Street 2814.38 square feet at $4.15	$11,679.57
Adjoining the corner of 14th Street 2813.29 square feet at $3.45 a square foot	9,705.85
Four inside lots 2813.29 square feet each, 11,253.16 square feet at $3.25	36,572.77
Adjoining the corner of 15th Street 2813.29 square feet at $3.40 a square foot	9,565.19
Southwest corner Avenue C and 15th Street 2814.38 square feet at $3.70	10,413.20
Thirteen inside lots on 14th Street, $6,900 each	89,700.00
Thirteen inside lots on 15th Street, at $5,600 each	72,800.00
	$240,436.58

Q. You know sales have taken place in 14th and 15th Streets as far east — within the last year or two, don't you?

A. 14th and 15th Streets?

Q. Yes. Take 15th Street, do you know or any sale that has taken place on the basis of $5,600 per lot for a lot on 15th Street in that neighborhood?

A. There does not seem to have been a sale on 15th Street with an expressed consideration in that time, sir.

Q. How about in 1905?

A. When in 1905? There were in 1903. It is not a very active neighborhood.

Q. Are you not aware that there was a lot sold on East 15th Street between Avenue B and Avenue C, 25 by 100 feet for $11,900 in May, 1905, with an old building worth perhaps $2,500?

A. What is the number?

Q. 606 East 15th Street.

A. I beg your pardon, I have the sale here.

Q. That is $11,900, isn't it?

A. Yes, sir, with a four-story brick tenement with store in front and one-story brick tenement on the rear.

2759 Q. Do you know how much that building was worth?

A. I do not, I would have to go and look at it. I know it has two tenements.

Q. It probably is not worth more than $2,500, is it?

A. I have no idea, Mr. Mathewson, unless I look at it.

Q. Do you allow any plottage at all in this large block?

A. Just in a general way.

Q. No special percentage?

A. I would think these lots would separately — for 10 per cent. less.

Q. What did you add after you had got the value of your individual lot, selling as individual lots, to the value of such individual lot, to get the value of that lot if it went into a large plot?

A. In the neighborhood of ten per cent.

Q. You have not been familiar with the sales of any such large plots as this at one time by a single owner, have you, in that vicinity?

A. No, sir; I have not.

Q. Now it appears, if my information is correct that this plot here that you have valued at $240,000 is assessed for taxation at $275,000 for land alone. If that be correct, would that modify your view as to the value there?

A. None whatever, sir.

Q. Now, let us take the next plot. Block 989, Lot 1, facing on Avenue C between 15th and 16th Streets. How do you obtain your figures of $131,527.75 for that plot?

A.—

Northeast corner of Avenue C and 15th Street, 2840.20 square feet at $3.50 per square foot......	$9,940.70
Adjoining the corner of 15th Street, 2839.10 square feet at $3.35 a square foot....................	9,510.98
4 inside lots, 2839.10 square feet each, 11,356.40 square feet at $3.25......................	36,908.30
2760 Adjoining the corner of 16th Street, 2839.10 square feet at $3.35 a square foot........	9,227.07
Southeast corner of Avenue C and 16th Street, 2840.20 square feet at $3.50 a square foot........	9,940.70
10 Street lots at $5,600.00 each.................	56,000.00
Total	$131,527.75

Q. Now, take Lot 26, Block 989, at the other end of the block?

A.—

Southwest corner of Avenue D and 16th Street, 2349.62 square feet at $3.25....................	$7,636.26
Adjoining the corner of 16th Street, 2348.71 square feet, $2.90 a square foot.....................	6,811.26
4 inside lots, 2348.71 square feet each, 9394.84 square feet at $2.75.............................	25,835.81
Adjoining the corner of 15th Street, 2348.71 square feet at $2.90..............................	6,811.26
Northwest corner of Avenue D and 15th Street, 2349.62 square feet at $3.25..................	7,636.26
8 Street lots at $5,600.00 each..................	44,800.00
Total	$99,530.85

Q. Are you able to point to the sale of any street lots in this neighborhood for $5,600.00 each in the last year?

A. I would have to take in all these sales and analyze them. If I found any of them I would have to separate between the land and the buildings. There were no vacant lots sold in there that I remember.

Q. Now, the total of these two lots in Block 989 you have testified equals $231,058.60 as your estimate?

A. Yes, sir.

2761 Q. Now, it appears that they are assessed for taxation at more than that, or $245,000. Does that modify your view as to their value?

A. It does not, sir.

Q. Now, take Block 991.

Mr. Burr: When you speak of it appearing that they are assessed a certain amount, are you referring to the exhibit which appears in this case as the assessment?

Mr. Mathewson: Yes, the exhibit was put in in this case and I think it covers the 1906 assessment

Mr. Burr: That I don't know.

Mr. Mathewson: Well, I am assuming so. It is barely possible that my assessment is of another year, but I am sure if it is, that it is not any higher than the present assessment. They have been rising instead of falling.

The Witness: Is that the smaller block, do you mean, Mr. Mathewson:

Q. Yes, the block bounded by the marginal street, Avenue D, 15th and 16th Streets. How do you get at that total of $115,683.27?

A.—

Northeast corner of Avenue D and 15th Street, 2,582 square feet, at $3.25	$8,391.50
Lot adjoining 15th Street, 2,581 square feet, at $2.85	7,355.85
Four inside lots, at 2,581 square feet each, 10,324 square feet, at $2.75	28,391.00
Adjoining 16th Street, running through to Tompkins Street, 4,555.40 square feet, at $2.85	12,982.89
Southeast corner of Avenue D and 16th Street, running through to Tompkins Street, 4,258.80 square feet, at $3.25	13,841.10
2762 Northwest corner of Tompkins Street and 15th Street, 3,766.50 square feet, at $2.75	10,357.87
Adjoining the corner, 3,466.40 square feet at $2.85	9,879.24
Four inside lots, 10,881.70 square feet, at $2.25	24,483.82
Or a total of	$115,683.27

Q. Now, I will ask you the same question as to that. If it be assessed at $115,000, just the figure you have given, would that modify your views as to the value?

A. No, sir, it would not.

Q. Take now the next block south of that, Block 991, Lots 1 to 47, bounded by Tompkins Street, Avenue D, 14th and 15th Streets and state how you reached your total of $167,536.92 for that?

A.—

Northeast corner of Avenue D and 14th Street, 2,582 square feet, at $3.70	$9,553.00
Adjoining the corner of 14th Street, 2,581 square feet, at $3.00	7,743.00
Four inside lots of 2,581 square feet each or 10,324 square feet, at $2.75	28,391.00
Adjoining the corner of 15th Street, 2,581 square feet, at $2.85	7,355.85
Southeast corner of Avenue D and 15th Street, 2,582 square feet, at $3.25	8,391.50
Four lots on 15th Street, at $5,000 per lot	20,000.00
Southwest corner of Tompkins Street and 15th Street, 2,178.20 square feet, at $2.75	5,990.05
Adjoining the corner of 15th Street, 2,475.70 square feet, at $2.40	5,941.68
Four inside lots on Tompkins Street, 14,596.50 square feet, at $2.25	26,092.12
Adjoining the corner of 14th Street, 3,322.50 square feet, at $2.50	8,306.25
2763 Northwest corner of Tompkins Street and 14th Street, 3,622.30 square feet, at $3.25	11,772.47
Five lots on 14th Street, at $5,600 per lot	28,000.00
Total	$167,536.92

Q. Now you put a valuation of $5,600 on the lots facing 16th Street, as I recollect it, did you not, in Block 989?

A. Yes, sir.

Q. Well, do you mean to say that the lots on 14th Street which you also placed at $5,600, as near the water as that, are no more valuable than the lots on 15th and 16th Streets?

A. As a matter of fact I think they are less valuable on account of being near the water, they are less valuable for tenement house purposes.

Q. Are not lots, generally speaking, more valuable on 14th Street than they are on 15th and 16th Streets?

A. Generally speaking, yes, sir. But this is factory property and not residential property.

Q. Well, take it either as factory or residential, is not that true, that on a broad street like 14th Street, lots are more valuable than they are on 15th or 16th Streets?

A. 14th Street for factory property would be more valuable than 15th Street, but 14th Street factory property would not be more valuable than 15th Street residential property.

Q. No, but this property is of exactly the same kind, all used by the Gas Company, is it not?

A. I am speaking of the market value and what it would sell for.

Q. For what purpose?

A. For what the neighborhood justifies, if the gas houses were not there.

Q. Can you tell whether it would go into residential or factory property?

A. From the present indications, from the trend of events 2764 over there, I would say it would go into tenement property, with the exception of the water front.

Q. Can you point out here any lots which sold in 14th Street for $5,600 within the last year or two?

A. There have been no sales of vacant lots there within the last year or two.

Q. The only way you could reach this conclusion would be by a general reasoning; you could not say anything further without analyzing the sales?

A. If it was improved property. I have sold property on the east side and negotiated, and I know what it is worth further west. It is easy enough to take the trend of values from block to block.

Q. Have you sold unimproved lots on 14th Street to the west of this?

A. I have on 15th Street, not on 14th Street.

Q. Now the total which you give is $167,535.72, and it appears that the property is assessed for $180,000 for taxation by this defendant, the City of New York. Does not that modify your views as to the value?

A. It does not. I would like to add in most of those assessments there, I think the City has assessed, allowing for the buildings also, and I am testifying to the value of the land alone.

Q. I am referring to the assessment by the City of New York of $180,000 for land only.

A. I am only saying in some of the other cases. It would not change my opinion any.

Q. In every case I have mentioned the assessed value I am giving the land only.

A. It would not change my opinion any.

By the MASTER:

Q. In your experience, Mr. Thompson, is it common in the City of New York for land to be assessed for the purpose of taxation for more than its market value?

2765 A. No, it is generally assessed less, but it is very irregular. I could take you to 44th Street, and show you where one assessor differs from another just from one side of the street to the other, where one man would be very much higher than the man across the street.

By Mr. MATHEWSON:

Q. But generally speaking the assessment for taxation is lower.

A. I cannot say it is. I am retained now in over 300 cases where the assessment is much larger than it should be.

Q. That may be, but is it not the general experience that land in New York City, in the Borough of Manhattan, is assessed at a lower rate than the actual value of the property?

A. As a general proposition, I would say yes, but there are a great many exceptions to the rule. It is very irregular. It depends entirely on who the assessor is.

By the **Master**:

Q. Well, the fact is, is it not, that until a few years ago the assessed valuation ran anywhere from 50 to 80 per cent. of the market value, and that since the Low administration, when steps were taken looking to have property assessed at its market value, it has been assessed at a somewhat higher rate than it was before?

A. The year 1903, I think—I am striving to prove inequality now—will prove about 70 per cent.; and these very properties, a number of them, I have always thought they were assessed too high, and in fact I was retained two years ago to testify by the Consolidated Gas Company in the majority of these cases, that they were assessed too high. In 1904, I think, the assessment will show about 82 per cent.

Mr. **Burr**: Well, it is not disputed, and I think it is al-
2766 ready proven in the case that these assessments are disputed by the company.

Mr. **Mathewson**: Well, if your *certiorari* shows it, it shows it. I am not familiar with the *certiorari* proceedings.

By Mr. **Mathewson**:

Q. Now take Block 988, being the entire block between 14th and 15th Streets, Avenues C and D, which you have estimated at $370,754.63, and give us the analysis of that valuation.

A.—

Northeast corner of Avenue C and 14th Street, 2607.83 square feet, at $4.15	$10,822.45
Adjoining the corner of 14th Street, 2606.81 square feet at $3.45	8,993.49
Four inside lots 2606.81 square feet each, 10427 square feet at $3.25	33,888.53
Adjoining the corner of 15th Street 2606.51 square feet at $3.35	8,732.81
Southeast corner of Avenue C and 15th Street, 2607 square feet at $3.50	9,124.50
Nineteen inside lots on 15th Street at $5600 each	105,400.00
Southwest corner of Avenue D and 15th Street, 2582 square feet at $3.25	8,391.50
Adjoining the corner of 15th Street, 2581 square feet at $2.90	7,484.90
Four inside lots 2581 square feet each 10324 square feet at $2.75	28,391.00
Adjoining the corner of 14th Street, 2581 square feet at $3.05	7,872.05
Northwest corner of Avenue D and 14th Street, 2582 square feet at $3.70	9,553.40
Nineteen inside lots on 14th Street at $6900 each	131,100.00
Total	$370,754.63

2767 Q. You have taken the same value for street lots, $5,600 that you did in the other cases?

A. Yes, sir.

Q. Do you allow any special valuation for plottage here by reason of the fact that the blocks east and west of this block 988 are owned by the same owner?

A. I certainly did not.

Q. Now, I would like to know the basis on which you make your estimate of value. Is it the amount at which the lots would sell for?

A. Yes, sir; the amount for which the lots would sell for.

Q. How, at forced sale or at ordinary auction or how?

A. I have stated, sir, under ordinary circumstances, in the open market, not at forced sale, and not at auction, but what a purchaser——

Q. You mean negotiated in the usual way?

A. When a seller is willing to sell and a purchaser is willing to buy, that is market value.

Q. That would be true in the case of an auction sale. I am asking whether you refer to auction sales or negotiations?

A. I refer mostly to negotiations. Auction sales do sometimes bring the full price, but not always.

Q. Have you taken into consideration in estimating the price you think would be obtained for those lots, the character of the neighborhood and the fact that the Gas Company's plant is there?

A. Yes, sir.

Q. Have you considered the lots as sold one by one, or small plots at a time, or taken them as sold in very large plots?

A. I don't think it would ever be sold in very large plots, no sir.

Q. As a matter of fact, does not the presence of the gas plant depreciate the value of the surrounding property?

A. I think it does.

2768 Q. Well, the value of surrounding property, or the fact that surrounding property is surrounding does not affect the value of this property for use as a gas plant at all, does it?

A. Why, no, sir, I don't know that it does.

Q. In other words, the effect of the presence of the gas plant is on the surrounding property, and the property which the gas company uses is just as valuable for its purposes as though the land around it were vacant?

A. I am free to admit, sir, that if the gas companies were all going to be moved away, the property would sell for a great deal more, probably.

Q. If this property was to be sold, are you proceeding on the assumption it is to be sold for another gas works or improved on ordinary lines?

A. I am taking what it would sell for to-day. If you made the announcement to-day that the Consolidated Gas Company was going to move everything away to-mor-ow——

Q. Of course if the property is sold, and is sold for some other purpose than the making of gas, immediately upon that announcement or as soon as that became known the value of this property in the market would rise?

A. If you moved them all away, yes, sir, but I am appraising that piece of property for instance with the gas company on the other side of the way. If you move them all away it is a different proposition.

Q. So the value of surrounding property which is depreciated by the presence of the gas works would not be any sure indication of the value of the Gas Company's property for the manufacture of gas so far as it is concerned, would it?

A. I have not taken that into consideration. I have only taken the values as I found them to-day. I don't know what value it would be for a manufacturing concern.

2769 Q. That is the point. Other property does not hurt us, but we do depreciate them and therefore it is utterly unfair to take the value of that surrounding property to get the value of our property?

A. Then we would go absolutely into the realm of speculation if we speculate on what we would do if they were not there. I can only take it as it is to-day.

Q. What percentage do you think would be added to the value of the property for the purpose of sale in ordinary negotiations if the Gas Company were to announce the removal of their gas works from this vicinity?

A. That assumption would be too much of a speculation for me. I couldn't guess at it. It would be too much for me.

Q. You think it would be very large?

A. Yes, sir, I think it would be a great deal; no doubt about that.

Q. Now, take the property on West 16th Street, Block 688, Lot 21, bounded by 16th and 17th Streets and Tenth Avenue and the new marginal street which you have valued at $322,187.20, and give me the analysis of that valuation?

A.—

Northeast corner of the marginal street and 16th Street, 2,275.75 square feet, at $8.40	$19,116.30
Adjoining lots, 2,517.25 square feet, at $6.00	15,103.50
Four inside lots, 9,176.16 square feet, at $5.00	45,880.80
Adjoining the corner of 17th Street, 2,945 square feet, at $6.00	17,670.00
Southeast corner of the marginal street and 17th Street, 3,186.50 square feet, at $8.40	26,766.60
Nine lots, 16th to 17th Streets, 2,300 square feet each, at $4.50	93,150.00
Two corner lots, Tenth Avenue, $17,500 per lot.	35,000.00
2770 Two lots adjoining the corners, at $13,750 each	27,500.00
Four inside lots, 2,400 square feet each, at $5.00 a square foot	42,000.00
Total	$322.187.20

Q. What does that make the value of those interior lots on 16th and 17th Streets computed 25 by one-half the depth of the block? You have given the valuation per square foot?

A. Yes, sir.

Q. Can you tell me what value that produces for a 25-foot lot half the depth of the block?

A. 2,500 square feet, $10,500.

Q. That is the least valuable of any of the lots you have figured out in this plot?

A. No, sir, there are nine lots on 16th and 17th Streets that I have appraised at $4.50 a foot.

Q. How much would that make per lot?

A. $10,350.

Q. Are you familiar with the sale at 418 to 420 West 16th Street, between Ninth and Tenth Avenues, in April, 1902, of an irregular vacant lot, 50x118 feet, over four and a half years ago?

A. In April, 1902, yes, sir.

Q. That sold for $35,000, didn't it?

A. I have no such record. It was sold for a nominal consideration.

Q. Well, don't you take pains to follow up and ascertain the actual consideration where it is possible, in keeping yourself familiar with sales and values in Manhattan?

A. When I can do so, I do.

Q. Well, aren't you aware that that sold actually for $35,000 or at the rate of about $17,000 per full lot, as against your estimate of $10,500?

A. I am not aware of it, but I have no reason to question it. There were two five-story brick tenements on it. I have no reason to question it at all.

2771 Q. No, this was irregular and vacant at that time?

A. What time?

Q. 1902, I think, April.

A. No, sir, there were two five-story tenements. I used it in my 19th and 20th dock proceedings, a sale very much used in favor of condemnation proceedings?

Mr. Burr: In whose favor?

The Witness: In favor of us the city, at that time, in establishing the value of the property.

Q. I will ask you to consider that subject further before to-morrow morning and see whether you are correct in considering that the land was improved.

A. I am quite positive it had a one to three-story brick tenement. Sale of the Hamilton Bank to the National Biscuit Company. I am pretty positive, I am very familiar with the sales in this neighborhood.

Q. Are you familiar with the sale of 445 West 16th Street between 9th and 10th Avenues which was sold, I think, in June last, 25 by 92 feet?

A. In June last?

Q. Yes.

A. I haven't any sale of it in June last. It must have been at a nominal consideration or I would have had it. I have no nominal considerations within the last year.

Q. It is suggested to me that that was sold for $13,250 with a two-story frame building of no value. If that sale be a fact, would that not affect your judgment as to the value of lots along there?

A. No, sir; not unless I knew the conditions surrounding the sale. It would not affect my judgment of the value, and their consideration would not.

Q. Take Block 689, Lot 17, bounded by 10th Avenue and the marginal street, 17th and 18th Streets, and analyze your value of $402,347.20.

2772 A.—

Northeast corner marginal street and 17th Street, 2,757.50 square feet at $8.40	$23,163.00
One lot adjoining the corner of 17th Street, 2,999 square feet at $6.00	17,994.00
Four inside lots, 9,744.84 square feet at *at* $5	48,720.00
One lot adjoining the corner of 18th Street, 2,801.50 square feet at $6	16,809.00
Southeast corner of marginal street and 18th Street, 3,043 square feet at $8.40	25,561.20
Sixteen street lots, 2,300 square feet each, at $4.50	165,600.00
Two corner lots on 10th Avenue, at $17,500 each	35,000.00
Two lots adjoining the corners at $13,750 each	27,500.00
Four inside lots, 2,100 square feet each, at $5	42,000.00
Total	$402,347.20

Q. Did you allow plottage there except in the manner that you have previously testified?

A. Only in a general way.

Q. Now, take the block next north, Block 690, bounded by 10th Avenue, marginal street, 18th and 19th Streets.

A.—

Southeast corner of marginal street, 2,018.59 square feet at $7.50 per square foot	$15,139.42
The lot adjoining on the east, 2,300 feet at $5.00	11,500.00
The next easterly lot, 2,300 square feet at $4.80	11,040.00
The next easterly lot, 2,300 square feet at $4.80	11,040.00
2773 Eight lots on 19th Street, 18,400 square feet at $4.40	80,960.00
Northeast corner marginal street and 18th Street, 2,614 square feet at $8.40	21,957.60
Adjoining lot, 2,855.50 at $6	17,132.00
Two lots adjoining, 5,340.50 at $5	26,702.50
11 lots on 18th Street at $4.50, 2,300 square feet each	113,850.00
Two corner lots on 10th Avenue, $17,500 per lot	35,000.00
Two lots adjoining corner at $13,750 each	27,500.00
4 inside lots, 2,100 square feet each, $12,500 per lot or $5 per square foot	42,000.00
Total	$413,822.52

Q. Analyze next your figure of $164,479.20 for Block 691, facing on marginal street, 19th and 20th Streets?

A.—

Northeast corner of marginal and 19th Streets, 2,470.75 square feet, at $8.40	$20,754.30
One lot adjoining corner, 2,712.25 square feet, at $6.00	16,273.50
Four inside lots, 9,831.36 square feet, at $5.00	49,156.80
One lot adjoining corner, 3,140 square feet, at $6.00	18,840.00
Southeast corner of marginal and 20th Streets, 3,381.50 square feet, at $8.40	28,404.60
Three street lots, 2,300 square feet each, at $4.50	31,050.00
Total	$164,479.20

Q. Did I understand you to say that you had been retained by the City and had testified for the City in connection with this improvement, which took a portion of these various blocks belonging
2774 to the Consolidated Gas Company?

A. I was retained by the City in the matter of 18th, 19th, 20th, 21st and 22d Streets in that proceeding. I was the third witness in the case and the other two witnesses were Mr. Kerwin and Mr. Smith; they testified; I was not called upon to testify, but I had prepared myself in the event of the death of one of them.

Q. When was this?

A. My original figures were made in 1902 and brought up to 1904, from time to time.

Q. Did you ever testify to those figures in a proceeding?

A. No, sir, I was not called upon to testify.

Q. Are the figures you have given here to-day, the 1904 figures?

A. No, sir, they are in excess of 1904 figures.

Q. You allowed for some increase in value?

A. Yes, sir.

Q. Due to the lapse of time or due to the fact that the marginal street now runs along this property?

A. Well, not only the marginal street but the ferries coming up there—I mean the railroads coming up there to 23d Street, like the Lackawanna, Erie, New Jersey Central—and improvements of that character have improved the neighborhood.

Q. That has added very substantially to the value of the property in that section?

A. I think so. Above there it has added more than it has below. I think it will do so. I have taken that into consideration.

Q. If you owned that property you would expect to sell it for considerably more on account of those improvements?

A. Exactly, sir, and I have allowed for those improvements in making my figures. I might add in all these cases I have arranged my figures as to what they would be worth after the City had taken its portion. For a marginal street I gave $21,000 for Eleventh Avenue. I would not have given more than $12,000. I am speaking of the corner.

2775 Q. Block 716, Lot 14, being a 75-foot lot on the north side of 18th Street, east of Tenth Avenue?

A. Three lots at $12,000, $36,000.

Q. Don't you allow anything for buildings there?

A. No, sir; those are old two-story buildings; they are very old.

Q. But aren't they used for any purpose?

A. I am not sure now whether the gas company uses them or not. At one time they did not, I know.

Q. Don't you know that the gas company is using them; didn't you observe that?

A. I am not positive about that. While I was there the other day I was there in an automobile and I just looked it over hurriedly, and I remembered it from when I had looked at it two years ago.

Q. You did not include any valuation for buildings in this $36,000?

A. Not for that building, no, sir.

Q. Nor for any building?

A. No, sir.

Q. Now take Block 715 on the south side of 18th Street opposite the last plot, 225 feet front on 18th Street?

A. Nine lots at $12,000 each, $108,000.

Q. Do you know of any sales of vacant lots in that section or immediately in that neighborhood at the prices you have fixed per lot, $12,000, recently.

A. I don't think there has been a sale in that neighborhood for five or six years, if anything.

Q. Now, take Lot 951, south side of East 20th Street, Lot 35, west of Avenue A, which you valued at $59,000, including building, and will you give us the details of that valuation?

A. Seven lots at $7,000 a Block, $49,000. Buildings add to the market value of the land, $10,000.

Q. What kind of buildings are they?

A. It is the Gas Company's a three-story brick stable.

Q. Covering the entire property?

A. No, sir; built from front and rear and on the east side, with an open court in the centre.

2776 Q. There are about seven lots there, aren't there?

A. Seven lots, yes, sir.

Q. And for the buildings on that you allowed $10,000?

A. Yes, sir, main building, and there was a building all the way around.

Q. That would leave for the land alone $49,000?

A. $49,000, yes, sir.

Q. Now it appears to be assessed at $50,000 or more than the appraisal of the land; does that affect your estimate of value at all?

A. No, sir.

Q. Take next block, 952, between 20th and 21st Streets, facing on the westerly side of Avenue A and which you have valued at $333,520. Please give us the details of that?

A.—

Two corners on Avenue A at $12,000 each	$24,000.00
Two lots adjoining corners at $10,000	20,000.00
Four inside lots at $9,000 each	36,0000.00
Thirty-two lots at $7,000 each	224,000.00

Then there are 34 feet more on the street, which I have valued at the rate of $7,000 a lot, which would be $9,520, a total of $313,520; to which I have added $20,000 as what the buildings add to the market value of the land, making a total of $333,520.

Q. Now, the land valued only which you valued at $313,520 appears to be assessed for taxation by the city at $340,000 for the land only, which is more than you allow both for the land and buildings which you estimated at $20,000. Does not that have some influence on your judgment as to the accuracy of your estimate?

A. None whatever.

At 4.40 p. m. adjourned to October 11, 1906, at 11 o'clock a. m.

Last exhibits:

Complainant's 256.
State's, W.

2777 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *October* 11*th*, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

2778 MR. BURR: The motion made before Judge Lacombe by the defendant, the City, was for an examination of the books of the company and for an inspection of its plant by a competent engineer. A similar motion was made by the State. This examination and this inspection were deemed absolutely necessary for the proper presentation of the defense of the defendant. We wished an equal chance with complainant to present our case to the Court. The complainant made up its case from its books, which were the sole source of information, and we wished an opportunity for a full examination of those books.

The complainant put witnesses on the stand to testify to the value of its plants. We desired an opportunity to inspect them by competent engineers so that they could testify to their value. The right to the inspection of the plants was conceded by the complainant, and the only remaining question to be determined by the Master under the ruling of Judge Lacombe is to what extent and in what manner shall we be permitted to examine the books and vouchers of the complainants to ascertain what is the true cost of the manufacture and distribution of its gas and what is the true structural value of its plant. We have our accountants ready to examine the books and our engineers ready to inspect the plants.

It will be necessary that the accountants, and we now ask the Master to direct that they be permitted:

1. To examine all documents and books relating to or upon which Exhibit 94 is based.

2. To examine all books and documents relating to or upon which is based the cost of gas for some particular year between the years 1900 and 1905.

2779 3. That the accountants shall be permitted to examine all books and documents relating to or upon which the actual structural cost is based in 1884, or subsequent thereto, and also all of the books of the six companies which in 1884 joined together as the Consolidated Gas Company.

For these purposes will be required the following books:

For the Actual Cash Cost of Gas.

The operating ledger for 1905 and all subsidiary books and documents from which its entries are made.

Also the operating ledger and all subsidiary books and documents for a selected year subsequent to 1900, from which its entries are drawn.

For the Actual Structural Cost of the Gas Works.

The general ledger or ledgers since 1884 and all subsidiary books or documents from which its entries are drawn.

If necessary, the investigation of these general ledgers and subsidiary books and documents can be confined to the following principal accounts, together with their subsidiary repairs and new construction accounts, and all books, vouchers and documents from which their entries are drawn:

1. Real Estate.
2. Manufacturing and Distributing Plant.
3. Gas Holders.
4. Mains.
5. Service Pipes.
6. Meters.
7. Miscellaneous Apparatus.

2780 Now I understood at our conference yesterday that I was to make this request upon the record and Mr. Garver, representing the complainant, was to state to what part of that request he would accede, and then that we would ask a ruling by the Master upon those parts which were refused.

Mr. **Mathewson**: Does this include the requests for Attorney-General Mayer and the Gas Commission-s and the other defendants other than the City?

Mr. **Kirby**: We make such a request.

The **Master**: Do I understand that you unite in the request made by Mr. Burr and that it is identical in all respects; in other words, that you want the same books and for the same years and to the same extent that are specified in Mr. Burr's motion?

Mr. **Kirby**: We do so unite. We do not feel the present great necessity for the examination of all the documents which Mr. Burr suggests, but we do consider that such an examination will be necessary before a determination of this hearing, so that we join in *at* the request at this time. The State, specifically, at this time, desires permission to examine all books and documents of any kind going to make up the statements set forth in any of the exhibits of the complainants and especially in reference to Exhibit 94 and the exhibit relating to repairs and renewals from 1884 to the present.

The **Master**: Do you want to have anything about this on the record now, Mr. Mathewson, or do you prefer to wait until it is written out?

Mr. **Mathewson**: I prefer to wait until this is written out so I can see what is really requested. I will merely say now that the right of defendants to an inspection of complainant's plants is not conceded and has not been conceded. We have given the right to such an inspection, but I do not wish it to appear that we concede that as a matter of right, because we do not. As to the requests before the Master, I would like to see them in form and then present any considerations to the Master before they are formally passed upon. 2781

Mr. **Burr**: May I suggest that the time is limited and if the stenographer could have that written out by the time we come back at recess, so we could have a ruling upon it this afternoon, it would expedite the matter, as the time is extremely limited and our people are ready to proceed with the examination.

The **Master**: Then after Mr. Mathewson has indicated to what extent this can be arranged by stipulation, I will take up the matters that still remain in issue and dispose of them.

Mr. **Kirby**: I take it that even now there is no objection to our going ahead with an examination of those items going to make up the statement Exhibit 94.

The **Master**: I have so understood.

Mr. **Kirby**.: And that being so, we can start in this morning, as I take it, in that part of the examination. Mr. Mathewson is in accord with that, is he not?

Mr. **Mathewson**: No objection to that except that I would have to instruct the company's subordinates on the subject.

Mr. **Kirby**: Then is it your desire that we should not start in this morning?

Mr. **Mathewson**: I think I can arrange by telephone that you can start in on that.

2782 JOHN M. THOMPSON resumed.

Cross-examination by Mr. MATHEWSON (continued):

The WITNESS: On page 2745, the 12th line from the bottom, strike out "no appraisements," and insert "but have had appraisements."

Page 2747, the 8th line from the bottom, change the word "should" to "should not."

Page 2748, 15th line from the bottom, change "not much" to "very much."

Page 2752, 21st line from the bottom, change "my sales" to "any sales."

Page 2753, 13th line from the top, change "building" to "dwelling."

Q. Returning for a moment to page 3 of Exhibit 48, and taking Block 715, Lots 51 to 59, you refer to buildings thereon which you did not value, as you considered them to add nothing to the value of the land?

A. Yes, sir.

Q. What were those buildings?

A. There was just one two-story building there.

Q. What was it used for?

A. At one time it was used for gas purposes. As I told you yesterday, I am not sure whether it is being used now or not.

Q. Do you know for what gas purposes?

A. I do not. Shops, I think.

Q. Now, it is testified by other witnesses that that building was formerly used as a cover for holders or tanks. Did not you make sufficient examination of it so that you ascertained its use?

A. No, sir; I looked at it exteriorly and was satisfied by the exterior appearance that it could not be used for other purposes than gas purposes, and it was not necessary to ascertain its actual use.

Q. Where did you get the idea it was used for shops?

A. That is my recollection of what I gained from my examination in 1904.

2783 Q. Will you now take Block 953, being the entire block between 21st and 22d Streets, First Avenue and Avenue A, and state how you made up your valuation of $403,000?

A.—

2 corners on Avenue A at $12,000 ea.	$24,000.00
2 lots adjoining corners at $10,000 ea.	20,000.00
4 inside lots at $9,000 each.	36,000.00
2 corners on First Ave. at $15,000 ea.	30,000.00
2 lots adjoining corners at $11,000 ea.	22,000.00
4 inside lots at $10,000 ea.	40,000.00
33 street lots at $7,000 each	231,000.00
Total	$403,000.00

Q. Do you know of any unoccupied lots in that section that were sold for $7,000 within the last year?

A. No, sir; as I have stated, there have been very few sales of vacant lots in that neighborhood for some years.

Q. Are you not aware that No. 437 East 18th Street, lot 25 by 92 feet, sold as long ago as 1902 at $9,000, with only sheds on it, as against your present valuation of $7,000 for a street lot four years later?

A. That building was sold, sir, on April 30th, 1902, with a two-story brick front and rear building by M. Duffy, Trustee, to the American Carbonate Company, who are now using the building.

Q. 437 East 18th Street?

A. 437 East 18th Street.

Q. And is that the character of building that was on there in May, 1902?

A. Yes, sir; April or May, whatever time it was.

Q. Do you remember the building yourself?

A. Not in 1902, but I remember it when I appraised it for the gas company, and this was one of the sales I used.

2784 Q. I am talking about the condition in 1902. Is it not a fact that there were nothing but sheds there in 1902?

A. No, sir, it is not a fact.

Q. Where do you get your information?

A. From the *Real Estate Record and Guide,* a transfer taken from the *Real Estate Record and Guide,* which gives every character of improvement.

Q. At that time?

A. At that time. The record reads, being a transcript from the *Record and Guide:* "North side, 115 feet west of Avenue A, 25 by 92, two-story brick front and rear building, M. Duffy, Trustee, to the American Carbonate Company, April 30th, 1902, $9,000."

Q. Has property increased in that neighborhood in value in the last five or six years?

A. I think it has, yes, sir.

Q. Are you not aware that lots 515 to 521 East 17th Street sold at the rate of $7,000 six years ago, in 1900?

A. Will you give me the date in 1900?

Q. November, 1900, I think.

A. Yes, sir, four lots sold there in November, 1900, for $30,000, $7,500 each.

Q. And if there has been an increase in value in that section, they ought to be worth more now, ought they not?

A. More than $7,500?

Q. Yes.

A. No, I do not know the circumstances under which that sale was made for $7,500. And one sale does not——

Q. But generally speaking, you say that land in this vicinity has increased in value?

A. Yes, sir.

Q. And your present estimate is $7,000 per city lot?

A. Yes, sir.

Q. Let me call your attention to the further fact——

A. This is one sale.

Q. Certainly. That this entire block 953 which you estimate at $403,000 is assessed for taxation at $500,000 by the city. Does not that modify your judgment as to value?

A. None whatever, sir.

2785 Q. Take next, if you please, the block bounded by Avenue A, 21st Street, 22d Street and the marginal street, being Block 979, and state how you reach your valuation of $338,086 for that.

A.—

2 corners on Avenue A, $4.60 a sq. ft.	$23,000.00
2 lots adjoining the corner, $3.50 sq. ft.	17,500.00
4 inside lots on Avenue A, $3.40 sq. ft.	34,000.00
42 street lots at $5,600 each	235,200.00
2 gores on corners of marginal street, 7,885 sq. ft., at $3.60	28,386.00
Total	$338,086.00

Q. Now this entire block which you estimate at $338,086.00 appears to be assessed for taxation by the city, land only, at $351,500.00 or considerably more than your estimate of the full value. Does that affect your judgment as to the value at all?

A. None whatever, sir.

Q. Take next the block bounded by Avenue A, 21st Street, 20th Street and Avenue B, being Block 978, and state your analysis of the total of $338,518.60, which is your estimate.

A.—

Northeast corner of Avenue A, 2,500 sq. ft., at $4.60	$11,500.00
Lot adjoining the corner, 2,500 sq. ft., at $3.50	8,750.00
1 inside lot, 1,900 sq. ft., at $3.40	6,460.00
529 sq. ft. in the rear at $3.40	1,798.60
2 inside lots, 2,100 sq. —, each, being 4,200 sq. ft., at $3.40	14,280.00
Lot adjoining the corner of 21st Street, 2,500 sq ft., at $3.50	8,750.00
Southeast corner of Avenue A and 21st Street	11,500.00
2 corners on Avenue B at $10,000 each	20,000.00
2786 2 lots adjoining the corners at $7,500 each	15,000.00
4 inside lots, 8,400 sq. ft., at $2.40	20,160.00
37 1-5 lots at $5,600 each	208,320.00
Total	$326,518.60
No. 326 Avenue A, corner 21st Street, 4-story tenement, store on the first floor	$4,000.00
Nos. 328-330 Avenue A, 5-story tenement, 2 families to a floor, $4,000 each	8,000.00
Making a grand total of	$338,518.60

Q. In other words, you have added $12,000 to your land value for the buildings that are not used in the manufacture of gas?

A. Yes, sir.

Q. Do you suppose those buildings could be reproduced for $12,000?

A. No, sir.

Q. You have not taken, then, in any of your estimates where you have included a building value, either the original cost of construction of the building or the value of the building to the users as it is now used, but only the value of the buildings which you think would add to the selling value of the land?

A. No, sir, I have taken its rental value, just what it would add to the value of the land, taken on a rental basis.

Q. But not on the original cost of construction?

A. No, sir.

Q. Nor the value which it may be to the users for the particular use to which it is put?

A. No, sir. I might add that the gas company rents some of these buildings.

Q. That is all on the record. That is understood. What
2787 did you say you considered lots on the interior were worth for
this particular Block 978?

A. $5,600 each.

Q. Why do you put down $5,600 there as against $7,000 for the blocks westerly between Avenue A and First Avenue?

A. Because this is strictly a gas house district; there are four blocks occupied by the Consolidated Gas Company.

Q. But is not the Block 953 also occupied by the Consolidated Gas Company?

A. That block is farther west, one block farther west; a very much better block.

Q. So that if this property were to be sold here and not used as a gas manufacturing plant, and it were understood that it was to be sold for the purpose of general improvement, it would bring more than $5,600 a lot, wouldn't it?

A. I stated yesterday that I thought it would.

Q. Let me call your attention to the fact that the land in Block 978 which you value at $326,518.60, is actually assessed for taxation at $369,000, as appears in evidence. Doesn't that modify your view?

A. No, sir.

Q. Will you now analyze Block No. 987 which you have estimated at $83,873.96?

A.—

Northeast corner of Avenue B and 20th Street........	$10,000.00
Adjoining the corner of 20th Street...............	7,500.00
4 inside lots, 9,140 sq. ft., at $2.40 sq. ft.............	21,936.00
1 lot adjoining the corner 21st Street, 2,899.25 sq. ft., at $3.00..................................	8,697.75
Southeast corner of Avenue B and 21st Street, 2,375.50 sq. ft., at $4.00..........................	9,502.00
Gore on corner of marginal and 20th Streets, 4,699.44 sq. ft., at $3.20 sq. ft.......................	15,038.21
2 lots on 20th Street, at $5,600 each...............	11,200.00
Total	$83,873.96

2788 Q. Now I call your attention to the fact that this property which you have estimated at $83,873.96 is assessed land only, at $86,000. Again does that effect your view?

A. It does not, sir.

Q. Let me call your attention to the fact that every one of the six parcels on page 4 of Exhibit 48, that is to say, Blocks 951, 952, 953, 979, 978, and 987, are each and every one assessed for taxation, land value alone, at a higher figure than you have given for the value of the land. Does not that circumstance, taking all the blocks together, lead you to think you under-valued property in that section in this estimate?

A. It does not, sir. In fact, I know I have not under-valued it.

Q. Well, that is a matter of opinion. I wouldn't say I knew, because we are mistaken on matters of opinion. What you mean to say is you think you have not under-valued it, don't you?

A. And in the opinion of a great many others besides myself.

Q. That may be, but they are not on the stand now, however. Isn't it true that in taking four or six blocks contiguous as these are there is a considerable value added by reason of the fact that they are contiguous and in the hands of a single owner for the uses of that owner?

A. No, sir, I have allowed nothing for that.

Q. You haven't any idea that if the gas company were to endeavor to procure plots of equal size on the river, contiguous, at or about this point, they could be procured for the figures which you estimated as the present value of the land there, have you?

A. Why, I could only answer that by saying there are no such blocks in the City of New York. They could not get a vacant block; they would have to buy the buildings in a number of instances.

Q. Yes, upon the land values only.

A. Not if the buildings added to the value of the land, sir. They would have to pay for them.

2789 Q. You do not think, do you, that the land alone in this section could be acquired at the figures that you have placed as the land values for this company for its uses as a gas property, excluding values of buildings?

A. Again, sir, that is too much in the realm of speculation. There is no such block to-day to be purchased there. It is a question whether the Consolidated Gas Company would be next to it or not. It is impossible for me to answer that.

Q. Assuming this was not used now for gas purposes, but was used for the purpose of general improvements and tenements, whatever you find surrounding there, do you then think that the property, if it were so used and found so in use, could be acquired for the figures that you have placed on it here?

A. I do not.

Q. Will you now take Block 1090, page 5 of Exhibit 48, and state how you arrived at the total of $72,000 for that block?

A. Six lots at $12,000 a lot, $72,000.

Q. What buildings are there on Block 1090 which you say add nothing to the value of the land?

A. There are one-story and two-story brick buildings, used, I think, as offices.

Q. Why don't they add anything to the value of the land?

A. Because they are absolutely inadequate improvements.

Q. Except for the use of the Consolidated Gas Company, I suppose?

A. I suppose they find it adequate, sir. It is not adequate to the land.

Q. Not adequate to some other kind of improvement to the land, is it?

A. No, sir. My definition would be it is not an adequate improvement for the land.

2790 Q. Wouldn't it depend entirely upon what the land was used for? If you have a plot of land used for coal storage, and you have to have that covered by sheds, and it is so covered, it is adequately improved, so far as that use of the land is concerned, is it not?

A. In this case I do not consider it adequately improved for anybody. There are 150 feet, and on that there are a couple of little two-story buildings, and the value of the land is as much as $72,000.

Q. Do you know what the buildings are used for?

A. One is a stable, and the other is an office, a coal office, I think, according to my recollection. I have not gone carefully into these buildings. When I decided that they were inadequate I did not go into the absolute use of each one, but I think this was a coal office.

Q. Now, make the same analysis as to Block No. 1071, which you appraised at $52,000?

A. Four lots on 42d Street, at $13,000 a lot, $52,000.00.

Q. Why do you make a difference of $2,000 a lot between Block 1090 and 1071?

A. One is between Eleventh Avenue and Twelfth Avenue, the cheaper property; and the more expensive property is between Tenth and Eleventh Avenues. The difference is in the blocks.

Q. Isn't that wholly due to the fact that 1090 is nearer the gas plant?

A. No, sir, it is not.

Q. Isn't property nearer the river worth more than it is between Eleventh and Tenth Avenues?

A. No, sir, it is not.

Q. Is that a result of actual transactions there, or your estimate?

A. Actual transactions, yes, sir, and negotiations, appraisements, and a study of the situations.

Q. Will you take now Block 1070?

A. I might add that the gas company across the street does not help it any.

2791 Q. No, I suppose not; but you don't think that it hurts the gas company's property for the use of a gas company?

A. No, sir. Eight lots at $10,000 each, $80,000.

Q. Why $10,000 for those as against $12,000 for Block 1090 and $13,000 for Block 1071?

A. Because one is on 41st Street and the other is on 42d Street.

Q. Isn't the fact that Block 1090 is comparatively near a ferry at 42d Street a point in its favor, when you come to valuation?

A. Are you comparing 1070 and 1090 now, sir?

Q. 1071 and 1090?

A. It is a point in its favor, yes, sir.

Q. If it is nearer than Block 1071 substantially, wouldn't that indicate it was of as great a value in 1090 as in 1071?

A. No, sir, I don't think so, sir. I think the Tenth and Eleventh Avenue block is a better block.

Q. We will now take Block 1089, bounded by 41st and 42d Streets, Eleventh Avenue and the river. You first make an estimate of value of $599,500, if the city owns Twelfth Avenue; $779,500 if the company owns it and considers it as upland; and $699,500 if the company owns the avenue and it is considered as under water. Now, as a matter of fact, isn't practically the entire plot filled in up to the bulkhead line?

A. Yes, sir. I have so ascertained this morning.

Q. So it would be more proper to consider that as upland than land under water, would it not, in considering it?

A. I would like to state that I have discovered, furthermore, that the gas company does not own Twelfth Avenue and never did own it. The grant does not call for it.

Q. That, again, is a conclusion. You are simply, as an
2792 expert, making statements upon a hypothetical situation. I
do not think your testimony is very competent on that point?

Mr. Burr: Do you claim the company does own Twelfth Avenue?

Q. Didn't you find the company in possession of the property?

A. Yes, sir.

Q. And using it?

A. Yes, sir.

Q. Fenced in?

A. Yes, sir, but the grant does not give it to them.

Q. Do you know how many years they have used it?

A. A good many years.

Q. Do you know whether they have used it long enough to own it by adverse possession if they had not any deed at all?

A. I believe the case is on appeal now.

Q. Well, you don't want to decide the case in advance, do you?

Mr. Burr: Will you answer the question as to whether they own it?

Mr. Mathewson: Yes, it is certainly claimed the company owns Twelfth Avenue.

Mr. Burr: And that is the only claim the company has to it, adverse possession?

Mr. Mathewson: No, I do not say that at all, Mr. Burr.

Q. Now, you gave your dimensions, when you gave your valuation, as 801 feet or 800 feet on 41st and 42nd Streets. That takes you only to the westerly line of the projected Twelfth Avenue, does it?

A. Yes, sir, that is correct.

Q. And between that and the bulkhead line there were 250 feet?

A. That's right; 1,050 feet taken.

Q. Did you make an estimate of the entire 1,050 feet?

A. Yes, sir.

2793 Q. You did not in the $599,500.00 estimate, of course?

A. No, sir, but I did it in the next case where I assumed them to be owned by the gas company.

Q. Well, now, I will repeat my question: However it is to be considered, having been virtually filled in, all of it, up to the bulkhead line, it would be considered as upland rather than as land under water?

A. Yes, sir. It is not land under water.

Q. And you say you have not made any estimate at present of the value of that pier or of the privileges in connection with the bulkhead or the pier?

A. No, sir, I have not been able to get the information necessary. I am trying to get it to-day.

Q. Has not property in this neighborhood increased quite largely in the last few years in value?

A. I think there has been an increase over there, yes, sir.

Q. You haven't given the analysis yet, have you?

A. No, sir.

Q. Will you give me your analysis of this large Block 1089, leaving out the estimate of the value of the property within the line of projected Twelfth Avenue as under water, in view of the fact that it is found to be upland?

A. Northwest corner 41st Street and Eleventh Avenue, 2,469 square feet, $15,000; lot adjoining corner, $11,000; four inside lots, at $10,000 each, $40,000.

Q. That is on the value?

A. That is on Eleventh Avenue, yes, sir.

Lot adjoining corner 42d Street	$12,000.00
Southwest corner of 42d Street and Eleventh Avenue	17,500.00
28 lots on 42d Street, $11,000 each	308,000.00
28 lots on 41st Street, at $7,000 each	196,000.00
Total	$599,500.00

2794 If the City owns Twelfth Avenue. If the gas company owns Twelfth Avenue, add to this 10 lots at $11,000 each, $110,000, and 10 lots each at $7,000, or $70,000, or a total of $180,000, and a grand total of $779,500.

Q. Now, you have not added anything to your valuation by reason of the fact that the company owns the bulkhead rights, also owns the land adjoining, have you?

A. I have taken that into consideration, yes, sir.

Q. Have you taken into consideration plottage, except in the manner which you previously testified?

A. In no other way, sir.

Q. Are you familiar with the sale of 537 and 539 West 40th Street, in November, 1901?

A. I am familiar with it. No, sir, I have not the sale in 1901.

Q. Have you a record of the sale of 550 West 40th Street in 1901?

A. I have No. 537 in 1900, sir, and I have 537 in 1901, but not 537 and 539 in 1901.

Q. What was the improvement on that property, No. 537, according to your information?

A. In 1901 there was a one-story frame building, sheds, etc., and coal yards; that was 40th Street, however, wasn't it?

Q. Yes, sir.

A. A different street, too.

Q. 40th Street.

A. Yes, sir.

Q. What value did you put on the side lots facing on 41st Street in Block 1089?

A. $7,000, facing the stock yards.

Q. Have you the selling price of No. 537 in 1901, of the one-story shed to which you referred?

A. Not in 1901. I only have that in 1900.

Q. What was the selling price then?

A. I have just stated, $8,000.

Q. You say the property has increased in that neighborhood in value since?

A. Yes, sir.

Q. You have only given a value of $10,000 here?

A. Yes.

2795 Q. This latter for Eleventh Avenue lots?

A. Yes, sir, that is right, sir; 40th Street and Eleventh Avenue are not comparable.

Q. 40th Street and Eleventh Avenue?

A. Lots on 40th Street and lots on 11th Avenue are not to be compared.

Q. No, I suppose not, but you have figured your inside lots on 41st Street at how much again?

A. On 41st Street at that point $7,000, but it is very different from 40th Street in the other block. These lots on 41st Street face the stockyards.

Q. Does not the fact that a lot six years ago sold on 40th Street for $8,000, and there has been a general increase since, modify your estimate that the lots on 41st Street are now worth only $7,000?

A. No, sir, for at this point on 41st Street six years ago lots would not have sold at $7,000 or anything like it; they are lots right opposite the stockyards. They would have brought nearer $5,000.

Q. Now take page 6 of Exhibit 48 and give me the analysis of your values of $426,500 for Block 1092 if the City owns Eleventh Avenue, and $581,500 if the company owns it.

A.—

28 lots on 44th Street, at $8,000 each	$224,000.00
27 lots on 45th Street, $7,500 each	202,500.00
Total	$426,500.00

$4,500 added for the buildings making $431,000. If the gas company owns Twelfth Avenue, to this should be added

10 lots on 44th Street, at $8,000 each	$80,000.00
10 lots on 45th Street, at $7,500 each	75,000.00

a total of $155,000, or $581,500, to which is added the $4,500 for the buildings, making $586,000.

Q. If the company owns Twelfth Avenue, do you think
2796 that all those lots right up to the bulkhead line should be
considered as interior lots and valued in that way?

A. Yes, I have taken this and given what I thought was a fair average value there together.

Q. Considering the distance of 44th Street from the principal crosstown street, 42d Street, to be two blocks, and 41st Street to be only one block, don't you think that there is a disparity when you give an interior lot on 41st Street, as you did in reference to the previous plot, at $7,000, and an interior lot on 44th Street as more valuable, to wit, $8,000?

A. No, sir, because, as I have stated before, on 41st Street there is a great nuisance there in the way of stock yards; an exceedingly great nuisance, which would render those lots less valuable.

Q. Is that all it does, render them less valuable?

A. In my opinion, yes, sir.

Q. Assuming the neighborhood to be the same, lots on 41st Street——

A. The neighborhood cannot be the same with stock yards there.

Q. I say, assuming the neighborhood to be the same, under similar conditions you would say that lots on 41st Street would be more valuable than lots on 44th or 45th Street, wouldn't you?

A. I think they would, yes, sir, in the absence of the stock yards.

Q. Now take Block 1093, and give your analysis of the figures $332,500 if the city owns Twelfth Avenue and $487,500 if the company does?

A.—

23 lots on 45th Street at $7,500 each	$172,500
20 lots on 46th Street at $8,000 each	160,000
Total	$332,500

If the company owns Twelfth Avenue, to this should be
2797 added on 45th Street, ten lots at $7,500 each, or $75,000;
on 46th Street, ten lots at $8,000 each, $80,000; total, $155,000; or a grand total of $487,500.00.

Q. Why do you take $8,000 as a valuation of lots on 46th Street and $7,500 as the value of interior lots on 45th Street?

A. Because the character of improvement on 46th Street is better than those on 45th Street—on the north side of 46th Street.

Q. In other words, it is because 45th Street cuts the company's gas property, while 46th Street has only one side occupied by the gas works, which makes the difference?

A. Well, the easterly end of the block on 46th Street does not belong to the gas company and is improved.

Q. Is not the same true between 44th and 45th Streets?

A. Yes, sir, but there are a little better improvements at 46th

Street on the south side and very much better improvements on the north side.

Q. If the whole property were to be disposed of and not used thereafter as a gas plant, then the blocks on 45th Street would be just as valuable as on 46th Street, wouldn't they?

A. They probably would be, yes, sir.

Q. Now I ask you again, do you think it is fair to estimate to take interior lots, the lots on the bulkhead line, as considerably more valuable than interior lots as a rule?

A. I have taken that into consideration. They are more valuable, but I have taken that into consideration and given a general average value.

Q. But you took the same general average that you take for the assumption that the company did not own Twelfth Avenue, haven't you?

A. For the value of those lots, yes, sir. In that respect I have given the benefit to the company.

Q. I do not quite see that you have, but perhaps so. Now
2798 take page 7 of Exhibit 48, Block 1457, lot 6, which you valued at $154,000, I think it is, and give me your analysis of that figure.

A.—

19¼ lots, at $8,000	$154,000.00

Q. Will you likewise give me the analysis of your figures for $194,000 on Block 1455, Lot 13?

A. —

2 avenue corners, at $15,000	$30,000.00
2 lots adjoining corner, at $11,000	22,000.00
4 inside lots, at $10,000 each	40,000.00
17 street lots, at $6,000 each	102,000.00

Q. Referring to your valuation of lots on Block 1457 and 1455 at $8,000 and $6,000 for street lots, are you familiar with the sale of 417 East 59th Street in 1902?

A. Yes, sir.

Q. What did that sell for?

A. Lot 25 by 100 feet 4 inches, a four-story brick tenement, sold for $20,000, on East 59th Street.

Q. Do you know what No. 1108 First Avenue, between 60th and 61st Streets, 25 by 100 feet, sold for last year?

A. I probably do, as I testified in the Blackwell's Island case there. I think I bought that for the City. Did you say First Avenue or Avenue A?

Q. First Avenue.

A. Oh, I beg your pardon, then I was mistaken. Is it 1108?

Q. Yes.

A. No, sir, it must have been a nominal consideration, as I haven't it.

Q. Well, your values on the acquisition of the approach to Blackwell's Island Bridge were considerably higher than those you have testified to here.

A. I have not heard the awards. I don't know whether the Commissioners have made them or not.

Q. They purchased some of it, didn't they, without condemnation?

A. Yes, sir.

Q. And isn't it your information that they paid considerably higher figures than testified to here as the value of this property?

A. Not in proportion, no, sir. For a single lot at 59th
2799 Street and Avenue A, of course, the prices were larger, but, of course, the property was different.

Q. In proportion?

A. No, sir.

Q. In your judgment not?

A. Positively not. Not in my judgment, but founded on fact.

Q. Well, that would depend again upon your estimate of the relative values of the properties, which would be an opinion of yours, wouldn't it?

A. The city purchased on my estimate there.

Q. Let us take Block 1474, Lot 24, at the northeast corner of 60th Street and Avenue A.

A. Yes, sir.

Q. How did you reach the figures given there?

A. 5,230 square feet, as $12,500 per lot, or $5 per square foot, $26,150.

Q. Now turn to page 8, of Exhibit 48, and take Block 1177, bounded by West End Avenue, the railroad, 65th and 66th Streets, and give us the analysis of your estimate of $172,719.60.

A.—

2 corners on West End Avenue, 2,542 square feet each, or 5,084 square feet, at $5.60....................	$27,962.00
2 adjoining lots at $10,000 each..................	20,000.00
4 inside lots at $9,000 each......................	36,000.00
15 inside lots at $5,000 each......................	75,000.00
2 gores on the New York Central Railroad, fronting on the railroad, 6,878.80 square feet, at $2..........	13,757.60
Total	$172,719.60

Q. Do you mean to say that street lots there in your judgment are worth only $5,000 each?

A. I do, sir.

Q. Aren't you aware that there was a sale on the north side of 66th Street about 50 feet east of the railroad tracks, 40x100 feet, last
May, for about $13,000, or at the rate of $8,100 per lot
2800 taken—that would be directly across the street from this plot?

A. I am not aware of any such sale, sir.

Q. Well, if that be true, that a sale was made there as recently as last May on the north side of 66th Street directly across from this property at the rate of $8,100 a lot, wouldn't that modify your judgment that street lots are worth only $5,000 there?

A. Not unless I knew something of the circumstances of the sale, and I have not admitted the sale, either.

Q. I understand that. I have not admitted, either that your estimates are correct.

A. Well, unless I knew the circumstances of that sale it would not change my opinion in the slightest.

Q. Now take Block 1157, bounded by 65th and 66th Streets, West End Avenue and Amsterdam Avenue, if you please, and give the analysis of your estimate of $602,844.60.

A. —

2 Amsterdam Avenue corners, 5,084 square feet....	$50,840.00
2 lots adjoining corners........................	27,500.00
4 inside lots at $12,500 each....................	50,000.00
48 Lots on 65th and 66th Streets at $8,000..........	384,000.00
2 West End Avenue corners, 5,084 square feet......	30,504.00
2 lots adjoining corner at $11,000 each.............	22,000.00
4 inside lots at $9,500 each......................	38,000.00
Total	$602,844.00

Q. Will you give us the same analysis of your figures of $40,000 for Block 1156, Lots 45 and 46?

A. Four lots, at $8,000, $32,000.

Q. Now turn, please, to page 9 of Exhibit 48 and give us the analysis of your figures of $496,576 for Block 1670, bounded by First and Second Avenues and 98th and 99th Street?

A.—

2801 2 corners on Second Avenue, 5,184 square feet, at $8	$41,472.00
2 adjoining corners on Second Avenue at $13,000.....	26,000.00
4 inside lots at $12,000 each......................	48,000.00
2 corners on First Avenue, 51,184 square feet, at $6 a square foot, or.............................	31,104.00
2 lots adjoining corners on First Avenue at $11,000 each	22,000.00
4 inside lots at $10,000 each......................	40,000.00
36 inside lots at $8,000 each......................	288,000.00

Q. Is that on both 98th and 99th Streets the $8,000?

A. Yes, sir. Total, $496,576.00.

Q. Are you familiar with 227 to 231 East 98th Street? Do you know what character of improvements there were on that last year, say a year ago?

A. They were vacant.

Q. Do you know what they sold for in December, or about that?

A. I have no record of it, no, sir. A nominal consideration, my records give it.

Q. Now give us the analysis, if you please, of Block 1692, estimated at $201,358?

A.—

2 corner lots on First Avenue, 5,184 square feet......	$31,104.00
2 lots adjoining corners at $8,800 each..............	17,600.00
4 inside lots on the avenue, $8,000 each............	32,000.00
2 gores on marginal street, 9,163.50 square feet, at $14.00	36,654.00
14 street lots at $6,000 each.........................	84,000.00
Total	$201,358.00

Q. Now, you have given the value of the street lots in Block 1670 between 98th and 99th Streets at $8,000.00. If it be a fact that 227 to 231 East 98th Street between Second and Third Avenues and close to Second Avenue sold at the rate of $12,500 per lot or more in 1905,
vacant, as you say the land was, would not that modify your
2802 view that the interior lots are worth only $8,000 in Block
1670?

A. No, sir, I don't think $12,500.00 out of the way between Second and Third Avenues.

Q. Not if it is close to Second Avenue?

A. No, sir.

Q. Do you mean to give as your opinion that inside lots between First and Second Avenues on 98th Street are not worth more than 65 per cent. of inside lots on 98th Street between Second and Third Avenues and much nearer Second than Third?

A. In this location, yes, sir. Between Second and Third Avenues is a new Little Italy. It is thickly settled in there; one of the biggest advances in New York City has taken place in those blocks.

Q. No reason why the territory between First and Second Avenues on 98th Street, if the gas company should sell that property, might not be used or developed in the same manner as between Second and Third Avenues, is there?

A. On 98th Street?

Q. Yes.

A. Yes, sir, that is true; but I am not speaking only of 98th Street, but of that entire section, that the property east of Second Avenue is not as valuable as that west, not by reason of the gas works, but general location.

Q. Your proposition is that lots are worth more than 50 per cent. more between Third and Second, and nearer Second, than they are between First and Second Avenues?

A. Yes, that is perfectly correct, sir.

Q. Will you now take page 10 of Exhibit 48 and give the analysis of your figures of $109,644.00 as the value of Block 1683, Lots 34 and 35?

A. Northwest corner of First Avenue and 111th Street, 2,592 square feet, at $7.00 square foot, $18,144.00.

Q. Is that in the form of a lot or does that number of square feet in it constitute a lot?

2803 A. It is a little more than a lot—2,500 square feet would be a lot. It is 2,592 square feet, 92 feet added in there, adjoining the corner, $13,000. Inside lot, $12,000; 7 street lots at $9,500 each, $66,500.

Q. In what way would you lay out this lot containing a little more than 2,500 square feet?

A. I would give three lots—oh, I would give 29.92 feet on First Avenue.

Q. For how many lots?

A. For one lot. Then the next two lots, 2,500 square feet each, giving the benefit to the corner.

Q. Will you give the analysis of the next block, 1682, between 110th and 111th Streets, west of First Avenue, which you estimate at $395,288?

A. Two corner lots on First Avenue, $36,288; 2 adjoining lots at $13,000 each, $26,000; four inside lots at $12,000 each, $48,000; 30 street lots, $285,000; total, $395,288.00.

Q. Did you make the lots $9,500 here on 110th or 111th Street?

A. Yes, sir.

Q. Now give the analysis for the block 1704 between First and Pleasant Avenues, 110th and 111th Streets which you have estimated at $396,784.

A. Two corners on First Avenue, 5,184 square feet, $31,104; two lots adjoining corner, $11,000 each, $22,000; 4 inside lots at $10,000 each, $40,000; 2 corners on Pleasant Avenue, 5,184 square feet, $25,900; 2 lots adjoining corners on Pleasant Avenue, $16,500; 4 inside lots at $7,500 each, $30,000; 16 lots on 110th Street at $6,000 each, $96,000; 13 feet extra on 110th Street at the same rate, $3,120; 16 lots on 111th Street at $8,000 each, $128,000. There are 13 feet extra on 111th Street at the same rate, $4,160; total, $396,784.

Q. Now you have placed a street lot on 110th Street, west of First Avenue, at $9,500 as against a street lot east of First Avenue at $6,000?

A. Yes, sir.

2804 Q. That is something more than 50 per cent. higher west of First Avenue. Is that your estimate of the relative value of the property east and west of First Avenue and close to it?

A. It is the difference between $8,000 and $6,000—$2,000.

Q. I thought you said $9,500?

A. Yes, sir, $3,500 difference.

Q. That is a difference of more than 50 per cent. directly west of First Avenue?

A. Yes, sir.

Q. Do you think there is that difference?

A. I do, sir.

Q. Now, on the north side of 111th Street you have placed the lots at $8,000.

A. South side of 111th Street?

Q. Yes, on the south side of 111th Street—I meant on the north side of the block. At what figure do you place street lots at 111th Street in Block 1682, being west of First Avenue?

A. $9,500.

Q. Now, are not the lots on the south side of 111th Street, between First and Pleasant Avenues, opposite some sort of a park there—Little Italy or whatever they call it?

A. It is opposite Jefferson Park.

Q. Does not that add to the value of the land?

A. I have allowed for that $8,000 as against $6,000 on the street south of it.

Q. Is it your estimate that lots opposite this Jefferson Park on the south side of 111th Street are worth only $8,000 when lots on First Avenue and not opposite the park you have given a valuation of $9,500?

A. I do, sir.

Q. Will you now give the details of Block 1999 which you valued at $397,800 between 12th Avenue, Boulevard, 132d Street and 133d Street?

A.—

Two corners on Twelfth Avenue	$27,000.00
Two lots adjoining corners at $9,900	19,800.00
Four inside lots at $9,000 each	36,000.00
Forty-five street lots at $7,000 each	315,000.00
Total	$397,800.00

2805 Q. Will you likewise give us the details of your valuation for the Sherman Avenue and Kingsbridge Road property, $97,879.50, Block 2,175?

A. The block contains 65,253 square feet at $1.50 per square foot, $97,879.50.

Q. What do you make the front lot on Sherman Avenue worth?

A. I have taken it as a plot, sir.

Q. Will you give us the estimate of the value of a lot on Sherman Avenue?

A. I can, after lunch, sir.

Q. Cannot you do it now, in a moment?

A. I cannot. I would have to divide up these lots. It is a very irregular plot.

Q. I think that is all the property respecting which you have testified?

A. I think so.

By Mr. **Burr**:

Q. Did you look at the Shadyside property?

A. No, sir, I am going to do so this afternoon if I am through here; if not, in the morning.

By Mr. **Mathewson**:

Q. You stated you examined this property about two years ago?

A. Some of it, yes, sir.

Q. How much of it?

A. Thirty-seven parcels, I think it was. In some of those appraisals there were not the full blocks as they are now.

Q. Is it easier for you to state which of the plots respecting which you have testified you examined two years ago or to specify which you did not examine?

A. I expect I can testify better to which I did examine. Block 982, Block 988, both Blocks 991, Block 972, part of Block 952, practically the whole Block of 978, practically the whole Block of 979, Block 953, Block 985, part of Block 870, part of Block 1455—almost all of 1455, Block 1474, Block 1670, almost all of 1692, 2806 1682, 1704, 715, 1070, 1157, 1998, 2175. Now the others I will have to check up.

Q. Didn't you examine 1999?

A. I was just going to say here are some here I have got to check up. Block 1071, Lots 10 to 13; Blocks 1092, 1093, 1643, 1683.

Q. You stated that your information as to the buildings and land which you have given here were derived in some degree from that examination?

A. I don' think I understand the question.

Q. You stated at the outset, Mr. Thompson, that you had examined this property and inspected it about two years ago, and I assumed from that that some part of the knowledge of the lands and the buildings about which you have testified came from this inspection of two years ago?

A. Yes, sir.

Q. Who was your client at the time you inspected that property two years ago?

A. The Consolidated Gas Company.

Q. And it was by their permission and upon their invitation that you did inspect it?

A. Yes, sir, not at their invitation but by my request.

Q. You at that time had been retained by the Consoli-ated Gas Company to testify as to some values in *certiorari* proceedings, hadn't you?

A. Yes, sir.

Q. Have you ever been retained by the Consolidated Gas Company to testify except as to tax values in *certiorari* proceedings?

A. No, sir.

Q. And you accepted a retainer and they paid you certain fees, did they not, on account for such services?

Mr. **Burr**: I object to that. I do not see the purport of these questions.

The **Master**: Well, it is difficult to say at this period, Mr. Burr. I can imagine two or three different ways in which it might be a proper cross-examination. It does not appear now, but I 2807 have got to let the counsel go on to a sufficient extent to make it apparent what he is getting at.

Mr. **Burr**: I think it is proper to inquire whether he claims because a real estate expert was employed by the Consolidated Gas Company——

Mr. **Mathewson**: No.

The **Master**: It may be that this gentleman had a disagreement about fees, and they have got a suit on, and in that case it would tend to show bias or feeling, would it not?

Mr. **Burr**: Yes.

The **Master**: That is the idea I have in mind. I do not know what he proposes to show, but I will allow the question.

A. Yes, sir.

Q. And those services included the examination, appraisement and testimony on those properties, didn't they?

A. Yes.

Q. Are not some of these proceedings still pending?

A. I believe they are.

Q. And in some of them you have not yet given your testimony?

A. Yes, sir.

Q. And under those circumstances you have accepted a retainer from the other party to the suit, that is the City of New York, to testify in this proceeding respecting values of those same plots?

A. Yes, sir.

Q. Has the City paid you?

A. No.

Q. You expect to be paid by the City?

A. I do, sir.

Q. Are any of the proceedings in which you were to testify, whether you have testified or not, yet concluded, if you know?

A. In which I have testified?

Q. Whether you have testified in them or not?

2808 A. I don't know; some they were adjusting with the Comptroller, and I don't know whether they were adjusted or not.

Q. Has there been any friction between you and the Company in reference to this matter in any way?

A. None except that I have requested them to pursue the cases, as it was very difficult to testify after the lapse of two or three years; in fact I asked them some time ago to drop me out of it, as I could not keep them in mind.

Q. You know the last adjournment was taken at the request of the Corporation Counsel, don't you?

A. I have so understood from your office, or the office of Shearman & Sterling.

Q. And you know proceedings of this kind frequently spread out to a considerable length, especially where there are a great many of them?

A. Yes, sir.

Mr. **Mathewson**: That is all.

The **Master**: Is there any re-direct?

Mr. **Burr**: Can we adjourn now?

Recess until 2 o'clock p. m.

After Recess.

JOHN THOMPSON resumed.

By Mr. MATHEWSON:

Q. The *certiorari* proceedings to which I referred at the conclusion of my examination before recess, were *certiorari* proceedings by the Consolidated Gas Company against the City of New York. You understood that?

A. Yes, sir.

Q. Did you refer the subject of your retainer by the City in this proceeding to the Consolidated Gas Company or inform them
2809 of it before you accepted this retainer?

A. I did not.

Mr. MATHEWSON: That is all.

Mr. BURR: I move to strike out all the testimony with regard to his former retainer by the Consolidated Gas Company as being immaterial, irrelevant and incompetent.

The MASTER: I will let it stand.

Mr. BURR: Exception.

Redirect-examination by Mr. BURR:

Q. Now, Mr. Thompson, has the fact that you testified for the Consolidated Gas Company in these proceedings that have been referred to by Mr. Mathewson affected your judgment at all as to the values of the property upon which you have been called to testify?

A. None whatever.

Q. In the proceedings in which you testified for the Consolidated Gas Company, did you give your honest opinion as to the valuation of the property?

A. I did.

Q. On each piece of property that you were examined with regard to?

A. Yes, sir.

Q. And have you given your honest and unbiased and unprejudiced opinion with regard to the true value of the pieces of property with regard to which you have been examined?

A. I have, yes, sir.

Q. Have the values that you have testified to here with regard to these several parcels been the same values that you gave for the Consolidated Gas Company, allowing for appreciation or depreciation since 1903 or 1904?

A. In almost every case it has been with appreciation.

Q. And they have been the same values with that appreciation since that time?

A. Yes, sir.

Q. How many cases did you testify in for the Consolidated Gas Company?

2810 A. I don't remember how many I testified in. I appraised thirty-seven different parcels, but some of the cases I have not yet testified in although I have appraised them.

Q. Referring to Block 972, Lot 45, that is an irregular plot or parcel, is it not?

A. Yes, sir.

Q. You have made no allowance for a rise of value in that plot. Will you state your reasons?

A. Simply on account of its shape. It is an undesirable shaped parcel and I think there has been no increase there.

Q. You have been asked several times by counsel for complainant whether the fact as he stated it was, that the assessed valuation was larger than the valuation given by you, affected your opinion as to valuation and you said it did not. Will you state your reasons why it did not affect your opinion?

A. Because I think at the beginning of 1903, that is as far back as I know, the assessed valuation of the Gas Company in almost every instance has been very high, indeed. At the time I made my examination there were only five or six pieces that I thought under or equally assessed.

Q. And you so testified in these *certiorari* proceedings, did you?

A. Yes, sir.

Q. Since July, 1905, has there been any appreciation in the real estate that you have been examined regarding?

A. Well, I should say probably five per cent.

Q. There has been a rise in the value of real estate in the city generally since that time, has there?

A. Yes, sir.

Recross-examination by Mr. Mathewson:

Q. In reference to these *certiorari* proceedings by the Consolidated Gas Company against the city, in which you are under retainer by the Consolidated Gas Company, is it not true that in much the greater number of cases you have not yet testified?

2811 Mr. Burr: I object to the question as being immaterial and irrelevant.

The Master: I will allow it.

Mr. Burr: Exception.

A. I am not certain. I should say I had testified in two-thirds, certainly one-half.

Q. Is it not a fact that none of those cases, even those in which you have testified, is completed so far as you know?

A. As far as I know. I understood that some were going to be completed or compromised.

Q. And that you still claim compensation coming to you from the Consolidated Gas Company upon the completion of these cases upon which you have testified and also in those upon which you have not yet testified?

A. Yes, sir. They have my figures, my appraisements.

Q. And your retainer was to examine, report and testify?

The Master: He so stated this morning.

A. Yes, sir.

Q. Now, are you under retainer here by the City of New York or by the State?

Mr. **Burr**: Objected to as irrelevant, incompetent and immaterial.

The **Master**: I will allow it.

Exception.

A. I declare I don't know.

Mr. **Burr**: I will admit it is by the City.

The **Witness**: Mr. Burr employed me and I never asked him.

Q. Have you ever been in the buildings respecting which you have testified in connection with these parcels since you went in under retainer from the Gas Company two years ago? 2812

Mr. **Burr**: Objected to as being incompetent, immaterial and not being proper recross-examination based upon my redirect-examination which this witness has been subjected to.

The **Master**: It is hardly redirect-examination.

Mr. **Mathewson**: He has stated he took the figures then and added certain figures to them.

Mr. **Burr**: That was a matter for cross-examination.

The **Master**: Still, I am not disposed to lay down any strict rule about that. I will allow it.

Mr. **Burr**: Exception.

A. With the exception of Irving Place and 15th Street I don't think there is any.

Q. And Irving Place and 15th Street is the general office of the company?

A. Yes, sir.

Q. Where you have gone since that to confer with the officers of the company and confer respecting your testimony in the *certiorari* proceedings?

A. No, sir; on the contrary, I have never conferred with the officers of the company. My conference has been with Shearman & Sterling, and my visit to Mr. Gawtry was to sell some property in Long Island City.

Q. And you have never given any testimony for the Consolidated Gas Company as to values with the exception of values for the purposes of taxation?

A. That is all.

By Mr. **Burr**:

Q. Your testimony in those proceedings is a matter of record, is it not?

A. Yes, sir.

Mr. **Burr**: I suppose the point of these questions is to show that the Consolidated Gas Company has valuations for taxation and valuations for other purposes, of the property. 2813

Mr. **Mathewson**: We think that the valuation for taxation is different from the valuation of property as an operating concern; but whether that be so or not, I think the effect of the examination is a matter of argument.

MARTIN MCHALE, called — a witness in behalf of the defendant-, being duly sworn, testified as follows:

Direct examination by Mr. BURR:

Q. What is your business, Mr. McHale?
A. I am an appraiser of real estate.
Q. In the City of New York?
A. In the City of New York.
Q. Borough of Manhattan?
A. Borough of Manhattan; in fact I might say Greater New York.
Q. How long have you been engaged in such business?
A. Twenty-one years.
Q. Where is your place of business?
A. No. 55 Cedar Street.
Q. Will you state what experience you have had in the valuation of property in the Borough of Manhattan?
A. Well, I have had twenty-one years' experience with different concerns. With the United States Mortgage & Trust Company——
Q. Are you connected with that company now?
A. I am, sir. I am their appraiser. And the Lawyers Title Insurance & Trust Company, the Lawyers Mortgage Company, the Windsor Trust Company, Columbia Trust Company, Guarantee Trust Company, the State of New York, the Banking and Insurance Department of the State of New Jersey, and I have appraised 2814 for the City of New York and the Consolidated Gas Company, the firm of Shearman & Sterling, Davies, Stone & Auerbach, John Jacob Astor, Rollins & Rollins; and I might mention, I suppose, fifty or seventy-five other concerns and different institutions. I have appraised for the Erie Railroad.

Mr. BURR: If Mr. Mathewson desires to examine this witness as to his ability as an expert before I proceed, I have no objection.
Mr. MATHEWSON: I accept the invitation.

By Mr. MATHEWSON:

Q. You say you have been an appraiser of real estate for twenty-one years in the Borough of Manhattan?
A. I have.
Q. Have your appraisals been confined to any special part of the Borough?
A. No, sir.
Q. Have they been more largely in one section than in another?
A. No, sir; general appraisals throughout the city.
Q. Are you a member of any firm?
A. I am not.
Q. Have you been during that period?
A. No, sir; I have been for myself individually.
Q. Have you bought and sold real estate?
A. I have, some; but I am not a broker. I make a specialty of appraising.
Q. From what sources do you obtain your information from which

you express an opinion as to the value of real estate or form your estimate as an appraiser?

A. I keep records of all the transfers in the City of New York; I associate with different real estate men and ascertain the consideration, when it is possible, and keep myself generally posted in regard to sales, leases and everything pertaining to real estate.

Q. Have you ever sold any bulkhead property?

2815 A. Bulkhead property? No, but I have some for sale.

Q. Well, that may be, have you ever bought any?

A. I never bought any.

Mr. **Mathewson**: I object to the testimony of the witness as to values on the ground that he is not an expert qualified to testify according to the standards established, and he has not purchased and sold real estate.

The **Witness**: I have not said that I have not. I have said that I have sold real estate.

The **Master**: I will take it and give you an exception.

Mr. **Mathewson**: I will ask one more question. I misunderstood the witness.

Mr. **Burr**: I might say that I intend to ask this witness as to the bulkhead property.

Q. To what extent have you bought and sold real estate in the city?

A. I am connected with the United States Mortgage & Trust Company, and where we have a trustee sale I always appraise the property, and it is sold generally on my appraisal, consisting of property all the way from tenement houses up to private houses.

Q. Sold upon your appraisal?

A. Yes, sir.

Q. But have you bought and sold property personally?

A. Personally, yes, sir. And own property myself.

Q. And what did you mean by saying you were not a broker?

A. I am not a broker. I only do it for my own individual self, that is, as far as the question of purchasing and selling.

Q. To what extent have you purchased and sold?

A. Not so very much. I have bought 132, 134 and 136 West 41st Street, and sold it; I have bought 181 Lexington Avenue, 2816 and sold it; 86 Lexington Avenue, and several pieces throughout the city. That is, I speculate for my own individual self, as a rule. I am not a broker and avoid it as much as possible and absolutely refuse brokerage business.

Q. What is your connection with the United States Mortgage & Trust Company?

A. Superintendent of real estate.

Q. What are the duties of that position?

A. The duty is to look after loans, also to look after leases, &c., and buildings. We have all the way from tenements up to a two million dollar building to look after.

Mr. **Mathewson**: I press the objection again, Mr. Master.

The **Master**: I will overrule it.

Mr. **Mathewson**: Exception.

By Mr. **Burr**:

Q. You have been retained by the City to examine for the purposes of appraisal the property of the Consolidated Gas Company, including bulkhead property claimed by it?

A. I have.

Q. And you are familiar with the exhibit which has been offered in evidence here, Exhibit 48?

A. I am.

Q. We will take up that exhibit and examine with regard to each parcel, taking first the parcel of property, Block 1643, situated at the southwest corner of Lexington Avenue and 116th Street. Will you give me the dimensions of that property and state what in your opinion is the proper value of that piece of property?

A. It has a dimension on 116th Street of 80 feet and on Lexington Avenue of 100.99 feet, and is practically three full city lots.

Q. What is the value of it?

A. $84,386.40.

Q. Are there any buildings on it?

2817 A. There is none except one little wooden structure which adds nothing to the value of the property.

Mr. **Mathewson**: That appears to be exactly to a cent what the testimony of Mr. Thompson is.

The **Witness**: We examined it together and agreed exactly as to the valuation of it; in fact we have examined it three times together.

Q. Did you say three times together?

A. We did, at least three times together.

Q. When?

A. We examined it twice for the Consolidated Gas Company and once for the City of New York, which was here about—some time ago.

Q. You examined it for the Consolidated Gas Company?

A. I did.

Q. How long ago is that?

A. Nearly two years ago, in the year of 1904, anyway.

Q. Take the next parcel as it appears on page 1 of Exhibit 48, Block 1642, being the parcel situated on 114th Street, between Third Avenue and Lexington Avenue, and describe that property and the buildings, if there are any, and give your valuation of it.

The **Master**: As all the other witnesses have given a description and the dimensions of the property, is it necessary to go over it every time. So long as you get the block numbers and identify the lots, is it necessary to go over all the description?

Mr. **Burr**: I thought Mr. Mathewson might require it to show that this man had familiarized himself with the property.

Mr. **Mathewson**: I do not think to that extent, but it seems to me it might be proper to say, facing so many feet on Third Avenue and so many on 114th Street.

2818 Mr. **Burr**: And whether there are any buildings on it.

Mr. **Mathewson**: Yes.

A. Block 1642, it has dimensions on Third Avenue of 25 feet 2¾ inches by 150 feet deep; that is, it is equal to three full city lots, one on Third Avenue and two on 114th Street.

Q. Give the valuation, please?

A. $59,104—No, $74,104.00.

Q. Is not this your figure for that parcel?

A. No, I am mistaken, it is $89,104.00.

Q. Are there any buildings on that property?

A. There are two buildings.

Q. Does that amount which you have just given include the buildings?

A. It does.

Q. Have you made any separate valuation of the buildings?

A. I have.

Q. What is that valuation?

A. The buildings $15,000.00 and land $59,104.00.

The Master: That does not foot up.

The Witness: No, $59,104.00, and buildings $15,000.00.

Mr. Mathewson: Mr. Thompson testified that the land was $74,104.00, and buildings $15,000.00, making $89,104.00, or the total which you gave.

The Witness: Northeast corner of Third Avenue and 114th Street, containing 2,592 square feet, at $12.00 a foot, would be $31,104.00. I have got two inside lots on 114th Street at $14,000.00 each, $28,000.00.

By the Master:

Q. The first figures you gave were right, $74,104.00 for the land and the buildings?

A. Yes.

2819 Q. Of that $15,000.00 is buildings?

A. Yes.

Q. Mr. Thompson corrected his error on cross-examination?

A. Yes.

By Mr. Burr:

Q. What is the correct count?

A. $74,104.00.

Q. Take the next parcel, Block 870, situated at the corner of Irving Place and 15th Street. What does that parcel consist of?

A. Situated on the southeast corner of Irving Place and 15th Street. It is improved by a 4-story, really a 3-story and basement building, used for the general offices of the Consolidated Gas Company. Next to that is a 4-story building.

Q. What is the value of it?

A. The value of the property is $196,491.20.

Q. Does that include the buildings and all?

A. It did.

Mr. Mathewson: Well, in each case through this, as you give valuations including buildings, do you include the same amount that Mr. Thompson did in his appraisal?

The Witness: Merely in the buildings. We differed considerably in different parcels as to the land, but as far as the buildings are concerned, we examined them together and practically agreed as to the value of the buildings.

Q. Take the next parcel on page 1 of Exhibit 48, Block 239, the property situated on Elizabeth Street and Hester Street, and briefly describe what property it is.

A. The property has a front of 100 feet on Hester Street and 150 feet on Elizabeth Street. There are practically four lots on Hester Street and two lots on Elizabeth Street. The Hester Street property
is a two-story and basement building used for offices and there
2820 is another small building in the rear—not a small building;
in fact, it is a building about 50 feet deep, used for storage for pipe and a stable and other things like that, in connection with the gas company.

Q. What valuation do you put upon that parcel?

A. $167,500 for the land. In my opinion the buildings did not add anything to the market value of the land.

Q. On page 2 I call your attention to Block 972, an irregular piece on 15th Street, between Avenue A and Avenue B. Will you describe that property and state what, in your opinion, is the just valuation of it?

A. Situated on the southerly side of 15th Street, distant 350 feet westerly from Avenue B. It is an irregular shape and has a frontage of 13 feet on 15th Street, and as near as I can judge from the dimensions of it—I have divided it up into two separate parcels——

By Mr. Mathewson:

Q. It is about 150 feet on the southerly side?

A. Yes, and on the easterly side it has 106.70 feet and on the westerly side 10.50 feet.

By Mr. Burr:

Q. What is the value?

A. The total for the property is $12,279.39.

The Master: Could you not make it 37 cents?

Mr. Mathewson: Mr. Thompson's value was 37 cents.

The Witness: Thirty-seven cents, yes.

Q. Take the next parcel, Block 985, running through from 17th to 18th Street on Avenue C and Avenue B and describe that parcel.

A. Property situated between Avenue B and Avenue C. It is
situated between 17th and 18th Streets, and has a frontage
2821 on 18th Street of 350 feet and the same distance on 17th
Street, or equal to twenty-eight city lots, at $7,000 per lot, $196,000.

Q. Any buildings on it?

A. No buildings on it.

Q. Now take Block 982, the parcel running through from 14th to 15th Streets, between Avenue- C and D.

A. The northwest corner, $12,000 a lot, and there is a little more than a full lot there; in my opinion a full lot, 2,500 square feet would be worth $12,000, and this lot has 2,814.38 square feet at $4.40 a foot, or $12,832.72.

Q. Well, give us the total valuation?

A. $255,012.10.

Q. Take Block 989, Lot 1, and describe that and give its value.

A. It is situated between Avenue C and Avenue D. They own the whole block with the exception of the center; in other words, they own—I shall have to describe that, Mr. Burr, in order to get that right.

Q. Go ahead.

A.—

I have taken the northeast corner of Avenue C and 15th Street, 2,840.21 square feet at $4 a foot equal to $11,000 a lot or	$11,360.80
Lot adjoining the corner of 15th Street, 2,839.10 quare feet, at $3.45 would be	9,794.90
Four inside lots of the same dimensions at $3.30 would be	37,476.12
Lot adjoining corner of 16th Street, taking the same number of square feet, which is 2,839.10 at $3.45, would be	9,794.90
Southeast corner of Avenue C and 16th Street, contains 2,840.21 square feet at $4 a square foot	11,360.80
I have taken ten street lots there at $6,000 a lot, which would be	60,000.00
And the total for that portion would be	$139,787.52
2822 The southwest corner of Avenue D and 16th Street, 2,349.62 square feet, at $3.60 would be	8,458.63
Lot adjoining the corner of 16th Street, 2,348.71 square feet, at $2.94, would be	6,905.21
Four inside lots, 2,348.71 square feet each, would equal 9,394.84 square feet, at $2.80	26,305.55
Lot adjoining the corner of 15th Street, 2,348.71 square feet, at $2.94	6,905.21
Northeast corner of Avenue D and 15th Street, 2,349.62 square feet, at $3.60, would be	8,458.03
Eight street lots, $6,000 a lot	48,000.00
	$105,032.63
Or a total for the whole block of	$244,820.15

By the Master:

Q. How is that subdivided between Lots 1 and Lot 26?

A. Lot 1 is $139,787.52, and Lot 26 is $105,032.63.

By Mr. Burr:

Q. Now take Block 991, Lots 26 and 50.

A. I think there are two 991's.

Q. Take the one bounded by Avenue D, Tompkins Street, East 15th Street and East 16th Street?

A. That is an irregular plot situated between 15th and 16th Streets and Avenue D and Tompkins Street which I valued at $115,683.27.

Q. Take the other parcel also appraised in Block 991 between 14th and 15th Streets?

A. Situated between 14th and 15th Streets, Avenue D and Tompkins Street, valuation $177,435.52.

2823 Q. Now I call your attention to Block 988, being the parcel embracing block between 14th and 15th Streets, Avenue D and Avenue C.

A. Block 989, situated between 14th and 15th Street-, Avenue C and Avenue D, taking in the whole block, which I valued at $383,873.15.

Q. Now take Block No. 688, on page 3 of Exhibit 48, and describe that parcel, stating what in your opinion is the value of it?

A. Block 688, situated between 16th and 18th Streets, Tenth Avenue and the marginal street, my valuation is $322,187.20.

Q. Now take the parcel just above, Block 689.

A. 689 is situated between 17th and 18th Streets, Tenth Avenue and the marginal street, which I value at $402,347.20.

Q. And the parcel just above that, Block 690, between 18th and 19th Streets and Tenth Avenue and the marginal street.

A. It takes in that whole block with the exception of a portion of 19th Street, which I value at $413,822.52.

Q. Now I refer you to Block 691, on page 3 of Exhibit 48, 20th Street and marginal street.

A. That is situated between Tenth Avenue, marginal street, 109 feet 8 inches on 20th Street and 119 feet on 19th Street, which I value at $164,479.20.

Q. Now take Block 716, Lot 14, and just describe its location?

A. It is situated on the north side of 18th Street, a distance of 275 feet east of Tenth Avenue. It is three full city lots. In my opinion it is worth $12,000 a lot, or $36,000 for the three.

Q. Now take Block No. 715.

A. That is situated on the south side of 18th Street, a distance of 150 feet from Tenth Avenue, and my unit of value is the same there, $12,000, or $108,000 total value. There are nine full city lots.

Q. Now take Block No. 951, on page 4 of Exhibit 48, situated on the southerly side of East 20th Street, between Avenue A and First Avenue.

2824 A. Yes, sir; it is situated on the south side of 20th Street, distance 94 feet west of Avenue A. Seven full city lots; in my opinion worth $7,000 each, or $49,000 for the plot; and I add $10,000 for the buildings, making $59,000.

Q. Now take Block 952.

A. That takes in the whole block with the exception of the First Avenue frontage, which I place value on of $350,200.

Q. Were there buildings on that?

A. Yes, sir. I add $20,000 for the buildings, making a total of $350,200. Do you wish me to describe the buildings?

Q. Yes, you might?

A. No. 333 Avenue A, an old four-story brick tenement with about 20 feet front, occupied by two families employed by the Gas Company. In my opinion it adds to the market value of the land about $3,000.

No. 335 Avenue A, an old four-story brick building, 19 feet front, which adds to the market value of the land in my opinion about $3,000.

No. 341 Avenue A, southwest corner of 21st Street, of a plot 65 x 94; a two-story brick machinery building, which adds to the market value of the land about $6,000.

No. 327 Avenue A, a four-story building on plot 69 feet 6 inches by 70 feet, used as storage house; value about $6,000.

By Mr. Mathewson:

Q. That makes how much all told for the buildings?

A. Makes all told for the buildings, $20,000.

Q. That would leave $330,000 for the land?

A. $330,200 for the land, sir.

By Mr. Burr:

Q. Wherever there are any buildings on any of these parcels you might briefly refer to them, or structures of any kind.

A. Yes.

Q. Take Block 953, parcel comprising the whole block
2825 between First Avenue and Avenue A, 21st and 22d Streets.

A. Parcel 953 takes in the whole block from First Avenue to Avenue A, and from 21st to 22d Street. I value it at $403,000.

Q. Are there any buildings on that?

A. There are no buildings on that; that is, which in my opinion add anything to the value of the land.

Q. Now take Block 979, on page 4 of Exhibit 48.

A. Block 979 is situated between 21st and 22d Streets, Avenue A and the marginal street, which I value at $401,963. There is a one-story building on it used by the Gas Company, which in my opinion adds nothing to the market value of the land.

Q. Now take Block 978.

A. Block 978 is situated between Avenue A and Avenue B, and 20th and 21st Streets, and takes in the whole block with the exception of a parcel in the centre of the Avenue A frontage, about 23 feet in depth by 100 feet. The land I put in at $389,264. There are some buildings on that. No. 326 Avenue A, corner of 21st Street, a four-story tenement, store on first floor vacant. In my opinion the building is worth about $4,000.

Q. What is your total valuation of that parcel?

A. And there are two more buildings on the avenue, two tenements; they are worth about $8,000, or $4,000 each. My total for the whole block is $411,264. All told the buildings in my opinion, add about $12,000.

Q. Now, take Block 987, an irregular piece fronting on the marginal street, between the marginal street and Avenue B and 20th and 21st Streets.

A. Block 987 is situated between Avenue B and 20th and 21st Streets and the marginal street. In *In* my opinion it is worth $83,873.96.

Q. Any buildings?

A. No buildings on it that add anything to the market value, in my opinion.

2826 Q. Now, take Block 1090, on page 5, of the Exhibit 48, on 42d Street, Lot No. 23, west of 11th Avenue.

A. 1090, yes, sir; situated on the north side of 42d Street, a distance of 100 feet west of 11th Avenue. There are six full city lots at $12,000 each, making $72,000. A one-story building there that I did not think added anything to the market value of the land.

Q. Take the next parcel, Block No. 1071?

A. 1071 is situated on the north side of 42d Street, a distance of 225 feet east of 11th Avenue. There are four full city lots worth $13,000, in my opinion, each, or $52,000. Those lots are vacant.

Q. Now, take Block 1070.

A. Block 1070 is situated on the north side of 41st Street, a distance of 200 feet from 10th Avenue. There is a one-story brick building which, in my opinion, adds nothing to the market value of the land. There are eight full city lots at $10,000, or $80,000.

Q. Now, take Block No. 1089, between 41st and 42d Streets and west of 11th Avenue.

A. Block 1089 takes in the whole block between 41st and 42d Streets, 11th and 12th Avenues. Now, I value that in two ways; assuming that the Gas Company does not own 12th Avenue, I put that plot in at $599,500. Assuming that they do own it I put it in at $779,500. In other words, 10 lots at $11,000 each on 42d Street would be $110,000; 10 lots on 41st Street at $7,000 would be $70,000 or $180,000 for the portion which is occupied as Twelfth Avenue.

Q. Take Block 1092, on page 6 of the Exhibit.

A. Block 1092 takes in the whole block between 11th and 12th Avenues with the exception of the 11th Avenue frontage and one lot in 45th Street, being 28 lots on 44th Street at $8,000 each, which would be $224,000; 27 lots on 45th Street at $7,500 each, which would be $202,000, or $431,000 for the property. Now that is assuming the Gas Company does not own 12th Avenue——

2827 By Mr. MATHEWSON:

Q. How much of that is for buildings?

A. Well, the buildings—there are three little buildings on 306, 308 and 310 West 45th Street, one of them 16 feet 8 inches by 45 feet, a three-story brick building, the other one is a two-story brick building, with an extension. The land I put in at $581,500. The buildings, in my opinion, add——

Q. We are talking now of the property, assuming the company does not own the street. You gave $431,000 as the value?

A. Yes, sir.

Q. My question was how much of that was for buildings?

A. $4,500. The land was $426,500. And the buildings, in my opinion, add about $4,500 to the market value of the land.

By Mr. **Burr**:

Q. Have you given two figures there?

A. Not yet. Now, assuming that the Gas Company does own 12th Avenue, it would be 10 lots on 44th Street at $8,000 each or $80,000; 10 lots on 45th Street at $7,500, which would be $75,000, or a total for the land and buildings of $586,000.

By Mr. **Mathewson**:

Q. The same buildings as before being included, $4,500?

A. The same buildings as before being included, $4,500.

By Mr. **Burr**:

Q. Have you considered that as upland?

A. I have considered that as upland, yes, sir.

Q. You have not considered it as land under water?

A. No, sir. I have not.

2828 Q. Now take the block between 45th and 46th Street- and Eleventh Avenue and the river.

A. Block No. 1093?

Q. Yes.

A. That block is situated between 45th and 46th Streets and takes in the Eleventh Avenue frontage, and twenty-three lots on 45th Street and twenty lots on 46th Street. Assuming that the Gas Company does not own Twelfth Avenue it would be $332,500. Assuming that they do own it it would be $487,500.

By the **Master**:

Q. Was your valuation of the other one the same as Mr. Thompson's?

A. Just the same. We examined the property together several times and came to the same conclusion.

By Mr. **Burr**:

Q. What did you say was the valuation if the city owned Twelfth Avenue?

A. $487,500.

Q. And if the Gas Company owned Twelfth Avenue what is the value?

A. Well, I mean—no—if the city owned it it would be $332,500, but assuming the Gas Company owns it it would be $487,500.

Q. Now take page 7 of Exhibit 48, Block 1457, between 62d and 63d Streets and First Avenue and Avenue A?

A. Situated between Avenue A and First Avenue and between 63d and 62d Streets; occupied by two gasometers, one in process of construction, not yet finished—it was not the other day when I was up there. There are nineteen and one-quarter city lots at $8,000, or $154,000.

Q. The next parcel is Block 1455, on the same page of the exhibit, parcel commencing on Avenue A from 60th to 61st Street?

A. Parcel 1455. My valuation on that is $194,000.

2829 Q. The next parcel is Block 1474, an irregular piece at the corner of Avenue A and 60th Street?

A. Yes. My valuation on that is $26,150.

Q. Now turn to page 8 of the exhibit, and I call your attention to Block 1177, which is located between West End Avenue and the Hudson River Railroad and 65th and 66th Streets?

A. Yes, sir. My valuation on that is $172,719.60.

Q. Now go to the other parcel, Block No. 1157, that takes in the whole block between West End Avenue and Amsterdam Avenue?

A. That takes in the whole block between West End Avenue and Amsterdam Avenue and 65th and 66th Streets. My valuation on that is $602,844.

Q. Now there is a small parcel on the southerly side of 65th Street, Block 1156, between the same avenues?

A. Yes, sir.

Q. What is the value of that parcel?

A. $40,000. That is $32,000 for the land, and the buildings $8,000, making a $40,000 total.

Q. Now we will turn to page 9 of the exhibit and I call your attention to Block 1670, which is a parcel embracing the whole block between Second Avenue and 98th and 99th Streets.

A. Yes, sir, taking in the whole block from Second Avenue to First Avenue and 98th to 99th Streets. My valuation on that is $496,576.

Q. Are there any buildings on that property?

A. None, sir, in my opinion, that add anything to the market value.

Q. Now, take the parcel, Block No. 1692, appearing on the same page, bounded by the marginal street, First Avenue and 98th and 99th Streets.

A. Takes in the whole block with the exception of the Second Avenue frontage.

Q. That is an irregular piece, is it not?

A. 1682?

Q. No. 1692.

A. Oh, 1692? That is an irregular piece situated between
2830 First Avenue and marginal street, 98th and 99th Streets. My valuation on that is $201,358.

Q. That does not include bulkhead or pier values?

A. It does not. I have not so far included any bulkhead or pier properties in any of the parcels I have testified to. I have made a separate item of them.

Q. Take Block 1683 on page 10 of the exhibit, which appears to be an irregular piece of parcel situated between First Avenue and Second Avenue and 111th and 112th Streets.

A. Yes.

Q. Briefly describe that and its values, please.

A. It is situated west of First Avenue, having a frontage on First avenue of 100 feet and a depth of 225 feet on 111th Street, running through to 112th Street; vacant, with the exception of a small brick building in the rear of lot facing on 111th Street; on the 112th Street side that is vacant. Value of that property in my opinion is $109,644.

By Mr. MATHEWSON:

Q. Well, you have got in 25 feet more than Mr. Thompson did?
A. Yes, there are only 3 lots on First Avenue.
Q. 75 feet 11 inches?
A. Yes, sir.

By Mr. BURR:

Q. Take Block 1682, between 110th and 111th Streets and from First Avenue to Second Avenue.
A. That is situated between 110th and 111th Streets, First Avenue and Second Avenue, with the exception of the Second Avenue frontage. My value on that is $395,288.
Q. Take Block 1704 next.
A. Yes, sir; that takes in the whole block between 110th and 111th Streets, First Avenue and Pleasant Avenue.
Q. Are there any buildings on that?
A. No, sir.
2831 Q. Yes, there are some buildings on that, aren't there?

Mr. MATHEWSON: Mr. Thompson testified there were buildings there.

A. There is a one-story brick and also a frame building but I have not added——
Q. You mean you have disregarded the buildings entirely?
A. Yes, sir; in my opinion they add nothing to the market value of the property.
Q. What do you say the valuation of that was?
A. The valuation of the whole property is $281,584.
Q. That does not include the bulkhead, does it?
A. It does not, sir; nor the land under water.
Q. The next parcel appears on page 11 of the Exhibit, Block No. 1999?
A. 1999; yes, sir. That is situated on 132d and 133d Streets, between 12th Avenue and Broadway——
Q. And the Boulevard?
A. Well, it is really called Broadway now, sir. That takes in the whole block with the exception of the Broadway frontage. In my opinion it is worth $397,800. The improvements, in my opinion, do not add anything to the market value of the land.
Q. Turn to page 12 of the Exhibit and I call your attention to Block 2175, situated on Kingsbridge Road and Sherman Avenue.
A. Yes, sir.
Q. What is the value of that?
A. $97,879.50.
Q. That, I think, includes all the property?
A. Yes, sir; except bulkheads and land under water.

Q. What is your total valuation of this?
A. This is for the upland and buildings only.

By Mr. **Mathewson**:

Q. Excluding bulkheads, land under water, docks, etc.
A. Yes, sir. The total value is $9,822,565.74.

2832 By the **Master**:

Q. On what basis does that cover the 12th Avenue property?
A. That is assuming that the Gas Company does own 12th Avenue.

By Mr. **Burr**:

Q. You have not given the value of Shady Side?
A. No, sir; I have not. I treat that practically as really water front property.

Cross-examination by Mr. **Mathewson**:

Q. For Block 1643 you give the same valuation $84,386.40, as was given by Mr. Thompson.
A. Yes, sir.
Q. Did you reach the figures by the same valuations in detail as he did?
A. I think the chances are that we did, that we examined the property together and we concluded that that land was worth so much, that that property was worth so much.
Q. Well, will you state the details of the valuation by which you reached that total?
A. Yes; 1 inside lot at $20,000; 1 adjoining lot next to the corner, I have added ten per cent., which would be $22,000; 1 corner lot, in my opinion, situated where that particular piece of property is on a thoroughfare, that is worth 75 per cent. more than an inside lot, and I have given you the benefit of the corners, in other words, giving more than a corner, 3,027.60 square feet at $14 a square foot, which would be $42,386.40, or a total for the property of $84,386.40.
Q. Where you have given the same total as Mr. Thompson I do not wish to take time to examine you specifically on each block and ask you to specify the detail which you employed to reach the total if you are able to say you reached the total by the use of the same detail that Mr. Thompson did.
A. In a great many of them; in several we differed.

2833 Q. Where you reached exactly the same totals that he did, did you then use the same method in each case?
A. Yes.
Q. So it is not necessary for me to take up those now in examining you, is it?
A. No, sir.
Q. That is right? isn't it?
A. It is.
Q. You have present here the detail showing exactly how you reached those totals in each case, I suppose?

A. I have, yes, sir, every one. Those I worked out myself.

Q. But where your total valuation coincides exactly with Mr. Thompson's you worked them out together?

A. Yes, sir.

Q. And your method is the same?

A. Exactly the same. We worked them out jointly. In fact we worked them all together but did not agree on some.

Q. And where you did not agree on them all you have so stated in your testimony?

A. I have.

By the **Master**:

Q. In all cases where you do not agree your figures seem to have been higher than Mr. Thompson's?

A. Yes, sir.

By Mr. **Mathewson**:

Q. Taking Block 1642, office buildings, etc., of the Consolidated Company at the northwest corner of Third ave. and 114th Street, you have figured land at $59,104, and the buildings at $15,000, making a total of $74,104?

A. We did, sir.

Q. You do not wish to be understood as saying that those buildings could be reproduced for $15,000, do you?

A. It is not the structural value of them at all, sir.

Q. They could not in your judgment be reproduced for that?

A. In my opinion they would cost a good deal more.

2834 Q. And what you have taken in these cases where you have included buildings is what the buildings on the land would add to the value of the land if the land were sold under ordinary circumstances?

A. In my opinion, yes, sir.

Q. In your opinion?

A. Yes, sir.

Q. I am glad it is your opinion, because Mr. Thompson said he knew in some cases, and I doubted it.

A. I prefer to say it is my opinion, sir.

Q. In other words, Mr. Thompson testified that his original figures of two years ago also were made up for the purpose of testifying in *certiorari* proceedings to reduce the amount of taxes; is that your case as well?

A. It was my case as well, sir.

Q. You and Mr. Thompson were associated in that case, were you not?

A. We were engaged by Shearman & Sterling, for the Consolidated Gas Company.

Q. And you understood that the tax law of the City of New York, as provided in the charter, specified that the assessor should state the amount for which under ordinary circumstances the real estate would sell?

A. I did well, sir.

Q. So no matter what the structural value of the buildings on the property was, or no matter what the value might be to the Company itself in using the buildings, you merely took that value of the buildings which would indicate the amount for which the property would sell beyond the bare value of the land if the property were sold, is that right?

A. The building may be very useful to the Company, but in my opinion what it really added to the market value of the land is the value I placed on the property when I appraised it.

Q. And you have on that basis simply added now as Mr. Thompson did, I assume, the increase in value which took place since
2835 you made your original figures, say two years ago.

A. Well practically three years, for the reason that the values——

Q. Well, whatever it may have been.

A. Yes, sir. The *certiorari* was for 1903, and these are really 1906 values.

Q. For instance, taking the manufacturing plant of the Consolidated Gas Company, if that land was sold with improvements in other directions it would not be your idea that the manufacturing plant of the Company would add anything particularly to the value of the land to a purchaser?

A. In that same place it would be a detriment because it would cost something to remove them.

Q. And in this case you would not only add nothing to the value of the land but you would rather deduct something from it?

A. No, I would not, I would simply ignore the structures—I could not call them improvements—ignore them and treat it as vacant land.

Q. Your idea would be in taxation, the amount fixed would be the amount of the value of the land practically nothing added for the plants if they were to be sold under ordinary circumstances?

A. I would rather not pass an opinion as to taxation.

Q. No, but that would be the theory on which you would testify in reference to taxation?

A. That is the theory I should appraise it on, yes, sir.

Q. For the purposes of taxation?

A. I don't say so.

Q. That is the theory on which you would appraise it if you were determining the amount for which under ordinary circumstances it would sell?

A. It would sell for, yes, sir.

Q. And that is the method which you did pursue in conjunction with Mr. Thompson in making up your figures as you have presented them here?

A. It was the method I pursued, yes, sir.

2836 Q. Now in reference to Block 870, the offices at Irving Place and 15th Street, your total for the buildings and land was how much?

A. $196,491.20.

Q. Of which you allowed buildings, $27,000, as the amount which would add to the selling price of the land?

A. I did.

Q. And you did not allow $27,000 for the buildings on the theory that they could be reconstructed for that amount?

A. I am positive they could not. Being familiar with buildings I know they could not. What I mean is the structural value.

Q. Yes, exactly.

A. Yes, they could not be reproduced for that.

Q. Now take next the Block No. 239 at the northeast corner of Hester and Elizabeth Streets. You say you have appraised that at $167,500 and have allowed nothing for buildings. Now the office buildings of the company on that corner are worth something, aren't they?

A. They might be to the Gas Company, but my opinion is that they don't add anything to the market value of the land. That neighborhood is entirely devoted to tenements.

Q. In other words you think if the land was sold that the purchaser would remove those buildings and put something in their place?

A. He would not consider the buildings at all, in my opinion.

Q. Considering now Block No. 972, the irregular piece on Avenue A west of Avenue B—the very irregular piece with a small frontage on 15th Street west of Avenue B?

A. Yes, sir.

Q. It appears that that property is appraised by you at $12,279.37, but it is assessed for $20,000?

A. Yes, sir.

Q. For taxation?

A. Yes, sir.

Q. Did you consider that in reaching your conclusion of value?

A. I never consider assessed valuations at all in reaching value.

2837 Q. Isn't it your experience, speaking generally, that the values fixed by the assessors for the purposes of taxation are less than the actual value of the land?

A. Ordinarily they are. I have known in several cases where it has been far above.

Q. But as a general proposition my question would be answered in the affirmative?

A. Oh, I think in the majority of cases, yes; but it has no real bearing, in my opinion. In fact in making up my values I never look at the assessed valuation at all. I do not know what it is assessed at to-day.

Q. It is in evidence that it is $20,000.

A. I have not the slightest idea, sir.

Q. Take Block 985, which you valued at $196,000, between 17th and 18th Streets. It is in evidence there are certain coal sheds and a coal office there which would cost something to construct. I assume, as you say you included nothing for the buildings, that you allowed nothing for them?

A. Nothing. Simply valued it as vacant land.

Q. Take Block 982, on which you have placed a valuation of $255,012?

A. Yes, sir.

Q. Give the detail by which you reached that total.

A. Northwest corner of Avenue C and 14th Street, I put a lot in there at $12,000, there being 22,814.38 square feet at $4.40, which would be $12,832.72. The adjoining lot, same number of square feet, at $3.50, would be $9,846.56; there are four inside lots, or 11,253.16 square feet, at $3.20, which would be $36,010.11; an adjoining corner on 15th Street, 2,813.29 square feet, at $3.40, or $9,565.19; northwest corner of Avenue C and 15th Street, 2,814.38 square feet, at $4 a square foot, which would be $11,257.52; thirteen inside lots on 14th Street, at $7,000 each, which would be $91,000; thirteen inside lots on 15th Street, at $6,500, which would be $84,500.

Q. You have given the total as $255,012.10 for this Block 982?

A. Yes, sir.

2838 Q. And it appears in evidence it has been assessed at $275,000 for the land only. Does that affect your estimate of its value at all?

A. It does not.

Q. You have given the detail by which you reached your total of $244,820.15?

A. Yes, sir.

Q. For two parcels in Block 989, and it appears in evidence that the assessed value of the land is greater slightly than the total that you have given for your value, to wit, $245,000, and I ask you the same question, whether that modifies your judgment of the value of that plot?

A. The assessment, sir, would have no bearing at all on the value as far as I am concerned. I really don't know what they are assessed at.

Q. Take Block 991, Lot 26, between Tompkins Street and Avenue D, and East 15th and East 16th Streets. It appears that that is assessed at $115,000 for taxation?

A. Is that 991-A or 991-B?

Q. Twenty-six, the upper one, the small lot, $115,000, which is exactly what you give as the structural value?

A. Market value rather.

Q. The market value I mean. And this assessment is for the land alone?

A. It is, sir.

Q. It is in evidence that there are certain coal storage structures and buildings on this plot, and I understood you to say you had included nothing in your $115,683.27 for those?

A. No, sir, I did not.

Q. And the fact that the land alone is assessed at substantially the figure you give would not affect your judgment at all?

A. No, it would not.

Q. Now will you give the details referring to Block 991, lots 1 to 47, being bounded by 14th and 15th Streets, Avenue D and Tompkins Street, by which you reach $177,435.52 as your total estimate?

A. Yes, sir, I have taken the northeast corner of Avenue D and
14th Street containing 2,581 square feet at $4 a foot, which
2839 would be $10,328; adjoining the corner of 14th Street would
be the same number of square feet at $2.94, which would be

$7,588; four inside lots the same number of square feet, 2,581, at $2.80, and there are 10,324 square feet at $2.80, which would be $28,907.20; adjoining the corner of 15th Street, 2,581 feet square at $2.94, which would be $7,588; southeast corner of Avenue D and 15th Street, 2,582 square feet at $3.60, which would be $9,295.20; four lots on 15th Street $5.500 per lot, would be 22,000; southwest corner of Tompkins Street and 15th Street, 2,178.21 square feet at $3.20, which would be $6,970.24; adjoining corner of 15th Street, 2,475.70 square feet at $2.52, which would be $6,238.76; four inside lots equal to 14,596.51 square feet at $2.40 a foot, or 27,851.60; adjoining corner of 14th Street there are 3.322.50 square feet at 2.52, which would be $8,372.70; northwest corner of Tompkins Street and 14th Street, 3,632.30 square feet at $3.40 per square foot, which would be $12,315.82; five lots on 14th Street at $6,000 per lot, which would be $30,000; total $177,435.52.

Q. Are you able to point to the sale of any lots in this vicinity on 14th Street at $6,000 per lot, which is the figure you have assumed?

A. Yes, if you allow me to refer to the sales.

Q. Yes; I mean within the last year or so—not too far back.

A. No, I can not.

Q. Well, how far back is there a sale?

A. You mean on that side of the street, between 13th and 14th Streets.

Q. No, on 14th Street is my question?

A. No, not on 14th Street.

Q. I say taking a lot on 14th Street?

A. No, sir.

Q. Is 14th Street a broader street than 15th Street, 16th Street and the other side streets thereabout?

A. It is a little broader.

Q. Now it appears that this Block 991, Lots 1 to 47, which
2840 you have testified to be worth $177,435.52 were assessed at a
larger sum for taxation, to wit, $180,000, and that as we have seen practically all the property on page two of Exhibit 48, to which you have testified has been assessed for taxation for a higher figure than you have given as the present value. Does that circumstance, considered as a whole, affect your opinion as to the value of this property?

A. It does not, sir.

Q. Are these slips as to valuations, or rather slips as to sales and prices obtained for different lots and sections, the same ones as Mr. Thompson had here?

A. The same ones. We got them up together; some of them belong to me and some to him.

Q. Well, there have been no additions made since he testified, I suppose, to these sales included in those little books?

A. Not since to-day.

Q. Then I do not think I will need to ask you about that, as I questioned him quite fully.

A. Yes.

Q. Referring to the 18th Street property, between 16th and 20th

Street West, the marginal street and 10th Avenue, your figures appear to be identical with those presented by Mr. Thompson?

A. Except——

Q. Were you not retained by the City for the purpose of appraising this particular property or testifying in regard to it in connection with the 18th Street improvements?

A. I was not.

Q. Did you testify in that regard for the City?

A. I did not.

Q. Referring to Block 715 on the south side of 18th Street, east of 10th Avenue, what buildings did you find there. You said you did not find any that you included as adding to the value of the land?

A. No, there is an old 2-story building that was on there and I did not think it added anything to the value of the land.

Q. Do you know what that was used for?

A. Used in connection with the Gas Company.

2841 Q. You don't know for what purpose?

A. No, sir; I do not. I did not really examine the building, for I did not think it was an adequate improvement and therefore did not add anything to the market value of the land.

Mr. Burr: Mr. Thompson said it was a stable. You don't know whether it was a stable?

The Witness: I do not. I think it was a stable for storage; they used it for storage of different things in connection with the gas plant.

Q. Did you make any estimate of the value of the land west of 10th Avenue, between 16th and 20th Streets, belonging to the Consolidated Gas Company as they stood, before the improvement took place?

A. I did not; no, sir.

Q. You have only appraised what is left?

A. I simply appraised what I found to be on that Exhibit 48.

Q. Now, your valuations for these parcels appear to be identical with Mr. Thompson's, with one or two exceptions.

A. Yes, there are several exceptions.

Q. One is——

A. I think there are eight or ten that we did not agree on.

Q. No, I say this particular parcel.

A. I beg pardon.

Q. I refer to the 18th Street property, so-called, on North River. I think you agree in every respect so far as that is concerned?

A. We do; yes, sir.

Q. In reference to the properties between 19th Street East and 22d Street East and First Avenue and the marginal street, you also agree in most cases, and I will call your attention to those cases in which you do not. The first is Block 952, where you give a valuation of $350,200 as against $333,520 by Mr. Thompson. 2842

Q. Will you give the detail by which you reached your total?

A. I have put in the corner lots on the avenue at $12,000 each, which would be $24,000; the 2 adjoining the corner $20,000, $10,000 each; 4 inside lots at $9,000 each, $36,000; 32 lots at $7,500 each, $240,000; 34 front feet—I have made a mistake there. Well, the remaining land was $10,200 or a total for the land of $330,200. Now, for the buildings I have added $20,000, making a total of the land and buildings of $350,200.

Q. How much does that make for the street lots, interior?

A. $7,500.

Q. The same on 21st Street as on 20th Street?

A. About the same; in my opinion there is no difference.

Q. Is not the property more valuable the nearer you get to 23d Street, generally speaking?

A. I don't think 23d Street has any bearing below the north side of 22d Street; in other words the property abutting 23d Street.

Q. Will you take Block 979 which you have estimated at $401,963 as against $338,086, and give me the details of your valuation?

A.—

I have taken the two corner lots at $12,500 each......	$25,000.00
Two lots adjoining the corner $9,000 each..........	18,000.00
Four inside lots at $3.50 a square foot.............	35,000.00
Forty-second Street lots at $7,000 would be..........	294,000.00
There are two gores on the marginal streets 7,885 square feet at $3.80.........................	29,963.00
Or a total of............................	$401,963.00

There is a 1-story gas building covering the plot.

2843 Q. You did not add anything to your valuation for this building?

A. I did not.

Q. Take the next block if you please, 978, which you valued at $411,264 against $326,518.60 as given by Mr. Thompson.

Q. Will you give the details of your valuation there?

A.—

Northeast corner of Avenue A.....................	$12,000.00
Lot adjoining the corner.........................	10,000.00
One inside lot—the Company does not own the whole front there and I have divided them up into lots or had my surveyors do it. There are 1,900 square feet at $3.60, which would be......................	6,840.00
The next would be 529 square feet in the rear of the portion that is not owned by the Company, at $3.60, which would be	1,904.40
Two inside lots 2,100 square feet each, or 4,200 square feet at $3.60 a square foot....................	15,120.00
Lot adjoining the corner of 21st Street, at $4 a square foot	10,000.00
Southeast corner of Avenue A and 21st Street........	12,000.00
Two corner lots $11,000 each.....................	22,000.00
Two lots adjoining the corner $8,000 each..........	16,000.00

Four inside lots or 8,400 square feet at $2.60 a foot would be	23,520.00
Then I have 37 1-5 street lots at $7,000 a lot	260,400.00
Or a total of	$389,264.00

Now there are some buildings on that property. There is No. 326, which is on the corner, 326 Avenue A, which is a 4-story 2844 tenement, stores and basement vacant; that is the stores were vacant, and I think one or two floors upstairs were occupied, and which would add in my opinion about $4,000. 328 and 330, two five-story buildings occupied by men employed in the Gas Company, and in my opinion they add about $4,000 each, or $8,000 for the two or $12,000 for the buildings, making a total for the whole property of $411,264.

Q. What is the frontage of these three tenement houses which you valued at $4,000 each?

A. I think they are full lots.

Q. Is either of them a corner?

A. One of them was, 326 was on the corner.

Q. Is not that worth more than the two interior lots?

A. I don't think the building is worth any more.

Q. Five-story tenement?

A. This was a four-story tenement on the corner. The inside ones are five-story, but in my opinion the value of the buildings is about the same.

Q. That would be $4,000 a piece for the five-story tenements?

A. Yes, sir. They are old buildings which have been build there for thirty years from my own knowledge, and I don't know how much longer.

Q. I assume it cost more than that to construct them originally a great deal.

A. Yes, a great deal more to construct them at the time they were constructed, also now. But they were an adequate improvement at that time and now they are not.

Q. And again you take merely what they would add to the value of the land if a purchaser came along for the land?

A. Precisely.

Q. Now, referring to this property in general, between East 19th Street and East 22d Street and east of First Avenue, it appears that Block 951, while you have given a land value of $49,000 is as- 2845 sessed at $50,000; Block 952, for which you have given a land value of $330,200, is assessed at $340,000 for taxation; Block 953, which you have valued at $403,000, is assessed for taxation at $500,000, and that Block No. 987, which you have testified is worth $83,876.96, is assessed for taxation at $86,000. Would not the fact that each one of these is assessed for more than your figures, and the fact that they are grouped together here as they are, indicate to you that you had undervalued them in your estimate?

A. It would not, sir.

Q. I call your attention to another circumstance, that is to say, that what is known as the 14th Street property, that is, between 14th

Street and 16th Street east, respecting which you have testified, and this property between 19th and 22d Streets east, that is to say practically all the property on the east side, you have placed at a lower figure than it seems to appear on the books of assessments for taxation. Would not that indicate to you that you have undervalued the property of the east side?

A. I really don't know what the assessment is, Mr. Mathewson.

Q. Well, it is in evidence——

A. But the figures I have testified to is what in my opinion the property is worth to-day.

Q. Well, I am simply calling your attention to the fact which appeared in evidence and ask, those being the facts as to the assessments for taxation, and the difference appearing to be largely on the east side, if that would not induce you to think that perhaps you had made a mistake in your valuations and put the valuation too low in this section.

A. It would not have the slightest effect, sir.

Q. What do you figure a lot in Block 1089, being the block between 42d and 41st Streets and west on Eleventh Avenue to be worth, facing on 42d Street, interior?

A. $11,000 each, situated where that is, between Eleventh and Twelfth Avenues.

2846 Q. You valued it as worth $11,000 assuming that Twelfth Avenue belonged to the city, to begin with?

A. No, sir; I did not.

Q. Did you not assume it at first as worth $11,000?

A. Yes, sir. I have made no difference.

Q. If Twelfth Avenue belonged to the city, there would be a corner lot at 42d Street and Twelfth Avenue, which you would have to consider. It would not be an interior lot?

A. No, it would not, if that was a fact, but Twelfth Avenue is not there at the present time and it is a question in my mind whether it would or would not, and I took the property just as I found it.

Q. Yes, but if you did not take the property as you found it for that purpose, but you assumed that Twelfth Avenue belonged to the city, and I assume, would be used by the city, then would not the lot at the corner of Twelfth Avenue which you assumed, and 42d Street be valued as a corner lot in any abstract, instead of an interior lot?

A. It would make some difference, Mr. Mathewson.

Q. Then if Twelfth Avenue does not belong to the city, you would have lots on the bulkhead and would not they be worth more than interior lots?

A. If they were not separated from the uplands, yes, but if Twelfth Avenue was cut through they would be——

Q. But I have asked a question, assuming that Twelfth Avenue was cut through, and you said it would be a corner lot. Now, I make the assumption that it is not cut through, that is, that the street belongs to the company. In that event the company would have lots on the bulkheads adjacent to its upland; and would not those lots be worth more than interior lots?

A. I do not think so.

Q. You don't think bulkheads are worth the same as interior lots, do you?

A. I don't think—it would only be used for one purpose, 2847 for unloading canal boats, etc. The piers might be worth more, but in my opinion the upland would not be worth more.

Q. Then your proposition is that lots on a bulkhead are worth no more per foot than lots on the interior of a block?

A. I say the bulkhead itself would be, but in my opinion the land here would not be (indicating).

Mr. Burr: Where do you mean by "here?"
The Witness: Twelfth Avenue adjoining the bulkhead.

Q. Not even the lot immediately adjacent to the bulkhead?

A. Possibly the one adjacent to it, possibly might be, but you would have to have a marginal street there in order to use your bulkhead and the lot adjoining that lot might possibly be worth a little more than one possibly fifty feet back.

Q. Why would it be necessary to have a marginal street there to use the bulkhead?

A. I think it would be to the advantage of the property; in other words, you would want to have access to the bulkhead.

Q. But if you owned the land right up to the bulkhead, which is the assumption upon which I am going, you need no marginal street to get to it?

A. Yes, but I don't think the particular location is adapted for that. I think it is too valuable for that. You could only use it for a factory or something of that sort if you utilized it, and the bulkhead would be only useful as a factory.

Q. You know it is being used right to the bulkhead by the Gas Company in connection with their business?

A. Yes, I admit it is very valuable to them in connection with the whole block.

Q. And is it not a fact that the location of this whole block, and with the pier extending out on the bulkhead, in respect to 2848 which you have not testified, gives a peculiar value to the Gas Company for its business?

A. I do not think so. I have assumed, Mr. Mathewson, that the city will cut Twelfth Avenue through; in other words, I have every reason to believe they will. They are building a sea wall now in a case I testified in between 42d and 43d Streets.

Q. I am assuming that the company owns up to the bulkhead line and of course I am assuming that the city if it does take the property, will have to pay whatever it is worth and I am trying to get at its value. My question, therefore, is directed to this point. Assuming that the company retains this property up to the bulkhead line, in connection with the pier, does it not make it a part-cularly valuable piece of property for the uses of the company.

A. I think it would for the purpose of manufacturing gas, but I have not assumed anything of the sort, knowing the fact that the city is going to cut through Twelfth Avenue and that I knew different.

Q. Well, if they did cut through Twelfth Avenue and the property in the street belonged to the company, you would assume that they would pay the company whatever under proper judicial proceedings would be found to be the value of the property?

A. In my opinion the city always pays what property is worth.

Q. I understand you have no more data here in reference to sales of individual lots in regard to any of this property regarding which you have been examined than Mr. Thompson had when he testified?

A. No, sir. We had those sales made up to date, and I have nothing new, that is, I have nothing new since Mr. Thompson testified.

Q. Taking Block No. 1092, between 44th and 45th Street- and west of Eleventh Avenue, you have included in your total of $431,-000, $4,500 for buildings?

A. Yes, $4,500 for buildings.

2849 Q. Will you describe the buildings which you have allowed at that amount?

A. The buildings were 606, 608 and 610 West 45th Street. One of them was 16 feet 8 inches by 45 feet, three-story brick with one-story extension. No. 606 was a small tenement house; in fact, they were three small tenement houses.

Q. Were they all the same width?

A. No.

Q. Give them to me.

A. One was 20 by 45; in fact, two of them were. There was only one 16 feet 8 inches by 45 feet.

Q. The others were 20 feet by 45 feet?

A. Yes, sir.

Q. Were they all five-stories?

A. Four-stories I have them.

Q. All four-stories?

A. Yes, sir.

Q. Did the yard extend to the centre line of the block?

A. It did.

Q. And three you have valued at $4,500 or an average of $1,500 apiece?

A. $1,500 apiece. In my opinion that is what they added to the market value of the land.

Q. You do not mean that that is what they originally cost I assume?

A. They cost a great deal more than that.

Q. Now, what do you give as the value of an interior lot on 44th Street and a lot on 45th Street and a lot on 46th Street, referring to Blocks 1092 and 1903, between 44th and 46th Street-, west of Eleventh Avenue?

A. In my opinion on 44th Street the land is worth $8,000; on 45th Street, $7,500; in my opinion it is worth a little more on 44th Street than it is on 45th Street on account of the gas.

Q. How much on 46th Street?

A. About $8,000.

Q. In adding to your estimate for these two blocks, made on the assumption that the city owns Twelfth Avenue, in order to get the

total which would result if the company owned Twelfth Avenue, you have simply taken the width of Twelfth Avenue and
2850 divided that into lots and taken as the value of each lot, the value of an inside lot, have you not?

A. Exactly what I did.

Q. Exactly the same as you did at 42d Street?

A. I did. I used the same method.

Q. And similarly, if Twelfth Avenue is to be cut through, you then would have corner lots instead of inside lots at the corners of these several streets and Twelfth Avenue?

A. You would.

Q. And your reply also would apply, I suppose, as to the lot, next the bulkhead lot if the Company owned Twelfth Avenue?

A. It would.

Q. If then a revision of figures was to be made on those theories, it would add somewhat to the figures you have given?

A. It would make a slight difference, sir, in favor of the Gas Company.

Q. Will you refer on page 8 of Exhibit 48 to Block 1156 which you have valued at $40,000 for four city lots, in which amount you have included $8,000 for buildings, and describe the buildings.

A. That is situated on the south side of 65th Street. This was a four-story building, occupied by men employed by the Gas Company, in very fair condition, and in my opinion has added about $8,000 to the market value of the land.

Q. Does this building cover the entire 100 feet front on 65th Street?

A. No, sir, it is only twenty-five feet, the remainder is vacant, seventy-five feet is vacant.

Q. Is that a five-story building, did you say?

A. Four-story.

Q. Now on page 10 of Exhibit 48, Block 1704, which you have estimated at $281,584 contains some brick buildings and frame structures for which I understand you have included nothing.

A. I have not, no, sir.

Q. They are used by the Company in its business?

A. They are.

Q. And do you think they would add nothing to the land
2851 if the land was sold.

A. In my opinion they would not.

Q. Does it modify your opinion that that block is assessed for $285,000 for land only, or more than your estimate?

A. It would not affect my opinion any whatever.

Q. What is the provision for plottage that you make, Mr. McHale, in considering the values of these large parcels belonging to the Consolidated Gas Company?

A. In my opinion, of course I valued them just as I found them as a large parcel. In my opinion an individual lot would not sell within ten per cent. to five per cent. of what I valued those at.

Q. Did you find the valuation of an individual lot, and then determine from that, the value of the entire parcel of lots if sold in small plots, and then add a certain percentage to those figures to represent plottage?

A. In some cases I did and in other cases it was a question of judgment. In a great many cases there had been really no transactions.

Q. In which of the blocks did you pursue the method I have indicated, that is to say, taking the value of individual lots and ascertaining the full values of the parcel by multiplication and then adding to that value a certain percentage for plottage?

A. I think I really did in the most of them.

Q. Have you the details showing the percentage that you added each time in such cases?

A. That I had in mind they added in the neighborhood of five to ten per cent. and in some places more than that.

Q. You do not catch my question. Have you the details here showing that?

A. No, I have not.

Q. Then you are unable to state what details you employed in each individual instance to reach a valuation upon which you added the percentage for plottage?

A. No, I do not state anything of the sort.

2852 Q. Well?

A. I state just the reverse, that I compared sales very carefully, compared sales wherever I could find them.

Q. I don't think you have followed me. I asked you whether you have for any block here a statement of the estimate which you made of the value of individual lots and indicating that you multiplied that by the number of lots in a plot and reached a valuation upon which valuation you added five or ten per cent. as plottage value to reach your total, whether you have such detail here in reference to any block?

A. No, sir, I have not.

Q. Now Mr. Thompson testified that that was not the method which he pursued and that what he did was to take the plottage and add it to individual lots at the outset, instead of adding to the valuation of the block, which he got by taking individual lots and multiplying. How do you account for the fact that you and he reached in most instances the identical figure to a cent?

A. In some cases we did agree exactly as to the value of the land.

Q. What puzzles me is how you could have reached exactly the same value to a cent by taking an entirely different method of computation.

A. I think it is an easy matter, I think it is a very easy matter.

Q. Then if Mr. Thompson took individual lots and added plottage to individual lots, and then multiplied those lots by the number in order to reach the total value of a block, he pursued a different method from the one which you indicated a few moments ago as pursued by you.

A. He has his own methods, I assume.

Q. And just how you came to come out identical as to figures in most of these blocks you cannot explain other than you have?

A. Not other than I have. I don't think it requires any explanation.

2853 Mr. BURR: Have you in mind where that testimony of Mr. Thompson appears to which you refer?

Mr. MATHEWSON: I cannot, but I think it was this morning. I think I have quoted with substantial accuracy.

Mr. BURR: I have no doubt of it, but I wanted to refer to the exact language he used.

Q. When were you retained by the City to testify in this proceeding?

Mr. BURR: Objected to as incompetent, irrelevant and immaterial.

The MASTER: Objection overruled.

Mr. BURR: Exception.

A. Some time ago, I really could not tell you.

Q. Well, I do not mean the day, but was it a month ago or a week or how long ago about?

A. I think about two weeks ago, but I have been appraising this property for three years.

Q. Well, when you made these two appraisals you said you made them for the Consolidated Gas Company. Were you retained by the Consolidated Gas Company at that time?

A. At the time that I——

Q. Made the appraisals to which you refer, the first two, or the examinations of the real estate?

A. I don't know whether I am retained or whether I am not.

Q. Were you retained by the Consolidated Gas Company, and was it in connection with that retainer that you made the examination of their property two years ago with Mr. Thompson?

A. Do you mean for Shearman & Sterling?

Q. Yes.

A. Yes.

Q. You understood that Shearman & Sterling were acting for the Consolidated Gas Company?

A. I did, yes, sir.

2854 Mr. BURR: I object to this testimony and I objected to the same line this morning. I don't know what the object is. If it is to discredit them, as you suggested this morning, if they are going to prove there is a bias or a quarrel of prejudice existing, that is one thing; but if it is merely for the purpose of spreading upon the records that they have at some time, two or three years ago, appeared for the Consolidated Gas Company as experts, I cannot see what materiality it has here. It is already in evidence as to the fact.

The MASTER: I think it is proper to show the relation of these gentlemen to the property, and what they have done about it.

The WITNESS: I have got the kindest feelings towards Shearman & Sterling, and I wrote them a letter, not to pay my bill until they got ready.

Q. Were you not retained by them prior to these examinations of the real estate?

A. I was retained by them some time about three years ago.

Q. And in that connection you made these examinations of the property to which you have referred?

A. In most of them. Some were not included in that case.

Q. But most of it was included respecting which you have testified?

A. I think 90 per cent. was.

Q. And you conferred with Mr. Thompson and Mr. Thompson and you dealt with Shearman & Sterling, and were you not retained for the examination, appraisement and testimony respecting these different parcels in *certiorari* proceedings begun by the Company against the City of New York to reduce the tax valuation.

A. In most of them we were.

Q. And in some of them you have testified?

A. I have testified really in most of them. I think I have 2855 testified in all of them with the exception of one.

Q. Are there not about 50 per cent. of them at least where you have not testified?

A. No, sir, I have testified in every case where I was retained with the exception of that little property up at Sherman Avenue and Kingsbridge, and 132d and 133d Street. In the rest of them I have testified in every one.

Q. Were you not retained in respect to the same parcels Mr. Thompson was?

A. I think I was.

Q. Mr. Thompson testified this morning or this afternoon that he thought perhaps 50 per cent. he had not testified in?

A. I have testified in a great many that Mr. Thompson has not testified in at all. Mr. Thompson I don't think has testified in any of the sixty's, that is on the west side property. I don't think he has testified on any of the west side property.

Q. Do you know whether any of these proceedings in which you have been retained has yet been concluded?

A. I have not the slightest idea, but I have every reason to believe they are not.

Q. Did you confer with Shearman & Sterling and the Consolidated Gas Company before accepting the retainer, with reference to accepting the retainer for the valuation of this same property in this proceeding for the city?

A. I have not had a conference with Shearman & Sterling, I don't think, for a year or a year and a half. The last communication I had I wrote them telling them when they got ready to pay my bill, to pay it, but did not ask them to pay it until it was settled.

Q. Haven't you testified on valuations of land in cases where you have been retained by them and have not yet testified?

A. And have not yet testified?

Q. Yes, in the *certiorari* proceedings?

2856 A. Those two I spoke of and the one up at Kingsbridge and 133d and 132d Streets. All the others I have testified in.

Q. You are under retainer then to the Consolidated Gas Company with reference to those parcels at present, not having testified?

A. I don't know whether you can call it a retainer or not.

Q. Didn't you receive certain money on account?

A. I did, with the understanding that the cases were to be pushed, that the cases were to be tried.

Mr. BURR: I think this is gone far enough. I think this is entirely immaterial and irrelevant, because the proceedings in which these gentlemen testified are matters of public record and they could bring the record here to show what they testified.

Mr. MATHEWSON: I have nothing further, therefore there is nothing to object to, as far as I know.

At 4.45 an adjournment was taken until Friday October 12th, 1906, at 11 a. m.

Last Exhibits:

Complainant's, 256.
State's, W.
City's, 54.

2857 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *Friday, October 12th,* 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Meade, Mr. Burr.

2858 MARTIN MCHALE resumes the stand.

Cross-examination (continued):

By Mr. MATHEWSON:

Q. Suppose the Consolidated Gas Company were to sell all its property at 42d Street, its real estate, and were to announce before making such sale that the manufacturing plant was to be discontinued and disposed of there, what effect would that have on the value of the land or the selling price of the land?

A. Why, I think it would sell for considerably more, particularly so 42d Street.

Q. As a matter of fact, it would have the same effect, differing only in degree, in the case of any of its plants, wouldn't it?

Mr. BURR: I object to that line of examination. The question is here what was the valuation of this property at the time this law which is said to be confiscatory went into effect.

Mr. Mathewson: The witness is giving the amount for which it will sell. If we sold our plant at 42d Street that very element of sale is involved; and it would be sold, under ordinary circumstances, of course, not for a gas plant, but for improvements in other directions; and the very fact we sold it would increase its value above the value of surrounding property to-day.

Mr. Burr: I press my objection, because there is nothing to show what would be the conditions existing subsequent to the present when they might make up their mind to sell or remove their plant. The existing situation at that time or what the valuation of the property at that time might be is purely speculative. The question 2859 is, what is the value of this property now, and what was the value when the law went into effect as against this company.

Mr. Mathewson: You and Senator Page asked precisely the same question on cross-examination of our witnesses; what would be the effect on the sale of this property if they were sold and the plants discontinued?

Mr. Burr: You asked that question on direct, and we had the privilege of cross-examination.

Mr. Mathewson: No, I did not.

Mr. Burr: I object to it as incompetent and immaterial. We might indulge in speculation along this line *ad nauseam,* but it would have no bearing on the issues in this case, it seems to me.

Mr. Mathewson: You say it is the selling value. I am finding out what the effect would be as related to the figures given by this witness if all the blocks, for instance, in any particular locality, should be sold.

The Master: I think it is a fair question on cross-examination, in view of the testimony that has been given, to ask the witness on various hypotheses and test his views as to the value of the property. At the same time I think there is considerable force in your objection, Mr. Burr. If the question is as to what amount of capital is fairly locked up and employed in real estate by the Consolidated Gas Company for the purposes of their business, it may not be very material to get at the value of the real estate under conditions which entirely negative their doing business. That I apprehend to be the force of your objection?

Mr. Burr: Yes, sir.

2860 The Master: But I will allow it. I think it is proper under the circumstances, and will give you an exception.

A. I think if your gas plant was removed entirely from 42d and 41st Streets it would have a very decided effect upon values there.

Q. And the values which could be obtained for the lands of the Consolidated Gas Company, if it were announced that all the lands would be sold for purposes of other improvement, would be considerably increased in that event, would they not?

A. In my opinion, sir, they would.

Q. And would not that be true in all the other localities in which the company has plants, in greater or less degree?

A. If they were all removed, it would, yes, sir. It would apply to them all possibly.

Mr. BURR: When you say "plants" do you mean plants and holders all removed?

Mr. MATHEWSON: Manufacturing plants. The objectionable part of a gas plant is the manufacturing plant, isn't it?

The WITNESS: That is what I assumed to be the case.

Mr. MATHEWSON: Holders are not such a serious proposition.

Mr. BURR: You do not claim they are not objectionable?

Mr. MATHEWSON: They are not so very objectionable. There are holders in some very good localities. It is the fumes and noise and dirt from manufacturing which are particularly objectionable.

Redirect examination by Mr. BURR:

2861 Q. Now, what might occur by that possibility of the Consolidated Gas Company taking away all its manufacturing plants is merely speculative on your part, is it not?

A. Entirely so, sir.

Q. You have no way of gauging any opinion upon that by conditions that might exist in the future?

A. Not the slightest; it is purely speculative.

Q. You have been asked several times as to whether the assessed valuation which was stated in certain figures by Mr. Mathewson as having been given in the testimony here affected your valuation in any way and you answered no. Now will you say what reason there exists for the failure of that assessed valuation to affect your valuations as you have given them here?

A. Why, an assessor is human, the same as I am, and he is liable to make a mistake the same as I have often done. I never pay any attention to assessed valuations in valuing property. I familiarize myself with sales, leases and everything pertaining to real estate and have an idea of my own as to what the property would sell for, irrespective of any assessed valuation. I have known several cases where, in my opinion, the property has been assessed fifty per cent. or seventy-five per cent. more than it would really sell for.

Q. As a matter of fact, in these proceedings wherein you were retained by the Consolidated Gas Company, your services were called into operation to show that the assessed valuations were not the proper valuations in your judgment, that they were excessive?

A. I was called in consultation in regard to these cases and several others. In some cases in question we advised *certiorari;* I think in quite a number we advised to discontinue those particular cases in question. With the exception of a very few, in my opinion, for the year 1903 they were assessed entirely too high.

2862 Q. The testimony taken in these *certiorari* proceedings is a matter of public record, is it not—I mean your testimony?

A. I suppose it is, sir.

Mr. BURR: And I do not think it will be claimed that the City of New York has not a copy of that testimony?

Mr. MATHEWSON: I do not think it is of the slightest importance. I place no weight on that suggestion.

Q. Were the valuations which you gave in this proceeding on behalf of the Consolidated Gas Company honest and fair valuations according to the best of your judgment and opinion?

Mr. MATHEWSON: I do not know that that is very material.
The MASTER: I will allow it.

A. They were, sir.

Q. Does that apply to the values given by you here?

A. The values I have given here are very much above the ones for 1903, and it is the very best of my opinion, my judgment.

Q. That is, the valuations that you gave here were the same valuations that you gave for the Consolidated Gas Company, with the addition of an appreciation which has accrued since, in your opinion?

A. With the appreciation which has accrued since 1903.

Q. So in every case that you have testified here your valuation is higher than the valuation given by you when you were testifying for the Consolidated Gas Company?

A. In some cases fifty per cent. higher.

Q. And *I* say that the testimony you have given here in this proceeding as to the values was the result of your honest judgment and opinion?

2863 Mr. MATHEWSON: He has so testified. Once yesterday and once to-day.

A. It is, yes, sir.

Recross-examination by Mr. MATHEWSON:

Q. You testified that the figures that you have given are the amounts for which, under ordinary circumstances, you believe the real estate would sell for?

A. I have.

Q. Now if the company sold some of its land at 42d Street, wasn't it your assumption that it would sell it for some other purpose than a gas plant?

A. If they did sell it, I assume that they would sell it for some other purpose than manufacturing gas, yes, sir, otherwise it would not increase——

Q. Then, what you did mean by saying a moment ago that it would be a matter of pure speculation to give the value that the land would sell for if sold for some other purpose?

A. It is impossible to give an idea of what it might sell for. It might sell for fifty per cent. more or one hundred per cent. more, I couldn't tell. It is a matter purely of speculation.

Q. Have you not, in making the estimate of the price at which this land would sell, having it in mind as you had that if sold it would be sold for some other purpose than manufacturing gas, tried to determine what effect that would have on the value if it were sold for other purposes?

A. I appraised the property for what it would sell for to-day.

Q. For what purpose?

A. Any purpose. I am not supposed to know the purpose. I did not take that into consideration.

Q. But, if sold for some other purpose than manufacturing 2864 gas, would it not involve the elimination of the gas manufacturing nuisance from that section?

A. It might be sold for a factory that would be more of a nuisance than a gas plant, as far as that is concerned.

Q. You assumed it would be sold for some purpose that would be at least as much of a nuisance as a gas plant, did you?

A. I valued the property as I found it. I did not take into consideration what it would be used for afterwards, and I don't know what it would be used for. I appraised it just as I found it to exist now in the city.

Q. But you have stated if it would be sold for some other purpose than a gas manufacturing plant, and that purpose would be less of a nuisance than a gas manufacturing plant, that the figures which you have given here would necessarily be increased more or less?

A. But how much, sir, I could not say.

By Mr. Burr:

Q. Has there been an increase in the valuation of this property and other property in the City of New York since the 1st of July, 1905?

A. Since the 1st of July, 1905?

Q. Yes.

A. Oh, there may be a slight increase. There has been a decided increase since 1903. In 1903 real estate was very low. There was quite a depression in the financial section, consequently it affected real estate, particularly so high-priced real estate. In fact, it did up to 1904, August, 1904. Since August, 1904, or July, 1904, I might say, to 1906, I think there has been a decided increase all over the City of New York.

Q. What would you say, in your opinion, has been the increase during the past twelve months in property, this property especially.

Mr. Mathewson: Which property?

2865 Mr. Burr: The property he has been testifying regarding.

A. Most of it is taken between 1904 and 1905, I should say, perhaps in the neighborhood of five per cent. of it might be; I don't think it would exceed that.

By Mr. Mathewson:

Q. That would be on the average to all the land?

A. I should say certain sections, of course. The big boom was in 1905, as low as 98th Street on the East side, and on the West side in 65th Street and through that section there has been a decided increase there; also in 132d Street, on the West side, there has been a big increase in land up there since the Subway was opened.

By Mr. Burr:

Q. But on the whole, with regard to this property, you would say on the average there has been an increase in the past twelve months, or since the first of July, of about five per cent.?

A. I should say so, sir.

Direct examination by Mr. **Burr**:

Q. Now, have you made water front property in the city of New York a study, and, if so, for how long?

A. About twenty years.

Q. Are you familiar with the sales and leases of piers and bulkhead property in the city of New York on the North and East Rivers?

A. I am, sir.

Q. Please state what pier and bulkhead property you have appraised in the city of New York in the last ten years, also for whom you have appraised?

A. I have appraised the Brooklyn Wharf and Warehouse property twice—I might say three times—I have appraised—I will take on the other side first, then come back on the East River, if you have no objections. I have appraised the ferry property, Williamsburg Ferry, the Greenpoint Ferry, and also on the East River Pier 9, Pier 10, Pier 11, Pier 13, Piers 18, 19, 20, with all the bulkheads; Pier 36, Pier 35, water front between 8th and 9th Street, with the land under water, which I have for sale; also the land under water with upland, bulkhead, between 4th and 5th Streets on the East River, between 18th and 19th Streets, 19th and 20th, 28th and 29th, 36th to 37th, 44th to 46th. On the North River I have appraised 42d to 43d Streets, bulkhead and land under water; I have appraised from 44th to 46th Streets on the North River, from 46th Street to 48th Street on the North River, 121st to 152d Street on the North River; and my clients have been the City of New York, Brooklyn Wharf and Warehouse Company, Title Insurance Company, New York Dock Company, United States Mortgage & Trust Company. There were other piers and bulkheads that I have been connected with more or less, but I do not just recall them.

2867 Q. Now, have you examined the water front bulkhead property of the Consolidated Gas Company as the same appears upon Exhibit 48 in this case?

A. I have.

Mr. **Mathewson**: I wish to make an objection here that the witness, not having bought and sold bulkhead property, is not qualified to testify on this subject. He has not been shown to be qualified within the rules of law.

The **Master**: I will overrule that objection, Mr. Mathewson. I think it is well understood that transactions in bulkhead property in the way of sales are so infrequent that no man in the city of New York can really claim to be called a specialist in that line and have that as any considerable amount of his business; but I think any real estate man of experience in New York is customarily permitted to express his opinion on bulkhead property. I took that view in the case of Mr. Wheelock when he was objected to, and I take the same view here.

Mr. Burr: Mr. Wheelock had no such experience as this gentleman has had.

Objection overruled. Exception.

Q. Have there been sufficient sales of bulkhead or pier property within the past few years which, in your opinion, would make a fair criterion as to values?

A. In my opinion there is not, neither on the North nor the East River.

Q. Now, in your opinion has water front property increased or decreased in the past few years?

A. In my opinion it has increased, sir. That is, I think piers have, shedded piers. I think piers have increased more than bulkheads have.

Q. Now, we will take up the bulkhead property or water front property of the Consolidated Gas Company, if you please.
2868 Which piece did you examine first?

A. I have got between 14th and 16th Street here as the first.

Q. That is the bulkhead property on Tompkins Street?

A. Yes, sir, situated between 14th and 15th Streets.

Q. Appearing on page 2 of this Exhibit. Now will you describe that property and tell us all you know about it and give us your estimate as to the value of it?

A. There are about 30,318 square feet; in other words, 450 by 70 feet, equal to 30,318 square feet, in my opinion, worth about $2 a square foot, or $60,636. There are 446 feet, 4 inches of bulkhead at $200 a foot, which would be $89,480, or a total for the property of $150,116.

Q. Now take the next property.

A. I have taken the next, between 41st and 42d Streets.

Q. That is the bulkhead property appearing on page 5 of the Exhibit?

A. Yes, sir.

Q. 41st and 42d Streets. Now will you please describe that property and tell us what your valuation of it is?

A. There are 197 feet and 6 inches of bulkhead, at $250 a foot, would be $49,375. Now the pier rights, I have taken your exhibits assuming they were correct, I have assumed you could erect a pier there 60 by 700 feet, running out to the pier head line established by the Secretary of War in 1900.

Mr. Mathewson: You said you had 197 feet 6 inches, at how much a foot?

A. 197 feet and 6 inches at $250 a foot equals $49,375.

Q. Continue in regard to the 41st Street property.

A. I assume pier rights 60 by 700 feet equal to 42,000 square feet. In my opinion the pier rights ought to be worth $6 a foot or $252,000.

Q. That is larger than the complainant's witnesses have given?

A. Yes.

2869 Q. The next parcel of bulkhead property is between 44th and 45th Streets?

A. Yes, sir. Land under water.

Q. That is known as Block 1107, Lot No. 23. Proceed.

A. Between 44th and 45th Streets, land under water. 70 feet by 200 feet 10 inches, or about 14,756.10 square feet, in my opinion worth $2 a foot, or $29,512.20. Between 45th and 46th Streets the same number of square feet, 14,756.10, at $2 a foot, $29,512.20, or a total of the land under water of $59,024.40. The bulkhead between 44th and 45th Streets, 200.83 feet, at $200 a foot, would be $40,166. Between 45th and 46th Streets, the same number of feet, at $200 a foot, $40,166, or a total of $80,332 for the bulkheads, or a total for the land under water and bulkhead of $139,356.40.

Q. The next parcel is on Pleasant Avenue?

A. Pleasant Avenue, situated between 110th and 111th Streets. Land under water about 9,400 square feet, in my opinion worth about $1 a square foot, would be $9,400. There are 212 feet of bulkhead, at $100 a foot, would be $21,200, or a total of $30,600. Now I have inspected Shadyside. I do not think that has any number.

Mr. Mathewson: Is that all the bulkhead property?

The Witness: I think it is. 14th to 16th Streets, 110th to 111th Streets, 44th to 45th Streets.

Mr. Mathewson: Did you not appraise the West 16th, 17th and 18th Streets, which the city has taken?

The Witness: No, I did not. Now, Shadyside property situated on the Jersey side of the Hudson River——

Mr. Mathewson: May I ask a question as to his qualifications to appraise a Jersey property? 2870

Mr. Burr: Of course.

Q. Have you bought and sold any property in Jersey in the vicinity of Shadyside?

A. The nearest, sir, is West Hoboken. I have bought and sold—in other words, I bought it and sold as quick as I could.

Q. How long ago was that?

A. About five or six years ago.

Q. How much, not in money, but in area?

A. One piece of property.

Q. This Shadyside property is on the water, is it not?

A. It is on the water down underneath the cliff.

Q. And a railroad running across the rear?

A. Yes, sir.

Q. Have you bought or sold any other Jersey property in that section?

A. Not in that section; no, sir. I have appraised all through there, though.

Mr. Mathewson: I submit the witness is not qualified.

The Master: I will allow it.

Mr. Mathewson: Exception.

By Mr. Burr:

Q. Proceed.

The **Witness**: It contains about 611,700 square feet, or equal to about 245 city lots with water front, and I have taken the property as a whole, as a whole proposition. The property is entirely vacant, with the exception of a pile of coal being on it, with an iron runway from the river up. In my opinion that property is worth in the neighborhood of $45,000 as a whole, or $1,000 a lot. I have not divided that, for the reason that in my opinion they are inseparable, adapted for only one purpose, and in my opinion I would simply give one lump sum. I think the property would sell as a whole for about $1,000 a lot. 2871

Q. Is that all water front property at Shadyside?

A. No, it has a frontage on the water there of about 486 feet, and all this is upland from here back (indicating), but I have treated it practically as water front property for the reason that it is only adapted for factory property, etc., being low ground, and most of the large institutions over there occupy large tracts like that, the Glucose Company occupies next to it there, and——

Q. You mean by institutions, factories of that sort?

A. Yes, and sugar refineries, etc.

Q. Now give the total of the bulkhead property?

A. Including Shadyside?

Q. Yes.

A. $871,447.40.*

Q. Does that include the bulkhead and pier property at Shadyside and land under water?

A. Yes, sir, everything with the exception of the upland which I testified to yesterday, or a total for the land under water, bulkheads, pier rights, Shadyside and upland, $10,689,013.14.

Q. That is the grand total of all of the real estate property of the Consolidated Gas Company?

A. That I have appraised, yes, sir.

Mr. **Burr**: He is your witness, Mr. Mathewson.

Cross-examination by Mr. **Mathewson**:

Q. This excludes all valuation of land at 18th Street which was taken by the city, but which, the testimony is, is still carried by the Consolidated Gas Company as land, in view of the fact that they have not been paid for it yet?

A. I have not included that 18th Street property in my valuation.

2872 Q. Neither the land nor bulkheads nor land under water, nor pier rights, whatever they are, there?

A. None whatever.

Q. Now, in reference to Shadyside, is it not greatly to the advantage of the property, so far as value goes, that it has a water front and that it has a railroad running along the rear?

A. It would not be worth half of it if it did not.

Q. And it is much more valuable for factory purposes than it would be for any other purpose over there in that section?

---

* Should be 886,447.40. See page 2901.

A. In my opinion it is only adapted for factory purposes.

Q. It could not be used for that purpose if it was high land, as some of the land is on the Jersey shore?

A. It is well adapted for factory property, as the other property similarly situated there. Of course, that property is entirely vacant, with the exception of a pile of coal there.

Q. Is property in that section increasing in value?

A. It has increased; in fact, there has been quite a boom there in the last four or five years, but I think it is at about its highest mark.

Q. What percentage of increase would you consider there has been in the last four or five years?

A. I could not answer that. It is impossible for me to say. Further up on the heights there has been a very decided increase, more so than in the factory sites. They have been selling building sites off at almost any price they ask for them along the Palisades, but there has not been such an increase in the last year or so for factory sites over there.

Q. Referring to the bulkheads at East 14th and 15th Streets, and the land under water, I see you have the bulkhead rights valued at $200 a foot?

A. I did, yes, sir.

Q. Are you familiar with the prices established for the bulkhead
rights between 19th and 20th Streets and the East River in
2873 the condemnation proceedings?

A. That is in connection with upland as well, I understand it, Mr. Mathewson.

Q. Well, at Tompkins Street, the company owns all the land, does it not, adjacent to these bulkheads, across Tompkins Street, East 14th and 15th Streets?

A. They do.

Q. And is it not a fact that Tompkins Street at that point is virtually cut off so that the company has the full use of the street between its uplands and the bulkheads?

A. They have free access to it; they have not any monopoly of it any more than anybody else.

Q. No, but from the nature of things, have they not practically free use of that bulkhead?

A. As much as anybody else. Of course, Tompkins is a public street.

Q. Is it not closed above 15th Street?

A. Above 15th Street it is. The hospital runs out there.

Q. So it is not a free street for travel along the river front above that point?

A. It is not what you would call a thoroughfare.

Q. So the company would have relatively much more exclusive rights to this bulkhead line so far as traffic is concerned than they would have if Tompkins Street was not closed at the upper end?

A. I have used 15th Street several times; I have had cargoes of coal come down there to the bulkheads.

Q. But there would not be the same traffic as there would be on West Street, for instance, which is open above and below the pier?

A. That is one of the things that depreciates that property, the fact of Tompkins Street being cut off.

Q. It does not depreciate the value of these bulkhead rights to the Consolidated Gas Company?

A. I don't think it enhances them; that is my opinion, it does not.

2874 Q. Do you know what the price fixed in the condemnation proceedings for the bulkhead rights between 19th and 20th Streets was?

A. I heard of them, but I don't just remember. They took in upland with them.

Q. I refer to the bulkhead rights.

A. That was condemnation proceedings, and I don't always consider those the best criterions of value, for the reason they add the cost.

Q. They were condemnation proceedings by which the defendant, the City of New York, acquired the property?

A. They were.

Q. Is it not your recollection that $300 per foot was obtained for those bulkheads?

A. I have a recollection it was somewheres along there, in the neighborhood of $200 to $300. I think it was $250, although I am not just clear on that. If I remember right, it was $250.

Q. My information is $300, and I do not think I am mistaken, Mr. McHale. Well, take the condemnation proceedings for the bulkhead rights between 20th and 21st Street and the East River. Mr. Wheelock, or Mr. Green, I think, testified that the amount fixed in those condemnation proceedings was $350 per foot for the bulkheads, as against your $200.

A. Yes, sir.

Q. Are you not familiar with that proceeding?

A. I am, I have a record of it.

Q. Is that correct?

A. I think it was $350 that the Commissioners allowed for it, but they also took upland together as well.

Q. Well, you did not mean to say that the $350 covered the upland?

A. No, sir. If I remember right, $350 they allowed for the bulkheads.

Q. Are you quite sure that the land adjacent to these bulkheads belonged to the same owner as the bulkheads?

2875 A. I think they belonged—I know the man that leased them, for I have been down there hundreds of times, H. L. Hurlbut, the coal man, at the foot of 20th Street there.

Q. Do you know of any land under water acquired in the vicinity of East 14th Street at $2 a square foot recently?

A. I have got some for sale at less, in a better location.

Q. Is it around East 14th and 15th Streets?

A. It is between 9th and 10th Streets, which, in my opinion, is worth a great deal more than 14th Street to 15th Street.

Q. I suggest you send a description of it to my clients. They would be glad to see you.

A. I would be very glad to, sir.

Q. Now let us take the bulkhead rights and land under water at West 42d Street. You have given the value of pier rights at $252,000, with which I shall not quarrel. Now let us take the bulkhead at $250 a foot. Do you know of a sale of bulkhead rights between 58th and 59th Streets west?

A. Which sale do you mean? There were two sales; that was sold twice, if I remember right.

Q. Was it not sold once for $650 a foot?

A. No, sir, I haven't any recollection of that.

Q. I think Mr. Wheelock testified to it.

A. There are really so few sales of bulkheads and pier rights that I have not taken them into consideration. In other words, while sales are really the best criterion of value, in bulkhead and water property they are not, because there are so few. In other words, most of the bulkhead property and water rights are owned by different individuals; in some cases I know where there are sixteen different individuals owning the property, where frequently parts of the property are sold, and it does not represent the value of the whole. The best criterion, in my opinion, is what it will rent for in ordinary conditions, capitalized on a certain percentage.

2876 Q. And you found that was the one basis upon which Mr. Greene gave his testimony, did you not, if you have read his testimony?

A. I read his testimony, but I do not agree with him.

Q. Are not the sales of bulkheads one of the best means of determining what the value of those bulkheads are, if you are trying to figure out what their value is in total and not their rental value?

A. No, sir. A steamship company owning a pier may pay four times what a bulkhead is worth in order to control the slip, where an individual could not rent it for more than one-eighth part of what it is worth to the steamship company. You can take any pier from 34th to 59th Streets, and there is not any one of them which is rented on more than a four per cent. basis.

Q. Do you mean to say that these bulkheads are not worth what they would sell for?

A. No, sir, a bulkhead, in my opinon, is not worth very much unless it is connected with the upland.

Q. But if people are willing to pay $650 a foot, is it not worth that amount then?

A. There may be circumstances where they would pay one thousand dollars, but that would not interfere with my opinion.

Mr. Burr: Because there may be some special circumstances?

The Witness: Most decidedly.

Q. I am quite willing you should distinguish if there are any special circumstances, but if the testimony of Mr. Wheelock be correct, that the bulkheads between 58th and 59th Street west sold for $650 a foot, would not that indicate a greater value of bulkheads than $250 per foot at 42d Street?

A. Capitalized on those figures, of course it would.

Q. Are not piers at 42d Street, and are not bulkhead rights
2877 at 42d Street worth more than they are at West 59th Street?

A. Yes, sir; 59th Street there is quite a grade, at least two per cent., in fact, down at 42d Street I think it is worth twenty-five per cent. more.

Q. Mr. Green's testimony was that this was worth $750 at 42d Street. Now, if it be true that at 59th Street bulkheads are worth $650 per foot, they certainly would be worth $750 at 42d Street, would they not?

A. I do not claim so.

Q. Well, if they were worth $650 at 59th Street, would they not be worth $750 at 42d Street?

A. Of course, using those methods, it would, yes.

Q. Are you familiar with the amount established in condemnation proceedings for the bulkhead rights between 51st and 52d Streets and the North River?

A. I was told about it.

Q. And the bulkhead rights are worth more at 42d Street than they would be at 51st and 52d Streets, per foot, are they not?

A. Well, there is not very much difference. You take that whole section, even 59th Street; 59th Street is where the stock yards are. Bulkheads there are valuable for the purpose of unloading cattle, and live stock, etc. And at 52d Street—in my opinion there is very little difference.

Q. Well, aren't you aware that $500 per foot was fixed as the value of the bulkhead rights at 51st and 52d Street- in the condemnation proceedings?

A. I am not responsible for what commissioners do.

Q. I understand that.

A. I think those were the prices that were awarded.

Q. Are you familiar with the stipulation to which Mr. Green testified in reference to the bulkheads at West 11th Street to Gansevoort Street, by which $500 per foot was fixed by stipulation?

A. I have been reading Mr. Green's testimony for years, and am familiar with every word of it.

Q. Are you familiar with that transaction?

A. Yes, I know it to be a fact.

2878 Q. And are you aware of the fact that between 22d and 21st Streets and North River, bulkhead rights were established in condemnation proceedings as worth $900 per foot, which Mr. Green testified was the figure that he gave in that case?

A. I am not aware that the awards are made.

Q. If Mr. Green testified that it had been made at $900, and that was exactly the figure he made, you would not doubt it, would you?

A. I would want to know it to be a matter of fact. I don't think the award has been made, sir; in other words, I have not seen the records.

Q. Well, it has been testified to here that it has been made, Mr. McHale.

A. But that really would have no bearing on the value of 42d Street or 44th Street or 46th Street in my opinion.

Q. Has there not been a very large increase in values at 42d Street and along 42d Street in the last few years?

A. Not near as much as there has been south of 34th Street.

By Mr. Burr:

Q. As I see Mr. Greene's testimony, he is the one who fixed the valuation at $850.

Mr. Mathewson: No, he said they accepted his figure on that. You asked him if they did accept his figure on a previous condemnation proceeding and he said they did not, but accepted a lower figure, and then he said they did accept his figure in that condemnation proceeding at $900 and that has been awarded.

The Witness: I have not seen it, Mr. Mathewson.

Mr. Burr: He says, I have heard, that they gave $900 a foot.

Mr. Mathewson: Yes.

2879 Mr. Burr: As you are asking Mr. McHale if he heard that Mr. Green heard that it was awarded?

Mr. Mathewson: No, I am not asking him if he is familiar with the fact that that award had been made, and he replied that he did not know that it had been made.

The Witness: I was not familiar with it, no, sir.

By Mr. Mathewson:

Q. Do you know of an award for the bulkhead property between 42d and 43d Streets?

A. I have heard of it I was on that case.

Q. How much was that?

A. I don't just recollect.

Q. Was not that $500, or twice that you have figured here?

A. It was more than I figured.

Q. Is it not your recollection that it was $500?

A. Well, there were certain circumstances connected with that and perhaps I am a little more familiar with them than most people. There was a sea wall there that the city had built costing in the neighborhood of $300 per running foot, that the Commissioners allowed them for.

Q. Was not the award $600 or $650 between 42d and 43d Streets?

A. It was above my figures, but my figures were without the sea wall. There was a sea wall which cost all the way from $350 to $400 a running foot.

Q. What were your figures at that time?

A. I think $200 or $250.

Q. For whom did you testify in that connection?

A. The City of New York, but they awarded in addition the value of the sea wall.

Q. The City of New York was the party that was condemning the property at the time?

A. They were.

2880 Q. Was not the award for the sea wall separate from the bulkhead rights?

A. I don't think so.

Q. Now, you have given for the bulkhead rights at 44th Street to 46th Street, North River, only $200 per foot in your estimate. If there is not very much difference in value between 51st and 52d Streets and 42d Street, I suppose that there would be very little difference in value between 42d Street and 44th and 46th Streets, would there?

A. I think 42d Street is worth a little more because it is a thoroughfare, and I think bulkhead rights there are worth a little more than they are north of there.

Q. And are bulkhead rights at 44th to 46th Streets worth more than they are at 51st to 52d Streets?

A. I do not think so. I do not think there is but very little difference. It is all used for practically the same purposes, the landing of live stock and factories and one thing and another and building material. The leases do not show it. They are leased for about the same amount between 42d Street and you might say 59th Street. All the leases which I have here, some of them leased for less money really down towards 42d Street. It depends upon circumstances.

Q. If bulkhead rights are worth $650 at 58th Street and are worth $500 at 51st Street and 52d Streets, they certainly would be relatively worth more than $200 at 44th and 45th Streets?

A. I do not acknowledge your figures.

Q. I know, but on that assumption?

A. Most decidedly, yes, sir.

Q. I am merely taking the sale made at 51st Street and 52d Street, without arguing that that established a value.

A. Yes, sir.

Q. Now as to land under water at 44th and 45th Streets, you valued it at $2 a foot?

A. Yes, sir, or about $5,000 a city lot.

Q. On what basis do you make that estimate?

2881 A. It would cost a good deal to fill it between that and the bulkhead and would cost the difference between that and what I have allowed for the upland.

Q. You have proceeded on the same basis, allowing $2 at East 15th and 14th Streets?

A. Land under water?

Q. Yes.

A. No, I have taken it because I have some property in the same neighborhood which is better than 14th Street in my opinion.

Q. How far is the property you own from the property of the Consolidated Gas Company?

A. Ninth and Tenth Streets, only four blocks away.

Q. How much have you for sale at that price?

A. The whole block front with upland, also land under water, twenty-five lots. I will sell it at $3,000 a lot and the bulkhead at the rate of $150 a running foot.

Q. And the land under water at $2?

A. Less than $2, $3,000 a lot.

Q. What is the character of the upland there?

A. Flat land which used to be occupied by the Roach Shipbuilding Company, now owned by the estate of Roach.

Mr. BURR: The Novelty Iron Works?
The WITNESS: Yes.

Q. Do you own it personally?
A. I am sorry to say I do not own it. I have only got it for sale.
Q. For an estate?
A. For an estate, the Roach estate.
Q. Unimproved?
A. Unimproved.
Q. It brings in no income?
A. It does. The lots are rented at so much a year for the purpose of storing coal, lumber, etc., but there are no buildings on it.
Q. Do you know of any land under water which has been recently sold for $2 a foot in the neighborhood of West 44th and 45th Streets?
A. No, sir.
2882 Q. What do you consider the rental value of land under water in the vicinity of West 44th and 45th Street- per annum?
A. Well, it depends very largely upon circumstances. I know of leases by the City where they leased it as low as 5 cents a square foot per year, and I have known cases where it has rented for 25 cents as well.
Q. Don't you know that at West 40th Street, only four blocks from this property, land was leased at 25 cents?
A. It might have been.
Q. In 1887 and renewed in 1898?
A. It might have been. Where did you say it was?
Q. 924 square feet under water, West 40th Street. If you assume that this land under water at West 44th and 45th Streets, is worth 25 cents a square foot, which was the rate of that rental, what valuation would that make?
A. $12,500 a lot.
Q. How much would that be all told in place of the figures you have indicated here upon that basis?
A. I would have to figure that out.
Q. You took, didn't you, ten cents, or what did you take as the rental per square foot?
A. I did not take any rental? You mean between 44th and 45th Streets, land under water?
Q. Yes, supposing you assumed that to be rented or rentable at 25 cents per square foot per annum, as the land at 40th Street is rented, what valuation would you think applies to the land under water?
A. They are both the same as between 44th and 45th Streets.
Q. Yes, just the same, 401.6 feet.
A. It equals practically twelve lots, a trifle less than twelve lots, which would be practically $150,000 at $12,500 a lot.
Q. Let us take the Pleasant Avenue bulkheads next. If I understand correctly, you have valued the land under water there at $1 per square foot, is that right?
A. Yes, sir, about $2,500 a lot.

Q. Did you testify in the East River tunnel condemnation
2883 proceedings as to the value of land under the East River from 110th Street to Astoria?

A. I testified for the State as to the land under the river.

Q. Well, you testified as to the land under the river?

A. Yes.

Q. What did you testify was the value of the land under the bed of the East River per foot?

A. I don't just recollect now.

Q. Well you testified as to the value merely of an easement?

A. Of an easement.

Q. Was not your testimony that that was worth 40 cents a foot, for the easement?

A. I don't remember just what I testified.

Q. Is it not your best recollection that 40 cents per square foot of surface area of the section over the tunnel was easement?

A. I should have to refer to my testimony. That was two years ago, I think.

Q. Can you not remember what you did testify as to that?

A. I never carry those things in my head, Mr. Mathewson.

Q. I wish you would assure yourself on that subject and then I will ask you that if the value of an easement under the bed of the East River was worth 40 cents per square foot, how you reconciled that with the testimony that the value of land under water next to the bulkhead and useable is worth only $1 per square foot in fee.

A. I do not claim it is useable. There is a very swift current on the East River. This is right opposite Ward's Island, and it is almost impossible for a boat to stay there.

Q. Didn't you make your estimate of $1 on the theory it is unuseable?

A. It is not entirely so, but it is not adapted for shipping.

Q. Do you mean to say that if the easement of land under water under the bed of the East River, the tunnel being 200 feet down, is worth 40 cents per square foot that the value of land under water adjacent to the bulkhead at 110th Street from which that
2884 tunnel starts is worth only $1 per square foot?

A. I do, and if it were 300 feet, it would be worth more. The deeper down you go, say between 200 and 300 feet, it is worth more than if it was 10 feet, and I so testified, for the purposes of a tunnel.

Q. Explain that a little. I don't quite understand you.

A. In my opinion it was worth more 200 feet under the bed of the river than if it were 10 feet.

Q. What is worth more?

A. The land for the purpose of digging a tunnel.

Mr. Burr: That is, you mean the easement.

The Witness: The easement is worth more 100 feet below than it would be 10 feet or one foot.

By Mr. Mathewson:

Q. Is not a fee worth more than an easement?

A. Worth more, and I have allowed more.

Q. Do you mean to say then, that if the easement in the City relating to the land under the bed of the East River 200 feet down is worth 40 cents per square foot, in connection with this tunnel, that the land under water on the 110th Street front, inside the bulkhead line, is worth in fee only $1.00?

A. I do, and I think I was too modest in placing my value at 40 cents a foot on the tunnel for the easement.

Q. I do not see why you have allowed us anything here, in that case. Let us take the bulkhead rights which you have put at $100 per foot——

A. Running foot, yes, sir.

Q. Do you know what the bulkhead at 109th Street to 110th Street is leased for?

A. Is that by the City?

2885 Q. It was leased in 1905 by the City, I suppose, I am not sure for the moment.

A. Where did you say that was?

Q. 187 feet between 109th and 110th Streets?

A. I have not got that. There is record here.

Q. Assuming it were leased at $1,800 per year in 1905, that would indicate a greater value than $100 per front foot on that basis, would it not?

Mr. Burr: Is not that the lease which was never carried out, which has been spoken of?

Mr. Mathewson: I do not know, Mr. Burr. The testimony was that the lease of the bulkhead between 109th and 110th Streets was for $1,800 and that it was made in 1905.

The Witness: That would indicate a value of about $160 a foot capitalized on a six per cent. basis.

Q. Was this proceeding in reference to the East River Tunnel in which you testified for the State, a proceeding by the East River Gas Company to acquire from the State the right to put its tunnel under the river, as you understand it?

A. No, if I understand it, it was really the State and City jointly.

Q. Well, whatever it was, the object of it was to determine what the company should pay to the State for the right to put the tunnel under the East River?

A. Well, it was a question between the State and City as to who was entitled to compensation.

Q. That may be, but as far as the company was concerned?

A. As far as the company was concerned, yes.

Q. To determine what they should pay for the privilege of putting their tunnel under the East River?

A. Yes, sir.

2886 Q. Will you not be good enough to ascertain if you did not testify that the easement in that connection was worth to the State or whoever owned the land under the East River, forty cents a foot?

A. In my opinion it did, and I think if I had to testify again I would say fifty cents.

Q. Then you think it is worth fifty cents?

A. I think it is worth one-half of the fee for that particular purpose.

Q. Do you mean to say that a fee under the navigable water of the East River is worth half as much as the fee of land inside the bulkhead line?

A. In this particular instance, yes, for the purpose for which it was to be used. I assumed that the Consolidated Gas Company employed the brightest engineers in this country and Europe. They examined both sides of the river from 34th Street up to and above Ward's Island for the best location for their tunnel, and I assumed that it was the best location, consequently it was worth more to the— it was worth that much, not alone to your company, but to any other company for building a gas tunnel.

Q. This tunnel was run from 110th Street to Astoria?

A. Yes, between 110th Street and 111th Street in that little jog where it comes out to the bulkhead.

Q. Well, you know that the Department of Docks acquired in or subsequent to 1884 a number of bulkheads by agreement with the owners upon the approval of the Commissioners of the Sinking Fund, did they not?

A. I knew they did.

Q. And that has been their policy to acquire them?

A. They always tried to acquire them when they could get them for a reasonable compensation.

Q. Don't you know that the bulkhead rate varied then from $450 to $600 a foot?

A. Yes, and even down to $100 a foot.

Q. Where were they $100 a foot, give me an instance?

2887 A. If I remember right, there was one acquired here about the time you speak of, between Old 12th and 13th Streets. There were several at $200 a foot.

Q. How long ago was that?

A. In about 1885, I think. Then there were one or two acquired up this side of Corlies Hook at the rate of $200 a foot.

Q. Was not the price generally paid to owners $600 a foot for lengths over 25 or 30 feet?

A. No, sir.

Q. You think not?

A. I am positive they were not.

Q. Are you familiar with the Langdon cases decided in 1892?

Mr. Burr: Langdon against the Mayor?

Mr. Mathewson: Yes, for bulkheads taken in 1877.

A. Yes, but that was in connection with where the city destroyed the bulkhead rights.

Q. Yes, that may be, but do you know what the result of that judgment was?

A. That was on the North River?

Q. 150 feet below Charles Street.

A. Yes, I know the case very well, and have read and used it very often.

Q. Was not the judgment $600 per foot for these bulkheads which were taken in 1877?

A. I don't know, Mr. Mathewson, what the judgments were.

Q. Is it not your recollection that that is substantially it?

A. No, I haven't any recollection of the judgment, so I am not really competent to answer that question.

Q. You remember those are the cases tried before Ex-President Cleveland?

A. Yes, sir. Mr. Boardman was counsel.

2888 Q. If the judgment in that case was established at $600 per foot for bulkheads taken in 1877, that would indicate a larger valuation for these bulkhead rights relatively than any you have testified to?

A. Based upon that it would.

Q. Has not the City acquired at practically that same rate considerable bulkhead property all the way up to Gansevoort Street?

A. On the North River?

Q. Yes.

A. They acquired a good deal of it there, yes, sir; but it is a different proposition entirely. That is in the shipping section where all the large steamships land, and if bulkhead was left there to the statutory rate of wharfage, which they would be confined to, they would not earn 2 per cent. on the basis of $100 per running foot, but they are valuable to steamships and that is the reason high prices were paid for them. But that in my opinion is no criterion for bulkheads situated as I have testified to.

Q. Has not the trend been up the North River, of improvement in bulkhead property?

A. It does not go beyond 34th Street, in my opinion. Take it from 34th Street up to 59th Street, it is gridironed with railroads, slaughter houses and live stock yards and things like that. It is no comparison with south of there where you are right in connection with large railroads on the Jersey Shore and the large wholesale houses and retail stores in the City of New York.

Q. Everything has been moving uptown. The Hudson River Day Line is now at 41st Street and the Sandy Hook Line?

A. Yes, they have a stopping place there.

Q. And the tendency of these shipping points and ferries is to extend uptown, is it not? It is the only way they can extend now, isn't that a fact?

A. It is the only way they can extend.

2889 Q. Are there any Transatlantic Lines now north as far as 34th Street?

A. Yes, the Italian Line is at 34th Street.

Q. Are you familiar with the sale made by Moore to the City of bulkhead rights as far back as 1892 between 23d and 24th Streets for about $500—for exactly $500?

A. It is a question of record.

Q. Well, I ask you if you are familiar with it?

A. No.

Q. You did not take that into consideration of course?

A. No. It is one of the best locations in the city, and in my opinion would have no bearing on this 44th Street property.

Q. Are you familiar with the judgments obtained by the owners between West 28th and 29th Streets, and between West 29th and 30th Streets, about December, 1893, for bulkhead rights at the rate of $500, less an estimated cost of construction of the bulkheads of $75 a foot, or $425 net?

A. No, sir.

Redirect examination by Mr. **Burr**:

Q. What do you mean by the statutory rate of wharfage?

A. Regulated by the state in reference to the amount that owners of bulkheads or open piers can charge for wharfage.

Q. That rate does not apply to these piers you were speaking of or bulkheads?

A. It does, yes; it would apply to them.

Q. I mean——

A. My values have not been based upon the statutory rate of wharfage, no.

Q. Your valuation was based, I suppose, upon the assumption that the Consolidated Gas Company owned these bulkhead properties and piers.

A. I assumed that they did; yes, sir. All my valuations are based on the assumption that they owned the bulkhead rights and the land under water.

Q. Now, as a basis for your valuation, have you a record of leases and sales which you have consulted?

2890 A. I have. I have not really paid any attention to the sales, Mr. Burr, for the reason that in my opinion there has not been a sufficient number of sales there on the North River or East River to base my valuations on. I have considered leases which, under ordinary circumstances, in my opinion is a very good basis of values. I have all the city leases and also am familiar with most of the private leases.

Q. In arriving at your valuation as to the Tompkins Street water front, did you take into consideration any leases in that immediate neighborhood?

A. I did, and also property that I have for sale as well.

Q. That is the property of the Roach estate?

A. Yes.

Q. And you have those here with you, the record of such leases?

A. Yes, I have all the City leases here.

Q. I mean the leases that you consulted in making up your opinion as to the value of that property?

A. Yes, those are all here, both on the North River and East River.

Q. And the same applies to 41st Street and 42d Street, that is, you have the record of the leases there upon which you have based your judgment?

A. Yes, sir.

Q. 44th and 45th Streets?

A. Yes, sir.

Q. And 45th and 46th Streets?

A. Yes, sir.

Q. And Pleasant Avenue and 110th and 111th Streets?

A. Yes, sir.

Q. So that if Mr. Mathewson should ask you upon what you based your valuations on you have your data here to inform him?

A. Yes, sir.

By Mr. Mathewson:

Q. Referring to the 22nd Street pier and your reply that you have largely based your answers as to valuations on rentals, are
2891 you familiar with the lease of that pier at West 22nd Street
which was made at a public sale from May 1, 1886 to May 1, 1901 at $2,500 per annum?

A. What pier?

Q. Twenty-second Street pier. What was the rental paid for that? Wasn't it $2,500 a year?

A. North River, West 22nd Street, pier with water front 32,408 square feet, to Olcott, from May 1, 1902 to May 1, 1912, for $18,333.33.

Q. Wasn't that pier rented for a five-year term from May 1, 1886, to May 1, 1891 at $2,500 per annum as against the present rental of——

A. 1881? I haven't that lease away back there. It is no criterion. It is ten years ago.

Q. I am showing the increase in valuations in that section. And haven't you a record showing that from May, 1886 to May, 1891 it was $2,500 per annum and from May 1, 1891 to May, 1898, it jumped to $11,500 per annum or 360 per cent.?

A. I have taken the leases, sir, from 1900. I have given you all the advantages of the increase. There has been an increase.

Q. Have you any doubt that the figures I have given you as to those two years are correct?

A. I have not the slightest doubt that what you say is true.

Q. That is the information that I have at any rate.

A. Yes.

Q. And if that be so that would indicate an enormous increase as early as 1891.

A. There was a big increase in that section. That is the time when all those steamship companies commenced to go in the Chelsea section. There was a decided increase during those years.

Q. This term expired then, May, 1891, to May, 1898, at a rental of $11,500?

A. Yes.

Q. And you say the present rental is what?

A. This is the rental of a shedded pier.

2892 Q. How much?

A. A great big modern pier built by the city, $18,333.33. That is for an improved pier built by the city, shedded.

By Mr. **Burr**:

Q. That pier in 1890 was a very short pier?

A. A very short pier and, if I remember right, it was really a non-shedded pier. A non-shedded pier is restricted to the statutory rate of wharfage and it is a very different proposition than a shedded pier. A shedded pier can charge or make any arrangements it sees fit, just as you could for this building. A non-shedded pier is restricted to the statutory rate of wharfage.

By Mr. **Mathewson**:

Q. You can shed any pier?

A. No, you have to apply to the Dock Department, you have to get a permit.

Q. It appears by my memorandum that this pier was extended in 1892 by a resolution of the Board only twenty-seven feet on the north side and forty-five feet on the south side. But the rental was increased in 1892 from $11,500 to $12,519.26 per annum by reason of the increase.

A. This is a different kind of a pier entirely, Mr. Mathewson. This is a shedded pier, and I think it is a very low rental for a shedded pier.

Q. At that point?

A. At that point, I do. I think it is a very low rental for that.

By Mr. **Burr**:

Q. In arriving at a valuation in regard to such bulkhead property as this, what other circumstances do you consider besides the sales where you can find them, or leases. Do you take into consideration the character of the neighborhood and the approachability

2893 of the bulkhead by water and all that?

A. What it is best adapted for, yes, sir, always.

Q. Now, take the Tompkins Street water front. What leases in that neighborhood did you consider as the basis besides the other considerations you speak of in arriving at your valuations there?

A. Well, here is a lease right here at the foot of East 14th Street, Murray & Company, bulkhead, East 14th Street, 111 feet, leased for $525. The capitalization on a six per cent. basis would be $80 a foot.

By Mr. **Mathewson**:

Q. Bulkhead?

A. Yes, sir; 111 feet. Then knowing the conditions of the East River for the past twenty years, in regard to what the City gets and what I have got for sales through that section those are the very best elements of values I had to apply to 14th Street.

By Mr. **Burr**:

Q. Now, is there any other one you want to refer to in that neighborhood?

A. No, not necessarily. I do not think it is necessary.

Q. Well, take 41st and 42d Streets. What leases or sales in that neighborhood influenced your judgment in fixing the valuation?

A. You mean on the North River?

Q. On the North River.

A. Well, here is Pier 76 West 36th Street, 25,265 square feet, rented to the New York Central & Hudson River Railroad Company for $20,000 a year.

By Mr. **Mathewson**:

Q. When was that rented?

A. October 8th, 1904. Here is Pier 77, West 37th Street, 30,100 square feet, rented July 1st, 1901, for a term of twenty years.
2894 That is, in fact it is rented for thirty years, three renewals at $11,000 a year.

By Mr. **Burr**:

Q. What would that make it?

A. That would show really a valuation of the pier of about—a pier is a little different than a bulkhead as to capitalization. In other words, I capitalize a bulkhead at six per cent. where I capitalize a pier at eight per cent.

Q. That is on account of the higher valuation for the pier that Mr. Wheelock and Mr. Greene gave?

A. Yes. The difference is this: In a pier I allow one per cent. for a sinking fund, and two per cent. for maintenance of pier, collecting rents and such things. On a bulkhead you have only repairs which is not near as much in proportion to the value of the bulkhead as it is to the pier.

Mr. **Mathewson**: Capitalization at a higher rate would produce a lower capitalization rather than a higher one, as compared with Mr. Wheelock and Mr. Green.

The **Witness**: Well, I mean per square foot. I should say about $3.50 a square foot for pier rights, sir.

By Mr. **Burr**:

Q. You have given $6.00 here?

A. Yes, sir.

By Mr. **Mathewson**:

Q. $3.50 per square foot?

A. Yes, sir. That would show a valuation of $137,500 or nearly $4.00 a square foot for the pier rights including the structure.

Q. That would not be the bulkhead rights?

A. No, sir.

2895 Mr. **Burr**: He has figured pier rights at $6.00 and the lease figures out at $4.00.

The **Witness**: I have given you the benefit of that. Here is a pier, 78 West 38th Street, 37,364 square feet, for the same length of time, at $11,000. That really is less, about $3.75 per square foot for pier rights.

Pier 74, foot of 39th Street, 200 feet south of the dump, with dumping privilege, 4,780 square feet, for $1,250 a year. That was on a ten-year lease.

Here is also Pier 79, foot of 39th Street, 150 feet north of pier, with ice privilege, &c., People's Co-operative Ice Company "Pleasure of the Board." That is $1,575. I did not take that into consideration, for my opinion where a pier is leased where the Board can revoke the lease at any time or break it at any time, it does not show the true value of the pier.

By Mr. Burr:

Q. Well, that will do for that part. Now, suppose you take and tell us by what method, under what consideration, you arrived at your valuation as to 44th and 45th Streets, the land under water?

A. The same. The land under water.

Q. Yes.

A. Well, in my opinion it could be leased for—could be capitalized on about the figures I have stated.

By Mr. Mathewson:

Q. About how much per foot was that?

A. I think about six cents per foot.

By Mr. Burr:

2896 Q. Now, as to the Pleasant Avenue water front, 110th and 111th Streets, how did you arrive at your valuation there per square foot?

A. Land under water?

Q. Yes.

A. In the same way, sir.

Q. And the bulkhead, 212 feet, at $100?

A. $100 a foot, in my opinion.

Q. You resorted to the same method pursued in the other cases you have now described?

A. I did, the very same, sir.

By Mr. Mathewson:

Q. From what record are you giving the details as to these leases?

A. The record of the Dock Department, which is a public document. Here is one of them here (indicating a bound book).

Q. You took no part personally in making any of these leases?

A. I did not, no, sir.

Q. Or any negotiations respecting them?

A. No, sir, I did not.

Q. You were never connected with the Dock Department, were you?

A. I am sorry to say that I was not; no, sir.

A recess is now declared till 2:10 P. M.

After Recess.

Martin McHale resumes the stand.

Direct examination by Mr. **Burr**:

Q. What is the total assessment of all this real estate of the Consolidated Gas Company with regard to which you have been testifying including bulkheads, land under water, pier- and pier rights, etc., excepting Shadyside and excluding buildings as appears by the Exhibit in evidence here?

A. $10,348,513.

2897 Q. I ask you what is the assessed valuation?

A. $8,508,100.

By Mr. **Mathewson**:

Q. That excludes Shadyside and excludes all buildings, and excludes the 18th Street property taken for improvement?

A. Yes. You mean by the City?

Q. Yes.

A. It does, yes, sir. That is $8,508,100.

By Mr. **Burr**:

Q. And your testimony excludes those also?

A. Also.

Q. What is your total?

A. The total without improvements is $10,348,513.

Q. What percentage of that valuation is the assessed valuation?

A. 78½ per cent.

John M. Thompson, recalled for further examination.

Direct examination by Mr. **Burr**:

Q. Have you made water front property in the City of New York a study, and if so, for how long?

A. Why in connection with my business for the last four or five years.

Q. Are you familiar with the sales and leases of pier and bulkhead properties in the City of New York on the North and East Rivers?

A. Yes, sir.

Q. Have you sold any bulkhead property?

A. Yes, sir.

Q. What property?

A. I sold North River and 49th Street, 117 by 686 feet; that is 686 feet of course being land under water; 117 feet of bulkhead by 686 feet under water.

2898 By Mr. **Mathewson**:

Q. Does that mean lineal feet?

A. Lineal feet; 686 feet on each side.

By Mr. **Burr**:

Q. When was that?

A. That was in June, 1903.

Q. Have you appraised water front property?

A. I would like to say in addition that I have sold a water front property in Astoria very near the gas works. That was about ten acres with riparian rights.

Q. Have you bought any bulkhead property, water front property?

A. No, sir.

Q. Have you appraised water front property for any parties?

A. Yes, sir.

Q. For whom?

A. I appraised the bulkhead property and the land under water at the foot of 9th and 10th Street-, for the estate of John Roach. I appraised the bulkhead at the foot of 28th and 29th Streets, East River—the other being the East River also—for the city of New York in the Bellevue Hospital proceedings. And I appraised the land under water—riparian rights I should say, on the Long Island side extending from White Avenue to Ditmars Avenue, in Astoria, for the East River Land Company, I think it is.

Q. I think you said something on your previous examination about the bulkhead property that you bought. Was it from Mary Ryan to Judge Dugro?

A. Yes, sir sale from Mary Ryan to Judge Dugro; 1903.

Q. What property was that?

A. Forty-ninth Street and North River property.

Q. What price did you receive for that?

A. $60,000.

Q. And at what figure was the bulkhead?

A. The bulkhead I sold at $100 a foot, making $11,700. 2899 Land under water at sixty cents a square foot, making $48,297 or a total of $59,997, or within $3 of the $60,000.

Q. At sixty cents a square foot?

A. Yes, sir.

By Mr. MATHEWSON:

Q. Not six cents?

A. Sixty cents.

Q. I thought Mr. McHale had his at six?

A. No, sir. That was a rental value of six cents.

By Mr. BURR:

Q. Have you examined the water front property of the Consolidated Gas Company as the same appears on Exhibit 48 here?

A. Yes, sir.

Q. Including bulkhead, piers and land under water?

A. Yes, sir.

Q. Will you take up the first piece?

Mr. MATHEWSON: I wish to enter an objection against the competency of this witness. I do not think he has been qualified.

Objection overruled; exception.

A. Which is the first piece?

A. The Tompkins Street, East River, between 14th and 16th Street-, land under water, 450 by 70 feet, containing 30,318 square feet, at $2.00 per square foot, $60,636. Bulkhead, 446.4 feet, at $200 per lineal foot, $89,480; total, $150,116.

North River, between 41st and 42d Streets, bulkhead, 197½ feet, at $250 per lineal foot, $49,375.

Pier, $252,000, being 42,000 feet, at $6.00 a square foot, assuming that such pier can be built there. Total, $301,375.

North River, between 44th and 45th Streets, land under water, 14,756.10 square feet, at $2.00, $29,512.20.

2900 Between 45th and 46th Streets, 14,756.10 square feet, at $2.00, $29,512.20; or a total *of* land under water of $59,024.40.

The bulkhead between 44th and 45th Streets, 200.83 feet, at $200 a lineal foot, $40,166.

Between 45th and 46th Streets, 200.83 feet, at $200 a lineal foot, $40,166, or a total for the bulkhead of $80,332; and a grand total for the land under water and bulkhead of $139,356.40.

Pleasant Avenue, between 110th and 11th Streets, land under water, 9,400 square feet, at $1.00 per square foot, $9,400.

Bulkhead, 212 feet, at $100 per lineal foot, $21,200; total, $30,600.

Shadyside, about 611,710 square feet, or two hundred and forty-five city lots of upland, including the river front, at $1,000 per lot, $245,000.

Mr. MATHEWSON: As to the Shadyside I do not think any question has been asked of the witness and I would like to ask him one or two questions as to his Jersey experience.

Mr. BURR: Certainly.

By Mr. MATHEWSON:

Q. Have you ever bought and sold land in New Jersey?

A. Yes, sir, but nowheres near this property.

Mr. MATHEWSON: I move to strike out the testimony of the witness respecting his valuation as to Shadyside.

Mr. BURR: He will describe how he arrived at his valuation. He has not given the valuation yet.

Mr. MATHEWSON: Well, you have not qualified him. I do not have to anticipate.

2901 By Mr. BURR:

Q. Well, state how you arrived at your valuation of Shadyside?

A. My valuation of Shadyside was arrived at from the experience that I have had in the last eighteen months in water fronts all along the East River and Newtown Creek and Long Island City, and by comparison and deduction between properties over there and this property in Jersey, based upon my general experience as a real estate man.

Mr. MATHEWSON: I submit that that——

The **Master**: It is pretty remote. I will overrule the objection and let it in for what it is worth.

Exception.

Q. Now give us your valuation of Shadyside?

A. I gave that, sir.

Q. Now, that makes a total of bulkhead property——

A. It makes a total of bulkhead property including Shadyside of $866,447.40.

Mr. **Mathewson**: Wait a minute. Mr. McHale gave $871,447.40, and his figures in detail are identical with yours. Which is right?

The **Witness**: There is a mistake in Mr. McHale's addition, then.

By Mr. **Mathewson**:

Q. Your's is the Simon-pure correct total, is it?

A. It looks that way to me, sir.

Q. How much is it?

A. $866,447.40.

Q. Well, let me see. That includes then just the bulkhead, land under water, and pier rights to which you have testified at this session plus Shadyside?

A. Yes, sir.

2902 By Mr. **Burr**:

Q. That makes a grand total valuation of all the property that you have testified regarding of how much?

A. $10,486,356.15.

By Mr. **Mathewson**:

Q. Does this include the West Side property on the theory that the company owns 12th Avenue which it now occupies, or does it exclude 12th Avenue?

A. It excludes 12th Avenue.

Q. Well, if the company owns 12th Avenue it would add the difference which you——

A. I would like to suspend that question. I have not my book with me and really I do not remember what total I took on that when I made up my additions this morning. If you leave the question open I will answer it later. I really don't remember which total I took. I did it hurriedly.

Mr. **Burr**: Can I send around for your book?

The **Witness**: Yes, sir. It includes 12th Avenue. Mr. McHale states it includes 12th Avenue. He has evidently made a mistake in his figures.

By Mr. **Burr**:

Q. The total assessed valuation of all this property regarding which you have testified as appears by the evidence amounts to how much?

A. $8,508,100 without improvements and without Shadyside.

Q. And your valuation without Shadyside and without improvements amounts to how much?

A. $10,144,856.

Mr. MATHEWSON: Ought not we put in at the conclusion of 2903 Mr. McHale's testimony that this does not include Shadyside because his testimony was that the property he testified to——

Mr. BURR: He said excepting Shadyside.

Mr. MATHEWSON: Very good then, if it is clear.

Q. What percentage of your valuation is the assessed valuation?

A. 80.7.

Cross-examination by Mr. MATHEWSON:

Q. I see that your figures in every instance for bulkhead, water rights, pier properties, and Shadyside coincide to a cent with Mr. McHale's?

A. Yes, sir.

Q. I judge that these figures are the results of collaboration between you and Mr. McHale.

A. Yes, sir; Mr. McHale and I appraised all of those water fronts together, I think.

Q. And you agree to a cent on every piece?

A. Yes, sir.

Q. I understand this is your independent judgment, and Mr. McHale's is his independent judgment?

A. Yes, sir; at the same time in conjunction.

Q. In reference to your bulkhead property, East 14th and East 15th Streets which you have valued at $200 per foot, are you familiar with the condemnation proceedings of the 19th and 20th Streets bulkheads, in behalf of the city?

A. I know of them, yes, sir.

Q. Do you know that $300 is fixed in this proceeding as the value of the bulkhead?

A. I have so understood.

Q. Similarly are you aware that between 20th and 21st Streets, East River, the bulkhead was fixed in condemnation proceedings, at the instance of the City of New York, as $350 per foot?

A. I believe so, yes, sir.

2904 Q. Have you taken those into consideration in reaching your $200 per foot?

A. Yes, sir.

Q. Do you know what the difference in the character of the current is, or otherwise, affecting the value of bulkhead rights at 14th and 15th Streets as compared with 19th and 20th Streets, or 20th and 21st Streets?

A. I don't think there is a difference of $150 a foot, but I think there is a slight difference in favor of the 20th and 21st Streets on account of the width of the river there; it widens out.

Q. If these figures, $300 for 19th and 20th Streets, and $350 for 20th and 21st Streets be correct, relatively 14th and 15th Streets would be more than $200, wouldn't it?

A. I don't know that it would. Those were in condemnation proceedings.

Q. Just observe my question. I say assuming that to represent the true value at 19th and 20th Streets and 20th and 21st Streets, then the value at 14th Street relatively would be greater than $200?

A. On that assumption, yes, sir.

Q. Now as to land under water which you have estimated at $2 a square foot, are you aware of any land close to that which recently sold for $2 per square foot?

A. No, sir, I don't know of any recent sales of land under water except that one I testified to.

Q. In this Roach estate between 9th and 10th Streets, where you made an appraisal as you say, is the same Roach estate to which Mr. McHale has referred in his testimony, isn't it?

A. Yes, sir. Property I have for sale. At the figures Mr. McHale stated I appraised it and had it for sale.

Q. And Mr. McHale also stated he had it for sale?

A. Yes, sir; and have had it for sale for several years.

Q. Which was the Bellevue Hospital site?

A. 28th and 29th Streets, sir.

Q. And the East River?

A. Yes, sir.

2905 Q. Were bulkhead rights condemned there?

A. They have not been condemned yet. The testimony is in but the Commission has not finished the case yet.

Q. Turning now to the water front property on West 41st and 42d Street, you valued the bulkhead there at $250 per foot?

A. Yes, sir.

Q. And do you know of any bulkhead property that has sold in that vicinity recently at $250 per foot?

A. The only sale I can refer to is the one at 49th Street, sold three years ago at $100 a foot.

Q. That is the one from Ryan to Dugro?

A. Yes, sir.

Q. Was there any bulkhead built there at the time?

A. Yes, sir.

Q. Was it fully constructed across the frontage of one hundred and seventeen feet?

A. That I am not able to state now.

Q. What was the character of the upland at 49th Street?

A. In what way, sir?

Q. I mean was it precipitous?

A. Oh, no, sir.

Q. Was the New York Central Railway track between the upland and the dock property?

A. No, sir.

Q. You would not have to cross the railway to reach that?

A. No, sir.

Q. Does not the New York Central track run from 30th Street all the way up near the North River or through 11th Avenue?

A. It runs through 11th Avenue, but I do not think it is at 12th Avenue at that point.

Q. You do not think so?

A. No, I do not think so. I have not been there in three years and really do not recall.

Q. What Ryan was it that made this sale to Dugro?

A. Mary Ryan.

Q. Was it an estate or an individual?

2906 A. I have the contract here in my pocket, sir. I can tell you in a moment. It was an individual.

Q. Does she reside here in New York City?

A. I think so. She did at that time.

Q. Do you know where in New York City?

A. No, sir, but she is the mother of the late William M. Ryan, a real estate broker. I really don't know where she does reside. I did know at that time.

Q. This was to Judge Dugro?

A. Yes, sir.

By Mr. BURR:

Q. You have the original contract there?

A. I have the original contract here, yes, sir.

By Mr. MATHEWSON:

Q. Are you aware that the bulkhead at 58th and 59th Street sold for $650 per foot as Mr. Wheelock testified?

A. I have so understood.

Q. And are you aware that the bulkhead of 51st and 52d Streets and North River was fixed in condemnation proceedings at the instance of the City of New York as worth $500 per foot?

A. I think so, yes, sir.

Q. If those figures represent the actual value at 58th and 59th Streets and at 51st and 52d respectively, then relatively the value of 42d Street would be greater than $250, would it not, per foot?

A. If those figures represented the value, yes, sir.

Q. Is not the water front property at 42d Street worth more than the water front property at 51st and 52d Streets, or 58th and 59th Streets, per foot?

A. I think so, sir, but I know nothing of that sale for $650.

Q. No, I am asking relatively?

A. Relatively 42d Street is worth more.

Q. Assuming that 58th and 59th Streets was worth $650 per front foot, would not on that basis the bulkhead property at 42d 2907 Street be worth $750 per foot?

A. No, sir, I should say $700 a foot. I do not think there would be more than $50 a foot between the two.

Q. Are you familiar with the condemnation proceedings at 22d and 23d Streets, North River, respecting which Mr. Green testified, that as he understood it, $900 a foot had been allowed by the Commissioners in condemnation?

A. Yes, sir, $900 has not been allowed.

Q. The Commission has not reported yet?

A. No, sir.

Q. That is your information?

A. Yes, sir.

Q. If Mr. Green thought they had then you think Mr. Green is mistaken?

A. I think he is mistaken, yes, sir. I tried to verify that at lunch time but I was unable to do so.

Q. What rate per square foot have you estimated as the value of the land under water at 42d Street in estimating the pier property as worth $252,000?

A. I have not estimated the land under water there, except, I believe, the land under water could be utilized and that the owners would be allowed to build a pier sixty feet wide and seven hundred feet long, that would be extending from the bulkhead line to the pierhead line established by the Secretary of War in 1900.

Q. That means the use there for pier or for slips alongside pier of what area in square feet?

A. 42,000 square feet.

Q. And what would $252,000 represent per square foot?

A. $6.00 per square foot.

Q. Now, take 44th and 45th Streets and the North River, do you mean to say that the land under water at 44th and 45th Streets and North River would be worth only $2.00 per square foot if the computation of $6.00 per square foot for 42d Street is correct?

2908 A. Yes, sir, because that is a different proposition. One is land under water and the other is a right to build a pier.

Q. Well, the right to build a pier really involves the use of land under water.

A. Yes, sir.

Q. Or rather of the surface above the land under water, either for a pier or for slips.

A. Yes, sir.

Q. Is there any reason why at 44th Street the company should not pursue either course which it sees fit in the use of its land under water?

A. No, sir; but they have never availed themselves of their pierhead rights there, and they have done so down at 41st and 42d Streets.

Q. But the land under water or the surface above the land under water is possible of utilization in the same manner as at 42d Street if the company chooses to do so, isn't it?

A. Yes, sir.

Q. And in that event wouldn't it be worth more than two dollars a square foot, if it is worth $6.00 at 42d Street?

A. Why, yes, sir; if you have the right to build the pier out there, and this land under water is available for pier purposes, it would be, yes, sir.

Q. What would be the difference between 42d Street and this in the value of the land under water on that assumption?

A. Well, on that assumption I don't think it would make any difference, possibly fifty cents a foot.

Q. That is $5.50 or $6 at 45th and 44th Streets?

A. Yes, sir. I would like to make some explanation. I have only taken these measurements from the testimony. As I understand it, you have only got seventy feet of land under water there in depth and you could not build a pier out there. The testimony shows you have seventy by two hundred feet ten inches, and on that assumption you could not build a pier.

Q. That is at the bulkhead line, is it not?

2909 A. The land under water is testified by your expert from which I have taken these figures to be seventy by two hundred feet ten inches.

Q. Aren't you aware there are four hundred and eighty feet more of water out to the line of 13th Avenue?

A. I was not called on to testify to that. I only took what your experts testified to. If you wish me to testify to that, that would be a separate proposition.

Q. Assuming that to be so, then the value of the land under water would be available to 42d Street as you testified a moment ago?

A. Assuming that to be so, sir, I would have to re-appraise the property.

Q. Do you know of any actual sales of land under water recently in that vicinity at $2?

A. Three years ago the Mary Ryan sale at eighty cents a square foot.

Q. You have already testified to that.

A. No, others, except, of course, that East River land that I have for sale at less than that.

Q. That is East River. This is North River?

A. Yes, sir.

Q. Referring now to the bulkhead property at Pleasant Avenue and 110th and 111th Streets, did you hear Mr. McHale's testimony that he also appraised the land under water at one dollar per square foot?

A. Yes, sir.

Q. Do you concur with him that if an easement to put a tunnel two hundred feet under the East River was worth fifty cents or forty cents per square foot that the value of land inside the bulkhead line at 110th Street in fee would be only one dollar per foot?

A. I never testified to a tunnel under the river, and it would be impossible for me to answer that question.

Q. I know you did not.

2910 A. I could not answer the question. I have no idea what a tunnel under the river is worth. I have no idea what the easement is worth.

Q. And if the easement be worth that amount you could not form any opinion as to whether the bulkhead land under water would be worth twice as much?

A. I am positive that the land under water at that bulkhead is worth one dollar a square foot. As to the easement I don't know.

Q. Take the bulkhead which you have appraised at $100 per lineal foot?

A. Yes, sir.

Q. Are you familiar with the fact that a lease was made in 1905 of one hundred and eighty-seven feet of bulkhead between 109th and 110th Streets at $1,800 a year? It was testified to by Mr. Wheelock at page 1142 of the record.

A. I am not aware of that, sir.

Q. Assuming that the lease was made as Mr. Wheelock testified, at $1,800 a year, Mr. McHale has figured and testified that that would mean a value of the bulkhead at about $160 per lineal foot, capitalizing the rental at 6 per cent. Is that your computation, or would you accept his?

A. I would first want to know the conditions of that lease.

Q. No, I say assuming it.

A. Oh, assuming it. Yes, sir, that is about right.

Q. Well, property or bulkhead rights between 110th and 111th Streets would not be less valuable than between 109th and 110th, would they?

A. No, sir.

Q. So that if bulkhead property is worth $160 between 109th and 110th Streets, it would be worth as much between 110th and 111th Streets?

A. On that assumption, yes, sir.

Q. Are you also familiar with the policy of the Dock Department of the city in acquiring water rights since 1884 down to date? Do you know that has been their policy to acquire them?

A. Yes, sir.

2911 Q. And are you not also familiar with the fact that they paid generally from $450 to $600 per foot even as far back as the '80's, to acquire water front property?

A. No, sir, I don't think that the minimum figure was as high as that.

Q. Didn't they pay from $450 to $600 a foot generally for short pieces of twenty-five feet or thereabouts under one ownership and from $500 to $600 per foot for greater lengths?

A. That is possible, sir. I would not like to dispute it, but I think it is rather high.

Q. Well, you know a great deal of water front was acquired as high as $600 per foot for lengths of over twenty-five or thirty feet from your study?

A. Yes, sir.

Mr. Burr: Mr. McHale has testified that was in the shipping section.

Q. And under legal proceedings the city acquired various water front property at $500 per foot or more?

A. Well, just as Mr. Burr said, it was in the shipping district.

Q. Well, that may be, that is another thing. I ask you whether that is not the fact?

A. Yes, sir, that is a fact.

Q. And are you familiar with the Langdon cases where a rate of $600 per foot for one hundred and fifty feet between King and West Houston Streets was established and for two hundred feet between West Houston and Clarkson Streets for bulkheads taken as far back as 1877?

A. I know the cases; yes, sir.

Q. That is correct, isn't it, as to the figure?

A. I think it is.

Q. Are you aware that in 1892 the City purchased bulkhead prop-
erty between 20th and 21st Streets from the General Theolog-
2912 ical Seminary for $300 a foot, fourteen years ago?

A. Yes, sir, I believe so. What streets was that between?

Q. Between West 20th and 21st Streets?

A. Yes, sir.

Mr. Mathewson: I wish to say, that the offer was accepted by the city, but I am not sure whether the transaction was finally carried out. I think the property was subsequently condemned.

The Witness: I think it was condemned.

Mr. Mathewson: I think that arrangement was rescinded for some reason.

Q. Are you familiar with the fact that about December, 1903, the City acquired bulkhead rights between 28th and 30th Streets and North River at $500 a foot, less a small estimated figure for the construction of the bulkhead?

A. No, sir; I don't recall that one.

Q. It is true, is it not, that water front property, dock property on the deep water of the North River has been continually and rapidly advancing in value within the last fifteen or twenty years?

A. South of 23d Street, a great deal; north of 23d Street, to a less degree.

Q. But it has been advancing all along the North River water front, has it not?

A. Yes, sir.

Q. Now, it is in evidence that 924 square feet of land under water at West 40th Street was leased in 1877 and renewed in 1898 at $231 per annum, which would be at the rate of 25 cents per square foot. Have you not known of land under water being leased along the North River as high as 25 cents per square foot?

A. That is the case with 924 feet, yes, sir; but not for a large body of it.

2913 Q. Is not a large body of bulkhead property for many uses more valuable than a small body of bulkhead property?

A. You are speaking of land under water?

Q. Yes, and for land under water the same thing.

A. It would depend entirely upon the locality, whether they could use it or not.

Q. Quite true, but if you have enough land under water so you can build a pier with slips on either side for boats is not that more valuable than if you had a smaller amount of land which would not permit either by the width or length of it of the building of a pier with such slips?

A. I doubt very much whether it would be worth more per foot than 25 cents a foot, 924 feet, the City could hardly have leased it for less.

Q. Why was the City paying more for bulkhead rights where the bulkheads were over 25 feet long than for shorter lengths?

A. We were speaking of land under water and not bulkheads.

Q. Yes, and now we are speaking of bulkheads. Does not the same rule apply?

A. No, sir; I do not think it applies. I do not think you could lease the Ryan property of 80,000 feet for 25 cents a foot, and while you might 924 feet, I don't think you could lease 80,000 feet at that rate.

Q. What is the length of the Ryan property?

A. 117 feet.

Q. Do you consider that an excessive length for a bulkhead, to acquire a maximum rental per square foot?

A. No.

Q. Well, if you pay 25 cents per square foot as the rental of land under water at 40th Street, the rental value of land under water at 45th Street would not be appreciably less, would it?

A. Not on that assumption, no, sir.

2914 Q. And if you assumed a rental value of 25 cents per square foot, can you tell me what value that would give for the land under water at 44th to 46th Streets capitalized at the rate you have taken, 6 per cent.?

A. I have taken 5 per cent. for land under water. There are no expenses for land under water.

Q. Well, 5 per cent.?

A. On that assumption it would be $12,500.

Q. For the entire land under water?

A. $12,500 per lot.

Q. How much would that be for the entire amount of land under water?

A. 41st to 42d Street?

Q. No, 44th to 46th Street. It would be about $150,000, wouldn't it?

A. On that assumption it would be $147,560.

Q. Is it not a fact that bulkhead property and water right property on the North River and on the East River in the City of New York is closely held and is difficult to acquire?

A. I don't know. I have in addition to the piece on the East River, 9th and 10th Streets, I have another piece from John C. Sheehan, I think it is 114th to 115th Street.

Q. The East River?

A. Yes, sir; and then I have a piece that I am negotiating for or was in negotiation for recently with Simonson, the lumber man in that neighborhood, 108th, 109th, 110th Streets. Of course there are not very many; there are not very many on the Island.

Q. The supply that can be acquired is limited?

A. No question about that.

Q. And it is becoming more limited relative to the business of the port all the time?

A. Yes, sir.

Redirect examination by Mr. **Burr**:

Q. You and Mr. McHale have the same theory as to value therefore your figures are practically identical.

A. Yes, sir; we figured on the same basis of capitalization, therefore our results must be the same.

2915 Q. And in giving these figures, you have assumed that the Consolidated Gas Company owns the bulkhead and piers?

A. Yes, sir.

Mr. BURR: That is all the evidence I have to-day.

Mr. MATHEWSON: In regard to this motion, I have read the request spread upon the record yesterday by Mr. Burr and Mr. Kirby, relating to an examination of the Company's plants and books. The plant is being examined so that that is disposed of.

The first request is that the defendant be permitted to examine all documents and books relating to or upon which Exhibit 94 is based. There is no objection to that.

The MASTER: That is being done, as I understand.

Mr. MATHEWSON: That is being done, and we supposed that we had given consent to that weeks ago, and that it had been done. Second, to examine all books and documents relating to or upon which is based the cost of gas for some particular year, between the years 1900 and 1905. We cannot concede to that. We consider that the cost of production of gas now is the criterion, and labor and material and other things are distinctly different in cost in previous years.

Third, that the accountants shall be permitted to examine all the books and documents relating to or upon which the actual structural cost is based in 1884, or subsequent thereto, and also all of the books of the six companies which in 1884 joined together as the Consolidated Gas Company. I had instructed the officers of the Company to permit the examination of books and documents 2916 of 1905, covering all vouchers so far as desired, relating to the cost of operation as shown in Exhibit 94, and the construction account and repairs and renewals account, which I think cover all or substantially all of the vouchers for 1905.

So far as relates to the period prior to 1905, the complainant put in an exhibit showing the repairs and renewals for the period from 1884 to 1905 and there is no objection to the defendants examining the books and vouchers in respect to those renewals and repairs and at the same time in relation to construction account, which would show additions to construction since 1884, and also repairs and renewels since 1884. That would not apply to vouchers in relation to the operating cost of gas in each year since 1884, because he has put in no such exhibit and an investigation of previous years would be valueless in any event.

I think that covers all the requests of the defendants and covers them substantially except for the examination of some other year from 1900 to 1905 besides the year 1905.

The MASTER: Does that cover the question of the examination of the books of the six companies which united in 1884?

Mr. MATHEWSON: Yes, if counsel desire to examine them. I think the Master will see at once, if we went into the question of operating cost of gas for another year than 1905, considering the time it has taken us to cover that year, it would be out of the question to finish in a reasonable time, aside from the relevancy of the question.

I want to say that the vouchers for the year 1905 alone, which we have said we will submit to the defendants if they desire, would probably make a solid stack comprised in drawers three feet
2917 deep and eight or ten feet high covering the whole end of this
room, and if the defendants were to examine every one of these vouchers, I do not believe they could do it, and do that alone, in the time which is left them to put in their case here. And I call their attention to this because it is an utter impossibility to go over all these vouchers for 1905 and upon these construction, renewal and repair accounts back to 1884, in any time at the disposition of the defendants, and I suggest that they must make their choice as to which and where they desire to test. I call their attention to it now, so there may be no mistake or misunderstanding about that.

The MASTER: That seems to cover everything except this question of the examination of some particular year between 1900 and 1905.

Mr. BURR: In the absence of Mr. Kirby, I call the Master's attention to what Mr. Kirby said:

"The State, specifically, at this time, desires permission to examine all books and documents of any kind, going to make up the statements set forth in any of the exhibits of the complainant and especially in reference to Exhibit 94 and the exhibit relating to repairs and renewals from 1884 to the present."

The MASTER: Well, Mr. Mathewson's statement here covers the only two matters as to which Mr. Kirby has made himself sufficiently explicit to comply with the understanding we have of this matter, that is, Exhibit 94 and the exhibit relating to renewals and repairs from 1884 to the present. I think if he wants anything more specific than that, he will have to set it forth. He says, "All books and documents of any kind going to make up the statements set forth
2918 in any of the exhibits of the complainant." That is a pretty
broad order. Some of them have been made the subject of investigation and some of them Mr. Mathewson will no doubt concede and some of them he may object to; and until Mr. Kirby makes it a little more clear what he is driving at, I think we will have to suspend decision on that.

Mr. BURR: I wanted to call the Master's attention to the memorandum of Judge Lacombe on pages 2742 and 2743 of the record, in which he speaks of having come to the City to pass upon an application for the examination of the books in the latter part of August. That I wish to be understood was not an appliaction made by the City. It was an application made by the State for a modification of the injunction made by Judge Lacombe so that the State Commission of Gas and Electricity might have the power under the law bringing them into existence to call for the production of the Consolidated Gas Company's books, but inasmuch as that very law itself is called into question here as being unconstitutional, I advised that in my judgment that could not bring us very much relief, and as I understood, Senator Page agreed with that view and the motion was then withdrawn. But I did not wish it to appear that I was party to a motion which was not acted upon at that time.

Mr. Mathewson: I want to say, Mr. Master and Mr. Burr, that in conceding the examination of the construction account and the renewals and repairs account back to 1884, so far as you may decide to test it, I want it distinctly understood that the complainant's position is that the present property that we have and the present value of the property that we have is the capital upon which we are 2919 entitled to return and not any original cost; and in making this concession I do not wish to be taken as conceding any other theory.

Mr. Burr: I do not understand the concession to mean that. I will move now before the Master that he make a direction that the complainant permit the examination to the full extent for which it has been applied by us.

Mr. Mathewson: I do not think that that is quite appropriate now, considering that we have conceded that much.

Mr. Burr: You have refused, for instance, a comparison with the other years.

The Master: I will pass on that. As I understand, that is the only thing that is left that is not covered by Mr. Mathewson's concession, and if there is any trouble in getting what you want, you may bring it to my attention.

Now, with regard to that second branch of your motion, that is, taking out some other year between 1900 and 1905, I do not see, as at present advised, what the materiality or relevancy or benefit of that will be. I can see, possibly, that it might gratify an expert, who was getting up a theory covering his views of this matter, to have some other year taken out for the purpose of comparison or argument, if the results happened to show his way; but unless it is made a little more clear to me exactly how deductions based on the business of that proposed year between 1900 and 1905 are material, I should be inclined to think Mr. Mathewson's objections was well taken.

Mr. Burr: Then I will reserve the right to make further application as the examination develops.

2920 **The Master**: Yes, and if you can amplify that at some future time and show me that it is necessary for the proper presentation of your case to have some such investigation as that, you are entirely at liberty to make the application; but as now advised, I think you are getting all that is necessary.

At 3.40 P. M. adjourned to October 15th, 1906, at 11 o'clock A. M.

Last Exhibits:

Complainant's 256,
State's W,
City's 54.

2921 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *October* 15, 1906.

Met pursuant to adjournment.

Present, The Master, Mr. Garver, Mr. Page, Mr. Burr and Mr. Kirby.

2922 MR. BURR: Mr. Master, pursuant to the right reserved by me and allowed by the Master, I make the following additional objections and motions to strike out, on behalf of the City of New York, to the Exhibits introduced in behalf of the Complainant and numbered 101 to 215, both inclusive.

Generally, the objections are as follows and I will state them then more in detail.

The City objects to the reception of papers offered by the Complainant as grants or franchises under which it claims its rights to operate in the streets of New York on the ground:

First, that the said papers are not legally executed or properly acknowledged.

Second, that there is no proof that the assignments by the companies were authorized by the Board of Directors of such companies or by the City authorities.

Third, such assignments were made without the consent of the City and contrary to law.

Fourth, the time fixed to operate under the alleged franchises or permits has expired.

Fifth, the terms, conditions and requirements under which such alleged franchises and permits were obtained have not been complied with.

Sixth, such franchises or the valuation placed upon them should not be charged against the cost of the manufacture and distribution of gas.

Seventh, there is no proof of the identity of the persons signing the assignment under Chapter 944 of the Laws of 1871.

Eighth, the valuation arbitrarily fixed on the alleged franchises of the constituent companies at the time of the consolidation in 1884 is not binding on this Court in 1905, and should not be considered as a factor to add in any manner or in the slightest degree to the cost charged against the manufacture and distribution of gas 2923 in New York, against the City of New York or any other consumer.

Ninth, that said assignments are mutilated and interlined without the same being noted and the names of assignees and assignors have in many instances been changed.

Tenth, there is no proof that the companies to which said alleged franchises or permits were granted, ever operated under them or ever laid mains in the streets under said alleged franchises, or if they did, it does not appear in what territory or to what extent, and it does not appear what rights in the particular streets of the City are claimed under the particular franchises offered in evidence.

Some of the objections and motions go to the merits of this controversy, and the Master is urged to give them mature consideration and not to overrule them as having been made simply for the record. Others may seem technical. They go to the method of proof. They are nevertheless important.

The City's position is that certain extraordinary rights and privileges, some of which were granted without its consent, are now sought to be proved against it, and if proved here may hereafter become *res adjudicata,* although this is not conceded. The genuineness and validity of such hostile rights should be proved in the strictest manner known to the law of evidence, and should not be held to prove themselves without the production of any witness. The City, in taking this position, does not seek to embarrass the Complainant unduly. Many of the witnesses to the transactions mentioned in the Exhibits are still living and available, and the City is informed that many of them have actually been interviewed on behalf of the Complainant. All such witnesses should be produced by the Complainant and the City should be allowed the fullest opportunity for cross-examination. 2924

Exhibit 188 (page 648) purporting to be an agreement between William Foster, Jr., and others and the Union Gas Light Company under date of February 25th, 1874, and in and by which the parties of the first part attempted and purported to delegate to the Union Gas Light Company all the power of the parties of the first part as the Executive Committee under the Act of 1871, to manage and control the gas making business, the right to carry on which was conferred upon such Executive Committee by said Act, is objected to on the ground that said Act of 1871, Chapter 944, was an Act to authorize certain *individuals* there in named and their assigns, acting through certain of their number, not less than seven, composing an Executive Committee, to carry on a gas making business and to use certain portions of the City of New York for that purpose, the intention of the Act (assuming that it was not a fraud upon the City of New York) being that the actual active management and control of the business should be in the hands of said Executive Committee and not to be delegated by them to any *corporation,* and that said Committee might thus be free from the restrictions and limitations placed upon gas corporations by the general statutes of the State of New York.

In the case of individuals conducting a gas making business without a State franchise, there would be no right to use the streets of the City of New York for the purposes of distribution even with the consent of the municipal authorities. Instead of carrying out the purposes of the Act as above set forth and clearly appearing upon the face of the Act, it appears from the exhibits offered in evidence that William M. Tweed and his associates secured the individual interests

of certain of the grantees (misnamed incorporators) under
2925 the Act, and instead of organizing and conducting a gas
making business, proceeded to sell (at a profit, presumably)
the interests thus acquired.

Section 1 of the Act of 1871, page 488 of Exhibits says: "And also the said persons and their assigns shall so conduct *their* manufacture * * * of gas * * * The rights and privileges hereby granted are exclusive; but shall not be construed to affect or impair any exclusive rights or privileges, if any, vested in any *incorporated company* in said city."

The Act does not provide for incorporation or create a corporation. Throughout it refers to *individuals*.

No corporation became an "assign" of any of the grantees, every assignment of any individual interest being to another individual. No corporation ever received an interest in the grant except as the agent of the Executive Committee. The word "assigns" is used in the Act only for the purpose of enabling the individual grantees to have perpetual succession.

All of the exhibits relating to the said statute, Chapter 944 of the Laws of 1871 and the Act itself, Exhibits 119 and 215, both inclusive, are objected to on the ground that it appears from those exhibits that the legal title to said State grant, if the same still exists to-day, is not vested to-day in the complainant, but in the last assignees of the individual interests of the grantees named in the Act, namely: Oswald Ottendorfer, Charles G. Francklyn, Philip Allen, Henry Day, Harrison E. Gawtry, S. C. Thompson and Peter Gardner, the assignments to whom are all dated in March, 1886, there being no proof of any transfer to the complainant or any one else of their individual interest, and the assignments to them purporting to transfer to them absolutely the rights and interests of all the original
grantees. (Exhibits 208 to 214, both inclusive.)

2926 The MASTER: You mean there is no proof of assignment
by Ottendorfer and associates to that gas company?

Mr. BURR: Yes. The only interests under Chapter 944 of the Laws of 1871 passing to the complainant in this action as shown by the exhibits offered in evidence, consists of such interests as the Complainant may have received from the Knickerbocker Gas-light Co. under the consolidation agreement of November 11, 1884, and as to this, objection is here made as follows:

First. The Act of 1884, under the authority of which said agreement was made, conferred no right on the Knickerbocker Gas-light Co. to transfer to the Complainant any *municipal* franchise which it might then have possessed or controlled.

Second. No *municipal* franchise held or controlled by a gas lighting company, organized either under the Gas Company's Act of 1848 or the General Manufacturing Companies' Act of 1848 was assignable in 1884 without express sanction of the Legislature, and at that time no such sanction had been given by the Legislature.

Third. The only interest in the said State grant of 1871, Chapter 944, held or controlled by the Knickerbocker Gaslight Company was a right to exercise said grant as the agent and attorney of the Executive Committee under the said Act (see Exhibit 198, page

678), and such right was never acquired by the Knickerbocker Gaslight Company for the reason that the Executive Committee, even if legally chosen, had, as above stated, no power to delegate such right to the Knickerbocker Company, and even if such right had been delegated to the Knickerbocker Company, that company could not (under the terms of Exhibit 198, page 678) delegate the same to the Complainant without the express consent of Messrs. 2927 Ottendorfer, Francklyn, Allen, Day, Gawtry, Thompson and Gardner, and there is no proof in this case that those gentlemen ever consented to such delegation by the Knickerbocker Company to the Consolidated Gas Company.

Objection is made to all of said Exhibits from 101 to 215, both inclusive, on the ground that they purport to show, if anything, certain rights or privileges at one time claimed to be owned by the companies which consolidated in November, 1884, to form the Consolidated Gas Company, and all of such exhibits tend to prove no municipal franchise to-day owned by the Consolidated Gas Company, unless they may be held to have been legally and properly transferred to that Company by the consolidation agreement of November 11, 1884, and the Act of 1884 pursuant to which said agreement was made, conferred no right upon any of the constituent companies to transfer or delegate to the Consolidated Gas Company any municipal franchise. And further, that on November 11, 1884, when the Complainant claims to have received the municipal franchises, if any, of the said constituent companies, such franchises were not by law assignable, without the express authority of the Legislature, and no such authority had then been given by general act or otherwise.

The meaning of the word "franchise" as used in said Act of 1884 and in the general Acts relative to the consolidation of corporations has reference merely to the franchise to be a corporation received from the State and does not include any consent by any municipality to the use of any of the streets of that municipality. The franchises, if any, of the constituent companies were granted to them for the avowed purpose of creating healthy competition, and from this point of view ceased to exist upon the consolidation of the constituent companies which destroyed the very purpose of creating them.

2928 The MASTER: What would be the object of passing the Act of 1884 if the companies could not consolidate under it with their franchise?

Mr. BURR: They should have obtained the consent of the local authorities, we contend.

All of said Exhibits No. 101 to 215, both inclusive, are further objected to on the ground, that even if they do tend to establish in the Complainant any municipal franchises as against the City of New York, the said Exhibits are immaterial and irrelevant, as such franchises, if any, cannot be taken in this proceeding as part of the property used in the gas making business upon the value of which the Complainant is entitled to a return as against the consumers' supplied by the Complainant.

Objection is further made to Exhibit 101, (Page 421) purporting to be a grant of certain rights to the New York Gas-light Company on the ground that said grant was made in the year 1823 for the term of only thirty years and has therefore by its express terms expired.

Objection is further made to Exhibit 102 (page 427), purporting to be a grant of certain rights to the Manhattan Gas-light Company, on the ground that the said Exhibit is dated in the year 1848 and was for the term of only thirty years and has by its express terms expired.

Objection is further made to Exhibit 103, (page 434) purporting to be a grant of certain rights to the Manhattan Gas-light Company, on the ground that such grants purports to have been made in the year 1833 and by its express terms expired on May 12, 1853.

Objection is further made to Exhibit 104, (page 439) purporting to show grants of certain rights to the Harlem Gas-light Company, on the ground that said grants do not tend to show any rights in the Complainant. Even if a gas corporation in 1884 had the 2929 power to assign its municipal franchises, and even if the Harlem Gas-light Company did attempt to assign to the Consolidated Gas Company any rights it may have possessed under the grants shown in Exhibit 104, such assignment passed nothing to the Consolidated Gas Company because the said grants were not to the Harlem Gas-light Company and its assigns, but were intended to be used only by that Company. A municipal franchise to a particular gas corporation made prior to 1884 (even if assignable) was similar to a deed of real estate under the common law made to A. B., but not to his heirs and assigns forever. A. B., under such a deed in the absence of statute, received merely a life interest, and he could convey, if anything, only his life interest. If this analogy be correct, and even assuming that the Harlem Gas-light Company received more than a privilege to be used only by itself, and that it did assign what it had to the Consolidated Company in 1884, nothing passed to the Consolidated Gas Company beyond the mere right to exercise the privileges shown by Exhibit 104 during the corporate existence of the Harlem Gas-light Company, which term of existence has already expired.

Objection is further made to Exhibit 105 (page 444), purporting to be a grant or permission to the Metropolitan Gaslight Company and not to its assigns, on the same grounds specified in the objections to the grant to the Harlem Gaslight Company, and on the further ground that said permission was for the period of only 30 years, and having been granted in 1858 has already expired.

Objection is further made to Exhibit 118 (page 480), purporting to be a grant or permission to the Municipal Gaslight Company, on the ground that it expressly appears, in paragraph 9 thereof, 2930 on page 484 of Exhibits, that said permission should not be assigned or transferred without the previous consent of the Common Council, and there is no evidence in this case to show that such consent to the assignment of said permission to the Consolidated Gas Company, assuming that it was so assigned, was ever given; and on the further ground that said permission was in its inception invalid as beyond the authority of the municipal officials attempting to make the same, and the ordinance of August 18, 1884 (even if in evidence), in which the Board of Aldermen of the former City of New York undertook to confirm the said permission, was void under Section 86, Subdivision 5, of the Consolidated Act of 1882, then amended, and the attempted confirmation of said permission by the Legislature in Chapter 530 of the Laws of 1885, amending Subdivision 5 of Section 86, was unconstitutional in failing to express in its title that said amendatory act was designed to effect such confirmation.

Objection is also made to Exhibit 120 (page 490), purporting to be an affidavit of William Foster, Jr., made to verify and authenticate copies of affidavits of the publication of certain notices, on the following grounds:

First, the paper has no probative force of the facts therein stated, there being no proof that William Foster, Jr., is dead, or as to the circumstances under which the said affidavit was made and delivered, or that such facts (if they be facts) cannot otherwise be proved.

Second, the paper is not an affidavit, having been taken in New York County by a Notary Public for Kings County.

Third, the said paper in so far as it states that Hugh Smith was not eligible to serve on the Executive Committee as assignee of any of the original grantees under the Act of 1871 contradicts Exhibits 160 (page 585) and 144 (page 546), which tend to show 2931 that Hugh Smith did receive assignments of certain of the interests of certain grantees under said Act, and also Exhibit 180 (page 628), which tends to show that Hugh Smith was regarded as a member of the Executive Committee and resigned as such member.

Fourth, the exhibit is not admissible in the absence of proof that the original affidavits of publication cannot be produced at the present time or that proof of the publication of the notices cannot be obtained from the files of the Daily Transcript and the New York News.

Fifth, the affidavit, even assuming that it is proof of the publication of the notices in question under the Act of 1871, is inadmissible in the absence of proof tending to show that the meeting was actually held as stated in the notice, and that the Executive Committee was duly chosen at such meeting as required by the Act.

Exhibit 169 (page 606) offered as an assignment by Peter H. E. Baxter to Henry W. Genet is objected to as immaterial and irrelevant in the absence of proof that Peter H. E. Baxter therein described was the Peter H. E. Baxter, Junior, mentioned as one of the grantees named in the Act of 1871, the mere statement to that effect in the exhibit itself not being sufficient, as the admissibility of the entire exhibit is the question before the Master, and it must be proved to be connected with the Act of 1871 by evidence outside of the Exhibit itself.

Exhibit 196 (page 672) offered in evidence as a request or consent of the Union Gaslight Company and purporting to have been executed on December 11, 1876, is objected to for the reason that upon said date the said Union Gaslight Company was without 2932 power to make such instrument, a receiver of all the property and assets of said company having been appointed in 1875 as shown by Exhibit 112, page 462, of Exhibits.

Exhibit 201 (page 688) is objected to on the ground that, although it purports to be a general release from Walter Osborn and others as receivers of the Townsend Savings Bank of New Haven, it is signed by Walter Osborn and the others, not as receivers, but as individuals, and bears no notarial certificate of acknowledgment. Further there is no proof of the appointment or qualification of such receivers or that they were ever given authority to make and deliver such release. There is no proof that if they were receivers in Connecticut ancillary authority was ever given to them in this jurisdiction.

There is a total lack of proof of the execution, delivery and authenticity of Exhibit number 103 (page 434) purporting to be a grant to the Manhattan Gas-light Company; number 109 (page 454) purporting to be an assignment from the Anthracite Gas Lighting and Heating Company to the Citizens Mutual Gas Company; Number 124 (page 499) purporting to be an assignment from Isaac P. Martin to C. S. Bushnell and others, numbers 179 (page 627) 180 (page 628) 195 (page 671), 200, (page 687) and 215 (page 721), purporting to be resignations of various persons describing themselves as in the case of each said exhibit, as an Executive Committee, number 201 (page 688) purporting to be a general release from Walter Osborne and others to the Knickerbocker Gas Light Company. None of said Exhibits bear any acknowledgment before a notary public or other duly authorized official and there is no proof of any description as to the execution, delivery or authenticity of the said documents, or any of them.

2933 Similiar objection is made to numbers 115 (page 472) and 197 (page 675) purporting to be assignments executed by Charles E. Appleby, Receiver of the Union Gas Light Company, to Clark Bell. The notarial acknowledgments affixed to said exhibits are acknowledgments by said Appleby individually and not by him as such Receiver.

There is a total absence of proof of the execution, delivery and authenticity of Exhibit number 145 (page 547) purporting to be an assignment by James M. Sweeney to C. S. Bushnell. Said assignment purports to be executed in behalf of James M. Sweeny by John J. Bradley, his attorney in fact, and there is no proof of the authority of said Bradley to act as such attorney in fact, the document annexed to said exhibit and purporting to be a copy of a power of attorney from James M. Sweeny to John J. Bradley not having been proven to be a correct copy of said power of attorney, and there being no proof that said power of attorney ever existed or was duly executed. The mere certificate of Henry Parsons attached to said power of attorney is not proof of any of the facts in said certificate purporting to be stated. Further, the alleged copy is not a complete copy. There may have been provisions in it which would negative any power of Bradley to sign said exhibit in behalf of James M. Sweeny.

Similar objection is made to Exhibit 156, (page 574) purporting to be an assignment from Henry A. Smith to C. S. Bushnell and

others. The said assignment purports to have been executed in the name of Henry A. Smith by Bernard Smythe, his attorney in fact, and the authority of said Smythe to act as such attorney in fact has not been proven, the document attached to said Exhibit No. 156 and purporting to be a copy of power of attorney from Henry A.
2934 Smith to Bernard Smythe not having been proven by any
evidence to be a true copy of said power of attorney, and the existence and execution of the original thereof not having been proved or its absence accounted for. Further the alleged copy does not purport to be a complete copy.

The execution, delivery and authenticity of Exhibit 151 (page 563) have not been proved, there being no proper notarial certificate of acknowledgment of such execution, the document attached to said exhibit purporting to be such certificate of acknowledgment being without venue.

Similar objection is made to Exhibit 160 (page 585) on the ground that the document attached thereto purporting to be a notarial certificate of acknowledgment lacks any date.

Objection is made to numbers 188 (page 648) and 196 (page 672) in so far as the execution of either thereof by the Union Gas Light Company is concerned, on the ground that the document attached to each of said exhibits and purporting to be a notarial certificate, is fatally defective in failing to state that the officer who signed the corporate name to each of said exhibits signed such name and his own name as an official of said corporation by authority of the board of directors of said corporation.

Objection is made to numbers 129 (page 512), 161 (page 587) and 169 (page 606) for the reason that although each purports to be an instrument in writing under seal, the seal is absent from each of said exhibits.

Objection is also made to Exhibit 161 (page 687) on the ground that there is no proof that the official purporting to take the acknowledgment of said instrument was duly authorized to take such acknowledgment or to take the acknowledgments and proofs of deeds of lands to be recorded in the State of New York.

2935 Objection is made to Exhibit 134 (page 524) introduced
in evidence as an assignment to William M. Tweed, Jr., on the ground that said exhibit offered in evidence is not such assignment, it appearing upon the face thereof without explanation that the name "A. Oakey Hall" has been stricken out and the name "William M. Tweed, Jr." interlined in place thereof in the handwriting of William M. Tweed, Sr., and there being no proof or evidence that the said exhibit at the time of its execution was an assignment to William M. Tweed, Jr., and not to A. Oakey Hall.

Similar objection is made to Exhibit 142 (page 539), offered in evidence as an assignment of the interest of Henry Johnson, on the ground that it appears on the face of said exhibit without explanation that the name "William" has been stricken out and the name "Henry" interlined in place thereof, and there being no proof or evidence that at the time of its execution the said document was an assignment by Henry Johnson.

Similar objection is made to Exhibit 144 (page 546), offered in evidence as an assignment to James M. Sweeny, it appearing on the face of said exhibit without explanation that in one place the name "Hugh Smith" has been stricken out and the name "James M. Sweeny" interlined in place thereof, and in another place also without explanation the name "Hugh Smith" has been stricken out and the name "A. Oakey Hall" interlined in place thereof, and the name "James M. Sweeny," then interlined in pencil in place of the said name "A. Oakey Hall," the name "James M. Sweeny," in each case being in the handwriting of John J. Bradley, as appears by a comparison of said handwriting with the signature of said Bradley upon Exhibit 145 (page 550).

2936 In this connection the Master is referred to the endorsement in pencil upon the back of Exhibit 133, (page 521), namely "Chk. to J. J. Bradley;" and to the reference to Hugh Smith in Exhibit 120, page 492, purporting to be an affidavit of William Foster, Jr., and to the erasures in said affidavit of the words "eligible as such."

Attention is also called to Exhibit 180 (page 629), purporting to be the resignation of Hugh Smith as a member of the Executive Committee.

Similar objection is made to Exhibit 145 (page 547), for the reason that in what purports to be the acknowledgment of the execution of said instrument the name "William M. Bradley" has been stricken out and the name "John J. Bradley" interlined in place thereof, and the word "Nov." has been stricken out and the word "Dec." interlined in place thereof, all without explanation and without proof as to the condition of said instrument at the time of its execution.

Similar objection is made to Exhibit 156 (page 574), for the reason that in what purports to be the acknowledgment thereof, the words necessary to show that the acknowledgment was by Bernard Smythe, as Attorney in fact for Henry A. Smith," have been interlined without explanation and without proof as to the condition of said exhibit at the time of its execution.

Similar objection is made to Exhibit 160 (page 585), offered in evidence as an assignment to A. Oakley Hall, for the reason that it appears upon the face of such exhibit without explanation that the words "Hugh Smith" were stricken out and the words "A. Oakley Hall" interlined in place thereof, and there being no proof as to the condition of said exhibit at the time of its execution.

2937 In this connection attention is called to the reference to Hugh Smith, Exhibit 120 (page 492), purporting to be an affidavit of William Foster, Jr., and to the erasures in such affidavit of the words "eligible as such."

Attention is also called to Exhibit 180 (page 629), purporting to be the resignation of Hugh Smith as a member of the Executive Committee.

Similar objection is made to Exhibit 165 (page 596), for the reason that it was offered in evidence as an assignment by William Johnson, who does not purport to be one of the grantees named in Chapter 944 of the Laws of 1871, and for the further reason that the words necessary to connect the person executing said instrument with William Johnson, one of the grantees named in said Act, have been interlined in said Exhibit without explanation and without proof as to the condition of said Exhibit at the time of its execution.

Same objection is made to Exhibit 167 (page 601), offered in evidence as an assignment to Peter B. Sweeny, it appearing upon the face of said Exhibit without explanation that the name of "James M." before the name "Sweeney" was stricken out and the name "Peter B." interlined in place thereof, and on the back of said assignment the name of "James M. Sweeney" is stricken out and the name "Peter B. Sweeney" written in red pencil thereon, and there being no proof as to the condition of said Exhibit at the time of its execution.

Attention in this connection is called to Exhibit 195 (page 671), the signature of H. H. Porter thereto having been stricken out in red pencil and the word "error" written opposite thereto in red pencil.

Attention is also called to the fact that all of these Exhibits 101 to 215, both inclusive, bear upon the backs thereof numbers written in red pencil of the same color and style as was used to make the interlineations of the name of "Peter B. Sweeney" on the backs of 2938 Exhibit 167 and to strike out the signature of H. H. Porter in Exhibit 195.

On the back of Exhibit 167 and to strike out execution of H. H. Porter in Exhibit 195.

Objection is made to the following exhibits, and each of them, on the ground that there is no proper proof of the execution, delivery and authenticity of any one of them, the notarial certificate in each case stating, "Before me came —— —— to me known to be the person described in, &c.," and failing to state, "Before me came —— ——, to me personally known and known to me to be the person, &c."; 121, 122, 125; 127 to 133 both inclusive; 135 to 138, both inclusive; 140 to 145, both inclusive; 149 to 168, both inclusive; 170 to 178, both inclusive; 181 to 194, both inclusive; 197, 198; 203 to 214, both inclusive.

Objection is made to Exhibit 170 (page 607), for the reason that the notarial certificate of acknowledgment fails to state that Henry W. Genet, purporting to be the person who executed the said exhibit, was known to the Notary Public to be the same person, the words "known to me to be" being omitted from said certificate of acknowledgment.

In connection with this objection and the one preceding I refer the Master to acknowledgment on Exhibits 147 and 148, which are unquestionably in -correct form; also, to the acknowledgment on numbers 191, 194 and 206, which purport to have been taken outside of the State of New York, and in which cases certainly the Notary should have stated that the person acknowledging the instrument was personally known to him.

If these objections are overruled for any reason I move to strike out the exhibits on the grounds specified in said objections respectively.

I move to strike out all reference in the testimony to an in- 2939 vestment by the Consolidated Gas Company at Astoria, on the ground that the same is irrelevant, the evidence showing that such investment was made by **the Astoria Light, Heat & Power**

Company and that the only relation between that company and the complainant is that the complainant owns all the stock of the Astoria Company and holds certain evidences of debt issued by that company; and on the further ground that the said Astoria Light, Heat & Power Company is not shown upon this record to have any right to operate in the Borough of Manhattan, either directly or indirectly.

And in this connection I desire to call the Master's attention to the fact that it is conceded that the Consolidated Company owns a controlling interest in the stock of the New Amsterdam Company and that the latter owns all the stock of the East River Gas Company of Long Island City. But in case there should be any doubt of that I desire to quote from report of the Stevens Committee—you no doubt will concede that, won't you, Mr. Garver?

Mr. GARVER: I am not making concessions. If it is on the record it is conceded. If it is not on the record it is not conceded.

Mr. BURR: It is on the record.

The MASTER: I think you brought it out by Mr. Carter.

Mr. PAGE: I would like to join in the objections to the various exhibits and in the motions Mr. Burr has made with regard to them.

Mr. BURR: I would like to have entered upon the record about these franchises, this stipulation, if it is agreeable to counsel:

It is hereby stipulated and agreed by and between counsel for the respective parties to this action that the original of any exhibit, whether printed in the record or not printed, will be produced at any hearing or argument, provided reasonable notice be given
2940 for its production, and counsel may refer to or quote from on brief or argument any exhibit whether printed in this record or not.

No objection.

Mr. BURR: In connection with the testimony in the case already given here as to the kind of plants operated in this borough by the Consolidated Gas Company, and also in connection with the construction of the plant at Astoria, I think it important to produce before the Master, as being an official explanation of the situation as regards both those matters, the character of the plants in the Borough of Manhattan and the necessity for the Astoria plant, what appeared in the New York *Daily Tribune,* Friday, April 15, 1904, and I would ask Mr. Garver now whether this statement which is headed "To allow Gas Plants' Removal. Consolidated Gas Company declares that is purpose of Remsen East River bill," was not an official statement issued by the Company.

Mr. GARVER: I don't know as I have ever seen the statement before, but I certainly cannot concede that it was or that it is competent evidence here, or that there is any proof that it was ever made by the Company.

Mr. BURR: This purports to be a statement given out by a representative of the Consolidated Gas Company in view of the persistent misrepresentations, as to the purpose and effect of the so-called East River gas bill.

Mr. GARVER: I object to your reading anything from newspapers.

Mr. BURR: If you like I will read it, and if we cannot prove it we will have it stricken out.

Mr. Garver: I object to it as irrelevant and incompetent and mere hearsay.

The Master: You can offer it, Mr. Burr, if you like, and I 2941 will exclude it, and it will be printed as an excluded exhibit and you will have it in the record.

Mr. Burr: All right, sir. I offer it.

Received in evidence and marked City's Exhibit 55.

Mr. Burr: City's Exhibit 55 is as follows:

"The following statement was given out by a representative of the Consolidated Gas Company yesterday:

"In view of the persistent misrepresentations as to the purposes and effect of the so-called East River Gas Bill, the Company, contrary to its usual custom, has decided to make a statement on the subject. For the last ten years it has been the desire of the Gas Company, and the successive local administrations, to remove from the Island of Manhattan its fourteen gas plants, which are (under the most favorable conditions) not good neighbors, and assemble them on a single site at Astoria.

"At this point it has undertaken to make an investment of some fifteen million dollars in modern machinery and buildings. When this work was under way it was accidentally discovered that, through the neglect of an attorney some time between 1871 and 1878, to record a deed or a bill of sale, the chain of franchise title of the East River Gas Company was to that extent impaired. Since it was necessary, in making the vast improvement at Astoria effective, to use this East River franchise, the so-called Remsen East River Gas Bill was introduced in the Legislature to correct the clerical omission of the attorney. This bill was passed last year, but Mayor Low was informed by his Corporation Counsel, Mr. Rives, that the 2942 Company's title was defective, and he thereupon refused to sign the bill, notwithstanding that the avowed purpose of the bill was to correct a clerical omission.

"The Gas Company was thereupon forced into the Supreme Court, where, in mandamus proceedings, it obtained an order based on the validity of its charter, compelling the authorities to permit it to lay its mains in their city up to the new Astoria plant. The financial interests directing the vast public improvement did not wish to make an investment of this magnitude subject to court orders and so it sought affirmative legislative relief, and the Remsen Bill was again introduced and again passed.

"As the new gas station at Astoria, when completed, will be five times larger than any other in the world, and will bring together, on a new location, about 10,000 people, the citizens of Queens have been very active in assisting this matter, and have petitioned in its favor.

"In respect to modern gas manufacturing practice, New York is far behind London, Vienna, Paris and Berlin, where the authorities long since compelled the isolation of gas making plants outside the centres of population.

"The sole effect of the Remsen Gas Bill will be to facilitate and make safe the expensive work of bringing New York up to the sanitary level of these cities."—**New York Tribune, Friday, April 15th, 1904.**

Mr. Burr: Do you wish me to call your attention to any cases upon any particular points I have made, while we are here?

The Master: I shall have to have some cases if I am expected to rule on all these propositions, and I should like to 2943 have some statement of cases from the other side. I suppose as a matter of course they must have looked into some of these things before.

Mr. Garver: These motions are the technical kind that might have been made in the days of Lord Coke in an action in ejectment. Mr. Burr states that we are required to make strict proof of everything in this case. We do not understand that that is the rule at all. I do not understand that this is an action that we have brought to compel a recognition of our franchise rights, or that we are required to show that every assignment of every fractional interest has been executed and acknowledged in a precise manner to have enabled it to be recorded as a deed. There is not any such rule of evidence as that which applies to this case. They have put on their magnifying glasses here and they have subjected every page to a microscopic examination and they come in and urge these little, miserable, petty objections after the company has been doing business for more than a generation—after all those people have passed away. Now there is no rule of evidence that is better settled than that an ancient document proves itself. If a document is thirty years of age the mere production of it from the proper custodian is enough. If a document is not thirty years old, as some of these may not be yet, the very fact that a long time has elapsed certainly makes it incumbent upon the Master to take that into consideration in viewing the effect of the objections that have been made here. As I look at it, these objections are either too general, such as ought to be urged really in summing up the case, or they are too infinitesimally minute and they are all based really on the theory that we get all of our rights from the City. Now that is the greatest kind of an error and it is an error that has crept into the public press and that is shared by the 2944 community generally. It is not the fact and it is not the law.

We get our rights from the State, and the only act on the part of the City under the laws as they have existed since 1848, is the consent of the City that we shall exercise the franchise that the State has conferred upon us. Now, it is the State and it is the general law that gives a gas company that is organized under that law the right to lay and maintain mains in the streets of the City. The City has the right to consent to it but the statute does not require any formal or even written consent to our exercise of the right. That precise question has been recently passed upon by the Appellate Division in the Second Department in the case of the New York and Richmond Gas Company. That was decided in 89 App. Div. In that case they refused to recognize the right of the gas company to lay its mains and I think the proceeding was one to compel the City to grant it a permit. They did not have a scrap of paper, did not have any written consent of any kind, but that company and its predecessors had operated there for a number of years—I think perhaps fifty years; and the Court said that in a case of that kind it would be assumed that the City had consented by such long acquiescence, the consent would be presumed, and they cited a case, Jorgenson against Squire, I think in the Court of Appeals, being the case of maintaining an area-way under the sidewalk and where that existed over twenty years. The Court there held it would presume the right had been granted. And more recently, the Appellate Division in the Second Department has held that a consent would be inferred or assumed from the fact that the City entered into a contract with the gas company, that that in itself was a recognition.

Now that is all that we need to prove in this case. We are 2945 not proving down to the minute details as to what our franchises are. We do not have to; we did not have to give any proof of that fact. The mere fact that we have been operating in the streets for nearly one hundred years, with the consent of the City, and that we are getting permits from the City every day to lay and maintain our mains, and the fact that no proceedings have ever been instituted against us, raises the strongest kind of presumption and is the most persuasive sort of evidence that we do have franchise rights and that those rights are necessarily—where, as was shown, we have over eight hundred miles of mains in the City streets—of very great value. Now we don't have to come down to showing exactly what our franchise rights are. We could rest on that mere fact; the fact that we own these mains in the streets, and that we are an operating company. And their corporate existence will run along for thirty years yet and then it can be renewed merely by getting the consent of the stockholders which shows that we have franchises of very great value, and that is all that we need to show.

The issue in the present case is not whether the Consolidated Gas Company has a right to do business in the city, but it is what it shall charge for that right. In other words, the issue that they seek to raise here is necessarily presumed in this litigation, that we have rights but that those rights must be limited, that we cannot charge more than eighty cents for gas, and the Gas Commission whose order we attack in this case has necessarily passed on that because they say not the companies in general, but the Consolidated Gas Company in particular, shall charge only eighty cents; therefore they recognize affirmatively our right to operate in the streets of the city. Now a great many of these questions that have been raised as questions of evidence are not questions of evidence at all. For 2946 instance they object to those old rights away back in 1823 and 1830 and so forth on the ground that they have expired. Now that is a question that we shall argue before you when this case is submitted. We shall maintain the proposition that where the Legislature has granted to a corporation the right to lay and maintain mains, that although that right may be limited say to thirty years and although you may not be able to lay any mains after the expiration of that period, yet if your corporate existence continues the company that owns those mains has the right to manufacture and supply gas thus limited. That is merely a question of occupying the streets; that having been permitted to lay those mains, and its corporate existence with all the powers that that implies continuing, it has the right to maintain the mains. Now that is one of the propositions I do not need to argue now because it is something to take into consideration on the final hearing.

Then, too, as to the assignability of these franchises, as to whether they are assignable or not, that is purely a question to be considered, when we come to consider these assignments it can be met, but it is perfectly well settled that franchises of this kind can be assigned. Since the courts have held that franchises are property it necessarily follows that the person who owns that property can dispose of it, unless there is an express restriction or prohibition against its assignment. That was passed upon in the Broadway franchise case, People *vs.* O'Brien, 111 N. Y. That is the Jacob Sharp franchise, and there, as you remember, the Legislature repealed the charter. The company had previously mortgaged the franchise and the Court of Appeals held that that franchise was property, that it was therefore subject to mortgage and that the Legislature could not repeal it.

2947 In other words, they held that the company in spite of the fact that its corporate existence had been terminated had the right to assign the franchise that was given to it, which of course was their property, and it is being exercised to-day.

But there was a case that is directly in point, the case of Parker *vs.* Elmira, Cortlandt & Northern Railroad Company, 165 N. Y. That was a case where the old Utica Railroad Company had been given the right to charge four cents a mile and subsequently it went into the hands of a receiver and the mortgage was foreclosed. Its property was sold and it was bought in by an individual, who, of course, did not have any right to run a railroad and he transferred it to the Elmira, Cortlandt & Northern Railroad Company, the defendant in this case to which I refer, and the question came up whether that company had obtained this right. The Court of Appeals said that it had, although in the original Act it was restricted to the original railroad company it was given to that company and its assigns. That must be the law where a company owns property; unless its right to transfer that property is expressly restricted it of course has the power to assign it.

Now, all these minute objections to these particular instruments, as to whether the word "duly" or "personally," etc., are contained in the certificate of acknowledgment have absolutely faded out of existence when you consider the fact that by the consolidation of 1884, which was twenty-two years ago, the franchises of those various companies, including the Knickerbocker Company which had obtained a special grant, were vested in the Consolidated Company. Now, if A, or B, or C, or D did not transfer the very small fractional interest which he may have had in that original grant the fact that this was a matter of such general public concern and at that time it was recognized, especially by the Legislative Investigation

2948 that the franchises were transferred to the Consolidated Gas Company, if any of these persons as to whom objections has been made had not transferred his rights or duly sold his rights prior to that time, he clearly would be estopped at this late date from coming in and stating he had any rights.

Mr. Burr: I want to say just this in reply. It is quite evident all through this case and particularly from what Mr. Garver has said now, that these alleged franchises are regarded as very valuable property—nay, more property that they claim that they have a right to capitalize and that capitalization shall be a source of revenue from the consumer. Now that is a very serious proposition to the consumer of the City of New York and therefore I think they are bound to prove that right if they are going to ask the Master and this Court to say we have so many millions of dollars invested in these franchises, they represent so much property——

The **Master**: So far as you are concerned, Mr. Burr, representing the City, are you not estopped from claiming that those franchises are not worth at least the amount for which you are now assessing them?

Mr. **Burr**: I think not, under the decisions. The fact that they are assessed or have to pay taxes is not to be taken as a recognition of their validity.

The **Master**: In other words you can tax them on the basis of so many million dollars and at the same time contend here that for the purpose of capitalization they are valueless?

Mr. **Burr**: Just as they can say "we should not be taxed at all," and that is being litigated. That does not bind us in a case of this kind.

I will call your Honor's attention to another matter: Mr. Garver says these "petty objections." I do not believe they should be characterized that way, but if they are petty it is because it is the 2949 first time these papers have seen the light of day; they have never been recorded and I do not believe they have ever been produced heretofore in any similar proceedings by this Company where the question of their validity was brought up.

Mr. **Garver**: I do not think you should make that statement. That is evidently beyond your personal knowledge.

Mr. **Burr**: I am expressing *by* belief, that so far as my knowledge goes, these papers were never produced in any proceeding before, and I know they were never recorded; and further, I believe they were never recorded because they were defectively executed.

Mr. **Garver**: They did not require to be recorded.

Mr. **Burr**: And they purport to transfer an interest in real property.

Mr. **Page**: As far as their not having been produced before is concerned, they were not produced before the Stevens Investigating Committee, I mean none of these under the Act of 1871; nor any of these assignments under that Act. The counsel for the Consolidated Gas Company stated when they had completed offering all the franchises that they offered at that time that those were all the franchises that the Consolidated Gas Company claimed to hold. And in the matter of the investigation before the Commission, merely the franchises that were put in evidence before the Stevens Committee were read in evidence. So far as recent investigations are concerned, the first time we ever knew that the Act of 1871—which was a general grant to a lot of politicians—had ever become vested in any constituent company of the Consolidated Gas Company, was when produced here.

Mr. **Garver**: We do not rely on one franchise. We rely on all the franchises we have.

2950 Mr. **Page**: Of course, if the position of the Gas Company is that they have no franchise except that which they have obtained by prescription, of course that is all right, and we will value what they have got by prescription, what it is worth, but if they claim to have some exclusive franchise or franchises which are granted to them by some authority, that is another thing. That might be worth something. We would like to know what their position is, because if they claim they have acquired rights——

Mr. Garver: I thought I had made my argument clearer than that. My point was in showing that we do not get our rights from the City, that the City merely consents and acquiesces, and therefore that we are not bound down to technical rules of evidence which apply in an action at law. We have got other franchises, for instance, the Harlem franchise that we claim to be perpetual above 79th Street, and a very valuable one, and on that alone we think a very large amount could be given as its value.

Mr. Burr: I just want to say in answer to that point that Mr. Garver has raised, with regard to the acquiescence of the City in the situation, that he may and does contend that the City has acquiesced for twenty-two years in the existence of the Consolidated Gas Company and recognized the legality of its existence by giving it permission to extend mains, contracting with it for the lighting, &c. This is immaterial because the City had to have gas and had to buy the same from this company. Up to 1904 it had no legal authority to make its own gas or light its own streets. The controversy with this complainant arose in 1903 and the City's acquiescence in the existence of the complainant was therefore involuntary. The City had no other recource and was acquiescent as if under duress.

The City is not the aggressor in this litigation. It is
2951 seeking to defend itself against the assertion of extraordinary
claims. It is not asking that the pipes in the streets be torn up. It might concede, though it concedes nothing, that the company is in the position of a licensee, and has no other rights than a mere licensee. The company's business might not be destructible without compensation, it certainly should not be held to have perpetual rights upon which it may rely for all time so as to prohibit progress in lighting except upon its own extortionate terms.

If Mr. Garver's contention is true, they have an absolute right in the streets which time cannot change and whatever change there may be in lighting, a perpetual right against the City, which is a very serious question. It may be in this action the Court may disregard these franchises as an element going towards the capitalization or increasing or enhancing the capitalization or in any way affecting the price of the manufacture and distribution of gas. It may disregard it and say, That is an issue with which we have nothing to do here. But if it does take those matters into consideration it is going to very seriously affect the City of New York in the regard as to whether these franchises are legal or not, so that I believe, therefore, that we are justified in presenting to the mind of the Master all the possible objections we have and all possible claims at this time, so that later on we may elaborate them still further in our brief.

The Master: I shall be glad to have you, and I should be glad particularly to hear what you have to say in your brief on that question of taxation. As against the city, it seems to me that is a serious question.

Mr. **Burr**: The tax you refer to is a tax levied by the State.

2952 Mr. **Garver**: No, it is not a tax levied by the State. It is like any other piece of real estate, it is assessed by the State officers but becomes part of the local real estate assessment, because they send it down here and then it is entered on the assessment books here.

Mr. **Burr**: Which tax do you refer to?

Mr. **Garver**: To the State Franchise Tax. It seems to me that is also conclusive against the State, because the State gets its share and the City assesses it.

Mr. **Burr**: The City's duties in that regard are purely clerical. The assessment of the taxes is by State officers over whom the City has no control.

The **Master**: Well, for the purpose of this litigation, as the State and City are both parties, I do not suppose there is any particular significance in that distinction. We have got them all here, and they all have to defend their rights.

Mr. **Burr**: In view of the absence of Mr. Mathewson at the Court of Appeals, I have arranged with him not to produce Professor Bemis until to-morrow morning when Mr. Mathewson returns, and I will then be ready to proceed with Professor Bemis.

Adjourned to Tuesday, October 16, 1906, at Eleven o'clock A. M.

State's W,
City's 55.

2953 United States of America,
Southern District of New York, ss:

I, John A. Shields, Clerk of the Circuit Court of the United States of America, for the Southern District of New York, in the Second Circuit, do hereby Certify that the foregoing (Vol. 4) pages, numbered from 2249 to 2952 inclusive, contain a true and complete transcript of the record and proceedings had in said Court, in the cause entitled Consolidated Gas Company, Complainant, Appellee, against Julius M. Mayer, as Attorney General, *et al.*, Defendants-Appellants, as the same remain of record and on file in my office (Vol. 4)

In Testimony Whereof, I have caused the seal of the said Court to be hereunto affixed, at the City of New York, in the Southern District of New York, in the Second Circuit, this 15th day of May, in the year of our Lord One Thousand Nine Hundred and eight and of the Independence of the said United States the One Hundred and thirty-second.

[Seal of U. S. Circuit Court, South Dist. New York.]

JNO. A. SHIELDS, *Clerk.*

[Endorsed:] United States Circuit Court of Appeals for the Second Circuit. —— —— *vs.* —— ——. Transcript of Record from the Circuit Court of the United States for the Southern District of New York.

2953½ Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York, WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *October* 16, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr and Mr. Kirby.

U. S. Circuit Court, Southern District, N. Y. Filed Jun- 24, 1907.
[SEAL.] JOHN A. SHIELDS, *Clerk.*

2954 EDWARD W. BEMIS, a witness called on behalf of the city, being first duly sworn, testified as follows:

Direct-examination by Mr. BURR:

Q. What is your age?
A. 46.
Q. Are you a graduate of any institution of learning?
A. Yes; Amherst in 1880 and the Johns Hopkins University, where I received the degree of Doctor of Philosophy in 1885.
Q. Have you made a study of the gas question?
A. Yes.
Q. When did you begin to make a study of that question?
A. About 1889, when I was in charge of Economics at the Vanderbilt University at Nashville, Tenn. I took an interest in the special study of municipal gas works at that time and visited the various municipal plants then in operation in this country, and finally prepared a monograph at the request of the American Economic Association, which they published.
Q. Upon what subjects?
A. Upon Municipal Gas in the United States. That was published about 1891.
Q. What have you written on the subject?
A. In 1897 I prepared a report for the Special Bureau of Labor Statistics of Illinois, upon the Gas and Street Railway situation in Chicago, making a study of the franchises and the cost of manufacture and distribution of gas, and, generally, a history of those two problems in Chicago. Then in 1899 T. Y. Crowell & Co. published a book on Municipal Monopolies, which I edited. I wrote the chapter on gas and about half of the other chapters; and I have written

a good deal at different times in the magazines and papers, periodicals, etc., on the subject.

Q. Now have you appeared and given testimony in the 2955 courts before Commissions upon this subject, and if so please state where and when?

A. I appeared before the United States Court at Des Moines, Iowa, about 1893. I think I appeared first about 1892 and again in 1893, or 1894, before the same court. Then I subsequently have appeared before many different tribunals. I have appeared before the Massachusetts State Gas Commission in the case of the Springfield, Haverhill and Boston gas companies, and before the New York State Gas Commission in this Consolidated case a year ago, and have appeared also before the same State Gas Commission in the Syracuse case last spring.

Q. That is, you appeared before the State——

A. The New York State Gas Commission. I appeared before a State court in Baltimore last spring with reference to a gas case in Baltimore. I appeared before the Chicago City Council last winter. I also prepared a report for the Montreal City Council.

Q. What was the occasion of your appearance before the Chicago City Council?

A. The question of a proper price of gas was being considered by the city, and they called upon several to appear before them and give evidence. I was one.

Q. And you say you prepared a report for Toronto?

A. No; the City of Montreal; at the request of the City Council.

Q. Upon what subject?

A. That was on a proposed municipal gas plant. The cost of the plant and its operation. Then I have had occasion to make a good deal of study of the gas question within the last year or two in connection with the National Civic Federation, which created a committee of twenty-one to make an investigation of municipal, as compared with private, gas and electric light and street railway and water works, here and abroad. They created a special committee of five, of which I happened to be a member, and which had the 2956 direction of the work and the hiring of the experts; and they have been in Europe—were in Europe——

Q. Who, the experts or the committee?

A. Both. We were in Europe together during the spring. And then there was created a special committee of four to analyze the results of this investigation in America and in Europe, and I am one of that committee.

Q. And you are engaged on that work now?

A. Yes.

Q. While in Europe, while a member of that committee to which you referred, did you visit the gas plants there and electric light plants?

A. I visited them in Great Britain. We did not go on the Continent for that purpose.

Q. Have you visited gas plants in America to any extent?

A. Yes; I have visited a great many; and I may say visited gas works in Great Britain in 1900 also, when I was over there on another occasion, not connected with that directly.

Q. In what cities in the United States have you visited gas plants?

A. Boston, Worcester, Lowell, Haverhill, Springfield, Holyoke; and, further west, in Syracuse, Cleveland, Toronto, Chicago, Cincinnati, Baltimore, Philadelphia. I suppose there are a good many others, but those are some of the larger ones. I know I have visited the municipal plants. All of those I have visited a good many times—Richmond, for example, and Hamilton and Wheeling, etc.; a good many small works, Duluth.

Q. You are now and have been for some time in the employ of the City of New York as an expert in this matter of the Consolidated Gas Company?

A. Yes.

Q. And in connection with the general lighting situation which exists between the city and the various gas and electric light companies?

A. Yes.

2957 Q. Have you made a study of the testimony in this case, and if so you may state exactly what you have done in connection with this case and prior investigations regarding the Consolidated Gas——

A. Well, I prepared myself by a review of the evidence taken in all the previous hearings which I had already read at previous times, such as the two reports made in 1885 and 1886, to the New York State Senate; and the Stevens report and evidence and exhibits; and the evidence taken before the New York State Gas Commission in this case, and the exhibits and evidence in this case.

Q. And the exhibits before the Gas Commission?

A. Yes, that's right. And I have made special studies of such facts as I could gather in the files of the Massachusetts Gas Commission.

Q. Now, you have heard or read all the testimony in this case?

A. Yes.

Q. And you have made a study of all the exhibits in this case?

A. Yes.

Q. Which exhibit do you desire to take up first for your consideration now?

A. Exhibit 93 and Exhibit 94 more particularly; Exhibit 93 at first, and also a more detailed analysis of that exhibit which appears as Exhibit 145 in the printed testimony before the State Gas Commission of this State.

Q. Now, do Exhibit 93 and Exhibit 94 divide the cost of gas to the Consolidated Gas Company?

A. The Exhibit 93 refers to the twelve months ending October 31st, and Exhibit 94 is for the calendar year 1905—the other for the year, I said, ending October 31st, and each of them divide the cost into the cost at the holders or the manufacturing cost, and other costs which the company itself divides into Distribution, and General Cost and Fixed Charges.

2958 By Mr. MATHEWSON:

Q. Referred to as "Station Cost" in the exhibit?

A. I think it is. And these fixed charges. That is one of the four. The last was "Fixed Charges."

Mr. BURR: I want to offer in evidence—I do not think it is in evidence yet—Exhibit 145 before the Gas Commission. It is the statement purporting to be "A Statement of Summary of Operations for the Nominal Year Ending October 31st, 1905, All Stations," offered by the Consolidated Gas Company of New York in the proceedings before the Gas Commission, and appearing upon page 2112——

Mr. MATHEWSON: It was not offered by the Consolidated Gas Company.

Mr. BURR: It was not?

Mr. MATHEWSON: No. It was prepared at the request of the Commission, at the request of Professor Bemis, and submitted by the complainant in the proceeding before the Gas Commission.

Mr. BURR: Well, it is an exhibit in the proceedings there?

Mr. MATHEWSON: Oh, yes, if it so appears in the record.

Mr. BURR: Yes.

The WITNESS: It was prepared by the Consolidated Gas Company, as I understood it.

Mr. BURR: I offer it in evidence, commencing at page 2112 and ending at the bottom of page 2135.

Received in evidence and marked City's Exhibit 56.

Q. How do Exhibits 93 and 94 divide the cost?

A. They divide the cost between station costs and all the other costs which the company divides into Distribution, General and Fixed Charges. 2959

Q. Exhibit 93 gives——

A. That gives the so-called operating cost as 72.12 cents, and Exhibit 94 gives it as 74.81 cents. That exhibit was for a later period, you see, covering the calendar year of 1905.

Q. Well, in each case is there a division between the cost at the holders?

A. Yes, I think that is very properly made between the cost at the holders or the station, commonly known as the manufacturing cost, and all the other costs, which, as I have said, the company divides into Distribution, General and Fixed Charges.

Q. What did you do with the interest charges?

A. They are no- an operating cost; they are an interest on indebtedness and are in the nature of a return on capital and should be eliminated from the study of operating cost.

Q. What did you do with the consumers' deposits?

A. The same remark applies to those.

Q. Now, will you describe what these two items are in Exhibits 93 and 94?

A. Yes. In Exhibit 93 the fixed charges are 7.04 cents and the interest on consumers' deposits is——

Q. Excuse me. You can get it in a little more accurately?

A. Yes. Here is a table which I prepared for the stenographer, as follows:

TABLE 1.

Elimination of Return on Capital.

Description.	Ex. 93.	Ex. 94.
Fixed Charges	7.04c.	7.32c.
Interest on consumers' deposits	0.40	0.39
Total return on capital	7.44	7.71
Total operating cost as given by company	72.12	74.81
Operating cost as corrected above	64.68	67.10

2960 Q. The table you have prepared is in three columns, headed, "Description, Exhibit 93, Exhibit 94"?

A. Yes. "Elimination of Return on Capital" is the heading of the paper.

Q. Under the heading of "Description" you have "Fixed Charges"?

A. Yes.

Q. Under "Exhibit 93" that appears to be 7.04 cents?

A. Yes.

Q. Under the heading of "Exhibit 94" it is 7.32 cents?

A. That's right.

Q. The next item is "Interest on Consumers' Deposits" and under "Exhibit 93" is 0.40?

A. Yes.

Q. And under "Exhibit 94" you have 0.39 cents?

A. Yes.

Q. The "Total Return on Capital" under "Exhibit 93" is 7.44 and under "Exhibit 94" it is 7.71 cents?

A. Yes, sir.

Q. The "Total Operating Cost as Given by Company" is under "Exhibit 93" 72.12 cents and the total under "Exhibit 94" for the same item is 74.81?

A. Yes.

Q. "Operating Cost as Corrected Above," under "Exhibit 93," is 64.68 cents and under "Exhibit 94" is 67.10 cents?

A. Yes, sir.

Q. That is correct, is it?

A. Yes, sir.

Q. What was the manufacturing cost in Exhibits 93 and 94?

A. Well, I include in that, as does the company, the cost at the holders; that means cost of manufacturing and any expenses connected with it; maintenances of the holders, and so it is all the cost up to the time that the gas leaves the holder. Now this cost as given by the company was 32.84 cents in Exhibit 93, and 32.77 cents in Exhibit 94.

Q. How is it divided?

A. It was divided into gas made by the Consolidated Company and gas purchased under the agency agreement.

Q. Have you a statement showing that division?

A. I have a statement here and I will hand it to the stenographer. It is as follows:

2961 TABLE 2.

October 31, 1904-1905. January 1 to December 31, 1905.

Gas Made and Bought Under Agency Agreement.

Description	Feet, Exhibit 93.	Feet, Exhibit 94.	Cost, Ex. 93.	Cost, Ex. 94.
Gas made	10,659,909,000	10,657,810,000	32.68c.	32.42c.
Gas purchased on agency agreement	3,062,354,768	2,929,210,322	33.38c.	34.04c.
Total	13,722,263,768	13,587,020,322	32.84c.	32.77c.

2962 The WITNESS: That shows that they made, according to Exhibit 93, 10,659,909,000 feet and that the cost was 32.68 cents.

Q. Wait a moment. If you just give the statement as it is there you will get the matter clearer. This is a statement of the gas made or bought under agency agreement, October 31st, 1904, to 1905, isn't it?

A. That is a mistaken heading you have on your paper. That should be October 31st, 1904-1905, and January 1st-December 31st, 1905, for there are two periods covered. One is in Exhibit 93; the other is Exhibit 94.

Q. That statement that you have prepared is divided into five columns, is it?

A. Yes, sir.

Q. The first column is "Description"?

A. Yes.

Q. And the second column shows the feet made under Exhibit 93, the third column shows the feet made under Exhibit 94, the fourth column shows the cost under Exhibit 93 and the last column shows the cost under Exhibit 94?

A. Yes.

By Mr. MATHEWSON:

Q. That is the cost of the gas made and not the cost of that portion of the gas made which reached the consumers' meters?

A. This is per thousand cubic feet of gas made. This is not per thousand cubic feet of gas sold to the consumers.

Q. So it is not computed on the same basis as the station cost in Exhibits 93 and 94, is it? Or, is it?

A. Yes, I think so.

Q. On the same basis as in the last column in Exhibits 93 and 94?

A. Yes. This is taken directly from those exhibits.

By Mr. **Burr**:

Q. Now, have you any criticism to offer as to the station 2963 cost or cost at the holder of the gas made?

A. Yes.

Mr. **Mathewson**: If it is anything that appears on these exhibits, if the Master please, I have no objection to the witness showing a mathematical error in computation, or something of that sort, but if he proposes to criticise the inclusion of items here, or say that they are too much, or too little, I must object to that, because the witness has never operated a gas plant, he has never built a gas plant, he has never been in the gas business, and he is not an expert qualified to speak in that subject. I would like to ask the witness a question.

By Mr. **Mathewson**:

Q. Have you ever managed a gas plant?

A. No.

Q. Have you ever constructed a gas plant?

A. No.

Q. Have you ever been in the gas business?

A. No.

Mr. **Burr**: A man might understand political economy and never have run a green grocery.

Mr. **Mathewson**: He probably would not understand political economy if he had spent his life as a green grocer.

Mr. **Burr**: He would understand a good part of it

Mr. **Mathewson**: I do not know quite what the answer may bring forth, but I think in time I should register that objection, which it seems to me cannot be passed over.

By Mr. **Burr**:

Q. Mr. Bemis, whatever your testimony may be, it is based upon the result of the study which you have stated to the Master 2964 you have made on this subject, together with a careful study of all the testimony and exhibits in this case?

A. Yes, sir.

Mr. **Mathewson**: A man would not be qualified even to study, if study would qualify a man as an expert in a matter of this kind, unless he had some preliminary practical knowledge, in my judgment. But I doubt if study of practical knowledge will justify a man in appearing as an expert and saying, this is too much for this, and that is too much for that, when he never operated a plant.

Mr. **Burr**: That is something that appeals to the Master. If the Master thinks his testimony in that regard is entitled to so much weight or no weight, that is for him to say.

The **Master**: It is very difficult for me in advance of the testimony to pass on your objection with any degree of intelligence, but I am inclined to let the professor attack your tabulations and figures from the standpoint of a statistician, if you please, or an expert on the theory of gas making, and I think that——

Mr. **Burr**: And a student of gas economics.

The **Master**: And I think, as Mr. Burr says, that your objection goes in the last analysis to the question of the weight to be attached to his testimony. I may be wrong in that, but at all events, your rights are reserved; you may have the objection noted, and if it should transpire hereafter that the testimony that the professor gives is going to unduly protract the case or open up side issues, or if for any other reason it is believed by you that the examination ought not to proceed further, why, of course, you may renew the objection to strike it out and reserve your right. I think we will save time by letting him proceed and answer these general questions according to the line that he and Mr. Burr have worked out, and protecting your rights subsequently, as may be. 2965

Mr. **Mathewson**: I shall take an exception, if you please. And in order not to take time or embarrass the witness, may it be understood that this objection shall apply to all the testimony of this witness which deals with other than the mere statistics and figures?

Mr. **Burr**: Before I make any comment upon that suggestion I desire to ask the Professor one question.

By Mr. **Burr**:

Q. Have you had any experience in works kindred to gas works—water works, for instance?

Mr. **Mathewson**: The question whether they are kindred is another thing. Leave out "kindred."

Q. Well, have you had any experience in water works?

A. For five years and now I have been and am superintendent of the Cleveland, Ohio, Water Works.

Mr. **Mathewson**: Do I understand, then, my objection applies to not only this but subsequent testimony here?

The **Master**: Yes. It is not necessary for you to repeat the objection each time. Now you may proceed.

Q. What do you wish to take up first?

A. Very briefly I wish to refer to the purchase and handling of coal, coke and oil, &c.

Q. Have you itemized those matters in a schedule prepared by you?

A. I have. Here is the statement.

2966 By the **Master**:

Q. What is this supposed to be? A mere rearrangement of the figures contained in these exhibits, or some independent conclusion you have arrived at? And if so, what is the nature of that conclusion?

A. This is a rearrangement merely of what is in the exhibts thus far.

By Mr. **Burr**:

Q. All taken from the exhibits in this case?

A. Yes, sir.

Mr. Burr: And all rearranged as he thinks they should be?

The Witness: The statement is as follows:

Table 3.

Cartage and Labor of Handling.

Description.	Cost. Exhibit 93.	Cost. Exhibit 94.	Ex. 93. Cost per 1,000 ft. made.	Ex. 94. Cost per 1,000 ft. made.
Coal, cartage	$18,250 48	$18,222.89	.17c.	.17c.
Coal, labor handling	50,506.25	49,150.07	.48	.46
Coke, cartage	12,360.66	11,164.97	.12	.10
Coke, labor handling	36,694.71	35,678.39	.34	.34
Coke used, cartage	43.87	43.87		
Coke used, labor	1,473.08	1,293.31	.01	.01
Oil, cartage	17,830.15	17,123.60	.17	.16
Total cartage and labor handling	$137,159.20	$132,677.10	$1.29	$1.24

2967 By Mr. Mathewson:

Q. This item of handling, that refers to coal only?

A. No, as it appears, coal, coke and oil.

Q. Do you call that table three?

A. I have not specified it, but you might call it table three.

Q. And the others are tables one and two?

A. Yes.

By Mr. Burr:

Q. What interpretation do you put upon this cost?

A. It is high. It indicates either bad management, or what is more likely that some of the works are poorly situated, being separated from the water by streets, or not possessed of proper conveyors. Their Astoria plant should be operated nearly one cent cheaper per thousand feet in these respects.

Q. You say that is shown by an expenditure of $132,677.10 as shown in Exhibit 94 or 24 cents per thousand feet of gas made?

A. Yes.

Q. For the handling of coal, coke and oil at the works?

A. Yes.

Q. Entirely apart from the delivery of coke?

A. Yes. That is higher than in good works properly situated.

Q. In this case the delivery of coke is managed by a subsidiary company?

A. Yes, so that this does not include the cost of delivering coke to consumers as is the case in many companies.

Mr. Mathewson: Of course, I suppose the Master and counsel understand that I am objecting to this testimony under that general objection just the same.

The Master: Yes, I understand, it is taken subject to that objection.

Mr. **Mathewson**: I cannot think that the witness is competent to testify to these things, as he has not had practical knowledge.

2968 Q. What is the next point you wish to take up in this connection in the station costs?

A. In connection with the station costs, it is the excess of those costs over those of other gas companies affiliated with the Consolidated Gas Company doing business in the same City of New York and paying substantially the same prices for coal and oil and presumably for labor.

Q. Have you made any comparisons with other plants in the city?

A. Yes.

Q. State what results you arrived at.

By Mr. **Mathewson**:

Q. Let me ask you where you got the data with reference to these other plants? It is not in evidence in this case.

Mr. **Burr**: I will produce it now. He is going on to give it.

Mr. **Mathewson**: It is not in evidence in this case.

Mr. **Burr**: I am going to offer it in this case.

The **Witness**: It is evidence that will be in this case in a moment, I suppose.

By Mr. **Burr**:

Q. Between what stations have you made comparisons?

A. I first made a comparison between the water gas made at the three water gas stations of the Consolidated Gas Company, namely, the 21st, 44th and 99th Street stations.

Q. For what year?

A. For the year ending October 31st, 1905, as covered by Exhibit 93, and more particularly as covered by Exhibit 145, just put in evidence from the previous case.

Q. That is, City's Exhibit 56?

2969 A. Or City's Exhibit 56 now, and compared that for the cost with the same period of time of the Standard and New Amsterdam companies.

Q. Where is the data for the 21st Street plant to be found?

A. That is to be found in Exhibit——

Q. City's Exhibit 56?

A. City's Exhibit 56, in the printed copy, the big volume, where it appears as Exhibit 145 before the Gas Commission, pages 2121-2124.

Q. And the data for the 44th Street plant is found in the same exhibit?

A. The same City's Exhibit 56 as it is now, and as it was in Exhibit 145 of the State Gas Commission—pages 2129-2131.

Q. And the data for the 99th Street plant is found in the same exhibit, is it not?

A. Same exhibit, City's Exhibit 56 in this case, but in Exhibit

145 of the printed testimony before the State Gas Commission it is pages 2132-2135.

Q. And the data for the Standard Gas Company is found where?

A. In Exhibit 23-A, page 1745 of the typewritten testimony before the State Gas Commission in the Standard Gas Case.

Q. Do you know who appeared for the Standard Gas Company before the State Gas Commission?

A. Mr. Mathewson.

Mr. **Mathewson**: Does that make it competent?

Q. Have you got the testimony here?

A. It was put in that bag.

Mr. **Mathewson**: You do not claim that evidence in any case in which I appeared as attorney is competent in any other case, do you?

Mr. **Burr**: No, but testimony was produced in that case in regard to these matters which we have the right to refer to here.

2970 The **Witness**: (Handing paper.) That is the Standard.

Mr. **Mathewson**: Can't you give us the printed pages?

Mr. **Burr**: I have not got it, and never had it. The only one I ever had a printed copy of was the Consolidated Gas Company. I would be very glad to have you supply me with a printed copy.

The **Witness**: There is a copy for the stenographer. I don't think I have but one other.

The **Master**: Where is this taken from?

Mr. **Burr**: This is one of the exhibits offered before the State Gas Commission in the matter of the inquiry in relation to the price, purity and pressure of the gas in the City of New York, in the Standard Gas Company's case.

Mr. **Mathewson**: Complaint was made before the State Gas Commission against the price charged by the Standard Gas Company a year ago and the complainants in that case offered this exhibit, which I suppose, assuming it to be and accurate transcript, was prepared by the Standard Gas Company. I don't know.

The **Master**: By whom was it prepared?

Mr. **Burr**: By the Standard Gas Company.

Mr. **Mathewson**: At the request of the complainants before the Gas Commission?

Mr. **Kirby**: Yes.

Mr. **Mathewson**: But this, I think, is only a part of the exhibit which they prepared. It is not evidence in this case, but so far as it is valuable, I do not wish to say much on that point. But I do wish to say this, that it is utterly impossible to take companies 2971 differently situated, a company with a single plant for instance, a company which furnishes a product to a limited area, and compare it cent for cent with the Consolidated Gas Company and prove by that that the Consolidated Gas Company is either too high or too low in its cost by a cent or two. The experience is that no two companies in the same city—and it has been shown in London and everywhere else—produce their gas or can produce it for the same price.

Mr. Burr: Is this going on the record?

Mr. Mathewson: I am making this as an objection to the proof and calling the attention of the Master to the reasons of my objection.

The **Master**: You offer this, do you?

Mr. Burr: Yes.

The **Master**: I will take it.

Mr. Mathewson: Exception.

The **Master**: Do you want it marked as a separate exhibit?

Mr. Burr: No, so it may be continued into the record. Mark it Table 4.

The **Master**: That is, it goes in as his testimony, but not as part of the exhibits?

Mr. Burr: Yes.

TABLE 4.

The Standard Gas Light Company. Nominal Year Ending October 31, 1905.

	Total amount.	Cost per M made.	Cost per M sold.

2973 Q. The data for the New Amsterdam Company is given where?

A. Exhibit 36, pages 234-236 of the typewritten testimony before the New York State Gas Commission in the New Amsterdam case.

Q. Did Mr. Mathewson appear for the New Amsterdam Company also, before the State Gas Commission?

A. Yes.

Q. These hearings in regard to the various companies were had at the same time the Consolidated Gas Co. was heard?

A. The cases ran along together; they would sometimes adjourn one case for a few days and take up another.

Q. Have you a copy of the exhibit in the New Amsterdam case to which you have referred?

A. Yes, I have it in my hand. But I only desire to put in evidence that part relating to the manufacturing costs for the present, and that is on the first three pages that I hand over, down as far as here (indicating). That will be table five.

IN BOOK

2977 Q. What do you claim these exhibits show, what facts do they show?

A. Those facts I have introduced in another table which I hold in my hand.

By Mr. Mathewson:

Q. Let me ask you, Professor, do these tables of the New Amsterdam and Standard companies cover the entire station cost?

A. Yes.

Q. Including the items of labor and cartage which you covered in Table 3 for the Consolidated Gas Co.?

A. I understood them to do so. This will be Table 6.

Q. I see the total is in for the New Amsterdam Co., but not for the Standard.

A. I see. I was going to explain that in my testimony. If I could have that volume dealing with the Standard——

Q. If you have the figures, supposing we put them in here, so the two will be exactly the same.

A. Well, we can add them, but they are not added in this volume,

Q. I think perhaps you had better give us the totals, and then you will have that to compare with the other exhibits.

(The totals appearing at the bottom of Table 4 were then inserted by the witness.)

The Witness: I wish to call attention to the fact that in the use that I make of the Standard table just referred to, I hold that the last three items in the second column, and for that matter, in the first column, to wit: expenses at works, holder distribution and insurance, should be added to the total a little above, which in dollars was, $751,000.76, and in cents per thousand was .2894, instead of being added as has just been done, to a figure which has been obtained by taking into account the amount billed the Consolidated Gas Company as per agency agreement. The last three should be added to this $751,000.76 instead of to that $618,153.08.

2978 In other words that should be ignored. The amount out should be ignored for the purpose I have in view, which is to find out the cost to the Standard without any refer-nce to whether it makes or loses with refer-nce to its bargain with the Consolidated Company.

By Mr. Burr:

Q. These exhibits you claim show the following facts, as appears by Tables 6 and 7?

A. Yes.

Mr. Burr: Table 6 shows as follows:

TABLE VI (6).

Consolidated Company Water Gas, October 31, 1904–5.

Station.	Feet made.	Cost.	Cost per M made.
21st Street	4,185,341,000	$1,341,188.50	32.04c.
44th Street	2,263,444,000	695,539.20	30.73c.
99th Street	1,401,538,000	420,938.42	30.03c.
Total & Av.	7,850,323,000	$2,457,666.12	31.29c.

Mr. BURR: Now the Standard and New Amsterdam Companies, Oct. 31, 1904–5, by Table 7, compiled by the Professor show:

TABLE VII (7).

Standard and New Amsterdam Companies, October 31, 1904–5.

	Feet made.	Cost.	Cost per M made. (1)
Standard Co.	2,595,111,000	$778,464.23	30.23c.
New Amsterdam Co.	5,102,082,000	1,480,195.07	29.01c.
Total & Av.	7,697,193,000	$2,258,659.30	29.34c.

2979 NOTE (1). In the exhibit the expense is given in four items: 1st, Manufacturing Cost; 2nd, Expense at Works; 3d, Holder Distribution, and 4th, Insurance. The figure in the table is the sum of these four items.

Q. What was the average cost of the water gas made by the Consolidated Company in its three stations?

A. 31.29 cents or 1.95 cents greater than the 29.34 cents, which was the cost of the New Amsterdam and Standard Companies.

Q. And should it have been even less?

A. It should——

Mr. MATHEWSON: Just a moment. Is not that almost leading? I think it is bad enough to——

Mr. BURR: Mr. Mathewson is the last one who should talk about leading in this case. His helpful suggestions have been——

Mr. MATHEWSON: Gratefully received by suffering witnesses, if you will let me complete the sentence.

Q. What is the difference, if any, in candle-power between the water gas stations of the Consolidated Gas Company and the stations of the New Amsterdam and Standard?

Mr. MATHEWSON: Does he know? Is there any evidence here that he knows?

Mr. BURR: I do not think it is right to interrupt him in this manner. If he does not know and you ask him if that is right, he can say whether it is or not.

The WITNESS: I will present soon a table showing the candle-power. I will say that the cost for the Consolidated Gas Company should have been about .82 cents less than the New Amsterdam and

Standard, instead of nearly two cents more, for the average
2980 candle-power of the five testing stations of the Consolidated
Gas Company was 22.5 during those twelve months as compared with 23.38 candle-power for the New Amsterdam and 23.73 for the Standard, as I have computed from Dr. Love's test filed in the office of Mr. Lacombe, City Engineer.

Q. What effect would that have on the cost?

A. According to Mr. Bradley's testimony, page 281, in this case and other pages near there, the Consolidated Gas Company finds one-fifth of a gallon of oil necessary for every change of a candle-power, and one-fifth of 4.08 cents, which was the average price of a gallon of oil in Exhibit 93, is .82 of a cent. Then the Consolidated Gas Company making gas of approximately one less candle-power than the New Amsterdam and Standard Companies should have made gas for .82 cents less than the cost of 29.34 of those two companies, the New Amsterdam and the Standard.

By Mr. Mathewson:

Q. All other things being equal?

A. Certainly.

By Mr. Burr:

Q. In other words, the cost should be 28.52 cents instead of 31.29?

A. Yes, a difference of 2.77 cents. This 2.77 cents multiplied into the total number of feet of water gas made at the three Consolidated stations, 7,850,323,000 feet is $217,453.95. (See p 3479.)

Q. Now, have you compared the coal gas cost of the Consolidated Company with any other New York plant?

A. Yes, I have taken the two coal gas plants, the 14th Street and 42d Street and compared them with the coal gas plant of the Central Union Gas Company for the same twelve months, ending October 21st, 1905. And I may add, that I selected that year instead of the calendar year 1905 covered by Exhibit 94, because
2981 there was no data available for these other companies, the
New Amsterdam, Standard and Central Union, later than October 31st, 1905.

Q. And is there any data for any company except the Consolidated Gas Company doing business in New York except for the——

A. No, that is right, except for the twelve months ending October 31st, 1905. That was all the testimony in evidence.

Q. Where do you get the data for the 14th Street Station?

A. That was given in this new exhibit, City's Exhibit 56, which was known in the State Gas Commission testimony as Exhibit 145, pages 2117 through to 2120 of the printed testimony.

Q. And for the 42d Street Station?

A. And for the 42d Street Station also in the new City Exhibit 56, but formerly in Exhibit 145 of the State Gas Commission testimony, pages 2125 through 2128.

Q. Where do you get the data for the Central Union?

A. That is given in Exhibit 20 of the typewritten testimony of the Central Union Gas Company.

Q. Before the Gas Commission?

A. Before the Gas Commission.

Q. Did Mr. Mathewson appear for that company?

A. Yes. And in this case likewise I wish only to copy the——

By Mr. Mathewson:

Q. Just a moment. In your water gas stations did you take more than the two water gas stations of the Consolidated Gas Company?

A. The three water gas stations of the Consolidated Gas Company.

Q. All of the water gas stations?

A. Yes. And all of the coal gas stations for the other companies. Now, for the Central Union I ask to have put in evidence page 96, being the full exhibit for coal gas.

2982 Mr. Mathewson: I have an objection to make to this Central Union statement. It does not seem to me that it is going to be profitable to go into the Central Union case, whether it is in the others or not. The Central Union operates in The Bronx, and its gas is a mixture of coal and water gas. The witness is taking the coal gas stations here in Manhattan and comparing the cost of coal gas as he takes it in The Bronx, which is enriched there by a mixture of water gas, whereas ours is enriched by oil gas and the candle-power maintained there according to the testimony, for a large part of this period, was below that required by law, and it does not seem to me that any comparison of this sort even with the allowance that the Professor will reason are proper, is a profitable comparison when you come to the cost of coal gas to the Consolidated Gas Company. There is a coal gas company, a company manufacturing coal gas in the Borough of Manhattan, which is the Mutual Gas Light Company, and I do not know how the comparison of their cost of coal gas shows up with the cost to the Consolidated Company of its coal gas, but it would seem to me if we are going into this it would be a great deal more profitable to take the Mutual Gas Light Company rather than a comparison of the kind which the witness is about to make.

Mr. Burr: I am never very much impressed by the Greek bearing gifts, and the suggestion of the other side to take one company when I have taken another does not accord with my view of the situation. I think it of the utmost importance, on the contrary, to have the Master understand the situation as it exists in the Central Union Gas Company, and if we do not, from this comparison and reasoning by analogy and comparison of figures, make out what we 2983 claim we can make out and have assumed we could make out, why, that is all a matter which you may address to the Master in your cross-examination and in your argument; but I think we should be permitted to have the oportunity to put it in.

The Master: I will take it.

Mr. Mathewson: Exception.

The Witness: May I be permitted to say that as to the Mutual which has been mentioned here, I have been through all the testimony in the Mutual case——

The Master: Never mind about that.

Q. Have you tabulated the cost of the Central Union with the 42d and the 14th Street stations?

A. Yes.

Q. What is the difference in the cost between the stations?

A. The Central Union has a cost of 19.64 per thousand feet of gas made, the 42d Street station 34.77 and the 14th Street, 37.77, so that the 44th Street station has a cost of 15 cents higher and the 14th Street station a cost of 18 cents higher, approximately.

Q. Have you got a copy of that tabulation?

A. Yes.

Table VIII. (8.)

Coal Gas.

Central Union—42nd St.—14th St.

Comparative cost in the holder of coal gas at the Central Union plant and at 14th and 42nd streets for the twelve months ending October 31, 1905, as compiled from Exhibit 20 of the Central
2984 Union Gas Company's testimony before the State Gas Commission (page 96) and Exhibit 145 (pages 2117–2120 and 2125–2128), printed copy in case of the Consolidated Company before the State Gas Commission.

	Central Union.	42nd.	14th.
Coal	30.95c.	27.12c.	26.86c.
Cartage and Labor	3.48	1.55	2.14
	34.43	28.67	29.00
Residuals	29.06	17.03	14.58
	5.37	11.54	14.42
Oil	1.27	6.54	9.00
Coke	.39		
Lime	......	23	
Oxide	.23	.22	.25

Oil, Waste, &c	.52	.06	.15
Cartage	......	.03	.17
Labor	5.89	11.52	(¹) 7.65
Repairs	4.88	2.64	3.79
Gas bt	.06		
Expense at Works	.40	.92	.69
Distribution	.28	.70	1.33
	19.64	34.74	37.70
Depreciation	......	.03	.03
Gas made 670,518,000	19.64	34.71	37.67
Cost aside from repairs	14.76	32.13	33.94
Less oil as above	1.27	6.54	9.00
	13.49	25.59	24.94

(¹) Includes 0.63c labor ($9,603.51) at 21st St. There was also spent at 21st St. on behalf of 14th St. coal $48.25 and coke $7.90.

2985 Q. What is some of the difference due to?

A. Due to the large amount of oil used by the two Consolidated Company's plants, in order, as claimed, to produce a higher candle-power. Repairs are also somewhat different in the three stations, although in that respect, more was spent upon repairs at the Central Union station than at the 14th or 42d Street stations.

Q. What did you do to make as fair a comparison as possible, and what is the result?

A. I deducted the expense for oil and repairs at the three stations so as to find out the net cost aside entirely from the enriching, and I found the net cost, as given at the bottom of Table 8, was 13.49 cents for the Central Union, 25.59 cents for the 42d Street station and 24.98 cents for the 14th Street station.

By Mr. MATHEWSON:

Q. You deducted oil and repairs in each case, did you?

A. Yes, so as to find what the cost would be with those items eliminated.

By Mr. BURR:

Q. What is the total result if the cost at the two coal gas station- *is* united?

A. If the two coal gas stations of the Consolidated Gas Company be treated as one, then their output was 2,809,586,000 feet and the average cost aside from oil and repairs was 25.26 cents or 11.77 cents more per thousand feet than the cost aside from oil and repairs at the Central Union Station.

Q. Can any of this difference, in your opinion, be accounted for by the difference in the price of coke, and if so, how much?

A. Only 1.01 cent. The price of coke is not given directly in the exhibit in the Central Union Gas case, but it is there stated that the value of the coke, 23,155,050 pounds, or, dividing by 2,000
2986 pounds, 11,577.5 tons, used in making 925,892,000 feet of water gas, was $37,381.56.

Q. What does that mean?

A. That means $3.23 per ton of coke. Now, I got that from the exhibit in the Central Union case relative to water gas which adjoined the exhibit relative to coal gas, that one figure on coke.

By Mr. MATHEWSON:

Q. Was that coke which came from the coal gas station to the water gas station?

A. Presumably.

Q. $3.20?

A. $3.23 per ton.

By Mr. BURR:

Q. What was the price obtained for coke at the 14th Street Station?

A. Right here I will stop to put in a table which will give this in better form:

TABLE 9.

Price of Coke, October 31, 1904–5.

Stations.	Difference in cost of coke per T.	Tons of coke sold.	Total am't of said difference.
14th Street	15c.	57,844.06	$8,676.61
42d Street	33c.	56,932.93	18,787.87
Total	......	....	$27,464.48

The WITNESS: Well, as I was starting to say, the price obtained for coke at 14th Street was 3.08 cents and at 42d Street 2.90 cents. Multiplying the 15 cents difference at 14th Street by the amount of coke sold and multiplying the 33 cents difference in coke at 42d Street by the amount of coke for sale, that gives a total of 2987 $27,464.48 as the increased receipts from coke that would have been obtained at the 14th Street and 42d Street stations had the price been equal to that obtained by the Central Union Company.

Q. What does this total mean?

A. This only means a difference of 1.01 cents per thousand feet distributed over the 2,809,586,000 feet made by the 14th and 42d Street stations.

Q. Is it certain that there is any difference in the price of coke?

A. No, there is no certainty that there is any difference at all. Possibly the Central Union returned the price of coke as that obtained on delivery to the consumer instead of at the works, as in the case of the Consolidated Gas Company, although I think that it is not certain in this case, since it was coke used in making water gas; but that is simply a possibility. If that be the case, and the large charge for cartage by the Central Union might seem to bear this out, then there would be practically no difference at the works in the price of coke between the Consolidated Company and the Central Union. In other words, the price of coke at the Consolidated Company's plant which appears to be a little lower, making a difference of one cent per thousand feet may be due to the fact that their prices are quoted as the sales to the National Coal & Coke Company, while if they were selling to the consumer their price might not be any different than at the Central Union plant. Yet, on the other hand, the particular coke used in this table of the Central Union Company was used right at the station for the water gas and did not require any more cartage than the coke delivered by the Consolidated Gas Company to the National Coal & Coke Company; so I do not put any stress on that, but it is only this difference of a cent anyway in the coke item, so that does not make—there is over eleven cents difference between the two stations of the Consolidated and the 2988 Central Union after eliminating all questions of oil and repairs, and the coke item does not take up more than one cent of that eleven cents.

By Mr. **Mathewson**:

Q. Let me ask a question. Instead of this Table 9 being price of coke October 31st 1904-5, it should be the difference between the price of coke which you have computed for the Central Union and the cost of coke in these two Consolidated Gas Company's stations?

A. Yes, the difference in the price of coke obtained by the Consolidated Gas Company and the cost of coke at the Central Union water gas plant, as given in the table.

By Mr. **Burr**:

Q. And this table you refer to is Table 9?

A. Yes. I would state that it might be better to introduce in evidence the statement that the figures on coke sold or used by the Central Union in making its water gas is obtained from the same exhibit which has been put in evidence, Exhibit 20, before the Gas Commission, in the Central Union case, with respect to coal gas made at its coal gas stations. But it appears in another portion of the exhibit which was not introduced into evidence directly a few minutes ago.

Q. And the figures there given are what?

A. The figures here given are in the water gas stations, coke used 23,155,050 pounds, $37,381.56.

By Mr. **Mathewson**:

Q. And the result of the division is $3.23?

A. Per ton, that is the way I made it.

Q. Long ton or short ton?

A. Short ton, 2,000 pounds.

2989 By Mr. **Burr**:

Q. What reasons are there for the difference in your opinion, between the cost of the Central Union and the two coal gas stations of the Consolidated Gas Company?

A. Table 8 which has been introduced, shows that it consists mostly of two items, the labor cost and the residuals. The labor cost at the Central Union is 5.63 cents less than at 42d Street and 1.77 cents less than at 14th Street. Just what it is in the residuals that accounts for the great difference in receipts appear because the exhibit of the Central Union Company does not analyze the residuals as do the various exhibits which have been introduced in evidence as Exhibit 56 in this case for the Consolidated Gas Company.

Q. Now, you have stated that after making due allowance for repairs and oil the Central Union Company produces coal gas at 11.77 cents per thousand cubic feet cheaper than the 14th Street and 42d Street stations?

A. Yes.

Mr. **Mathewson**: Does that take out the one cent difference for coke?

The **Witness**: No, because it was not clear that it should be taken out.

Q. What would be the total saving in dollars to the Consolidated Gas Company if it made its coal gas as cheap as the Central Union?

A. This 11.77 cents difference multiplied into the coal gas of the two Consolidated Gas Company's stations, namely, 2,809,586,000 feet is $330,687.27, which is——

Q. Does that in your opinion represent excessive cost by the Consolidated Gas Company?

A. Excessive cost by the Consolidated Gas Company. The addition of this to the excessive cost of water gas made by the Consolidated Gas Company over the cost at the Standard and New
2990 Amsterdam plants, makes a total of excessive cost of $532,440.57, or five cents per thousand feet of the gas made by the Consolidated Gas Company which was 10,657,810,000 feet.

Q. In other words, the cost to the Consolidated Gas Company for all of its gas instead of 32.68——

A. Should have been 27.68, had the company done as well as its neighbors in the City.

By Mr. **Mathewson**:

Q. Had you not better modify it, perhaps, by saying had it done as well as the Central Union and the other companies you have mentioned, because there are other companies here?

A. Yes, some of its neighbors then.

Q. Yes, those which you have compared?

A. Yes.

By Mr. **Burr**:

Q. Now, how does the price of oil compare in New York with other places?

A. It is higher than in Eastern Massachusetts——

Q. And it appears in the testimony in this case?

A. Yes. I have the Boston Gas Company here——

Q. What do they pay here——

A. The Boston Company during the twelve months ending June 30, 1906, used only——

Mr. **Mathewson**: Had you not better take the same period that you are comparing with in the other cases?

The **Witness**: I would state that the exhibit is for the year ending October 31, 1905. The evidence given is that for the year ending December 31st, 1905, and for the time since them, oil was still higher, that a contract was entered into, to take effect the 1st of No-
2991 vember, 1905, by which the price of oil was largely increased, so that the only comparison I can get from Massachusetts is the comparison just filed under oath with the Massachusetts State Gas Commission for the twelve months ending June 30, 1906, and during that period the Consolidated Gas Company's price was considerably higher than the price I am referring to here, so there is no injustice being done to the Consolidated Gas Company in any comparison I am making here.

Q. Well, I think there is, but no matter about that.

By Mr. **Burr**:

Q. What degree of oil was used at the time you speak of?

A. The Boston Gas Company used nothing but 34 degree oil.

Q. Beaume test?

A. Beaume test, and it paid only 4.01 cents therefor.

Mr. **Mathewson**: That is for the year ending when?

The **Witness**: Lowell used oil of 29 degree test and paid only 3.13 cents therefor. Lynn used 28 degree oil gravity test and paid only 3 cents a gallon.

Q. Now, if Boston had used 50 per cent. of each kind of oil, as the testimony is here that the Consolidated Gas Company has the right to do under its new contract, how much would it have paid?

A. Only 3½ cents per gallon as contrasted with an average of 4.23 cents paid by the Consolidated Gas Company in the calendar year 1905, as given in Exhibit 94.

Mr. **Mathewson**: Has a right to do. It has to use oil to produce its candle-power, and it has a right to call for certain quantities of oil.

Q. Has New York any advantage over Boston in the use
2992 of oil in your opinion, and to your knowledge?

A. I think it has three advantages. If Boston got 34 degree gravity for 4 cents, and Lynn got 28 degree gravity for 3 cents, New York should have gotten oil for less than the average of the two or 3½ cents.

Q. What are these advantages you refer to that New York possesses over Boston?

A. First, during the calendar year 1905, about five-sixths of the oil used by New York was cheaper, or 22 degree gravity oil.

Q. 28 degree, was it not?

A. 28 degree I meant to say. I am not aware that complete figures were ever given on this point, but of the 82,061,124 gallons of oil delivered from September 28, 1904, to October 31, 1905, according to pages 1628 and 1735 in the testimony in this case, only 7,257,982 gallons were of 34 degree gravity.

Q. How much of the oil in New York in 1905 was 34 degree gravity?

A. Less than 9 per cent. was of the higher gravity. During the twelve months ending October 31st, even if the two last months 50 per cent. was 34 degrees gravity, which is not testified to as true, although the company might under its contract have had that amount of the higher gravity, then the total of the better oil during the year could hardly have exceeded one-sixth of all the oil used. On that basis of five-sixths at 3 cents and one-sixth at 4 cents, the Massachusetts price, the average for the whole year should have been only 3 1-6 cents instead of 4.23 cents, even on the Boston price——

Mr. **Mathewson**: For what period?

The **Witness**: For the calendar year 1905 or for the year ending June 30, 1906, either one. It would be more strictly true for
2993 the year ending June 30, 1906, but according to the testimony in this case the Consolidated Gas Company's cost is more than

4.23 for the year ending June 30, 1906. It was 4.23 cents for the calendar year 1903, and is rising under their contract all the time, they claim.

Q. Has New York any advantage in location over Boston?

A. It certainly has an advantage in that it is nearer both the Pennsylvania and the Texas oil fields, whether by rail, water or pipe line, than Boston. It has a third advantage. It appears that some of the directors of the Consolidated Gas Company are also directors of the Standard Oil Company, which furnishes the oil——

Mr. **Mathewson**: I move to strike that out.

The **Master**: Strike it out.

Mr. **Burr**: I except.

Q. Is it in your opinion necessary for the Consolidated Gas Company to use more of the 34 degree gravity oil than the 9 per cent. actually used October 31st, 1904-5 for the production of 22.5 candle-power gas?

A. No, that is, since 22.5 candle-power was produced with the use of only 9 per cent. of 34 degree gravity oil, it seems as if it was not necessary to use more.

Q. Upon what do you base this? What reasons are there for this opinion?

A. Well, the reason for this conclusion is not only that the candle-power of the Consolidated Company averaged—well, it averaged 22 during the twelve months ending October 31st—I don't know whether it is 22 or 21½. I have one here 22 and the other 22½—I think it is 22½ during the twelve months ending October 31, 1905, when it used only 9 per cent. of the higher grade oil, but more conclusive is the fact—yes, it is 22½, I remember now. But more conclusive is the fact that the New Amsterdam Company during
2994 the same twelve months had an average candle-power, according to Mr. Love's test, of 23.38, and the Standard Company had an average of 23.73 candle-power on the same oil contract that was abrogated by the Consolidated on the ground that under it 22 candle-power could not be maintained.

Q. Did the New Amsterdam Company or the Standard Company fall below 22 candle-power during any month?

A. There wasn't a single month in the year ending October 31, 1905, in which the New Amsterdam Company fell below 22 candle-power in the average of its monthly tests, save in April, when it was 21.61. The Standard Company did not fall below 22 during any month, and during only two months was it below 22½, and only three mont-s below 23 candle-power, according to Dr. Love's test.

Q. Was there any necessity, therefore, in your opinion, for canceling the oil contract of 1905?

Mr. **Mathewson**: That is the conclusion.

The **Master**: That is a matter of argument entirely.

Q. Well, are you familiar with the testimony here with regard to the oil contract?

A. Yes. Now I have the average of the monthly tests of candle-power, which might be put in as Table 10, which is as follows:

2995

TABLE 10.

Average Monthly Test of Candle-power.

By Dr. Love, City Tester.

	New Amsterdam Co. Candle-power.	Standard Co. Candle-power.
November, 1904	22.23	22.31
December, "	22.93	22.85
January, 1905	22.73	22.00
February, "	22.51	23.57
March, "	22.18	23.05
April, "	21.61	23.00
May, "	23.10	23.55
June, "	23.21	23.97
July, "	25.61	25.79
August, "	25.46	25.47
September, "	24.78	24.63
October, "	24.22	24.60
	23.38	23.73

Q. By that table it appears?

A. It appears as I just was testifying that in the New Amsterdam Company on the same contract for oil which was abrogated in October, 1905, the New Amsterdam Company maintained more than 22 candle-power every month except April, 1905; and the Standard Company maintained 22 candle-power or more every month; and that the average of the New Amsterdam Company was 23.38 candle-power and that the average of the Standard Company was 23.73 candle-power.

Q. If oil in New York during the calendar year of 1905 had been one-half of 34 degree test and one-half of 28 degree test, what would have been its cost at the price prevailing in Eastern Massachusetts?

2996 Mr. MATHEWSON: He has testified to that, hasn't he?

A. It would have been 3½ cents.

Q. What is the difference between that price and the price actually paid in New York, according to Exhibit 94, and how much does it amount to per thousand cubic feet of gas made?

A. The difference between 3½ and 4.23, according to Exhibit 94 is 73 cents. This multiplied into 10,675,810,000 feet of gas made by the Consolidated Company, according to Exhibit 94, will give $305,699.69, which represents the minimum estimate of the excess cost of oil in New York for the gas made by the Consolidated Company, but it assumes the use of half of each grade of oil, while there was not half of each grade of oil, 34 to 28 gravity used during that year. This is equivalent to 2.87 per thousand feet of all the gas made, that is both coal and water gas. If this saving in oil be added to the excess cost of the consolidated above the New Amsterdam, Standard and Central Union Companies there is a total unnecessary excess cost to the Consolidated of 7.87 per thousand feet of gas made or $838,140.26. This is 6 per cent. on $13,969,000.

By Mr. MATHEWSON:

Q. Did you take the total amount of gas made or the total amount of gas sold?

A. The gas made, I think it is, in all this case right through. In discussing station costs up to the present time I applied it equally to gas made in all stations alike.

At 1 P. M. a recess is declared to 2:15 p. m.

2997 After Recess.

EDWARD W. BEMIS resumes the stand.

Direct-examination (continued):

By Mr. BURR:

Q. Professor, in the computations you have made in the various tables presented and introduced this morning, referring to those, were they based on the amount of gas sold, or the amount of gas made?

A. On the gas made, in all cases.

Q. Now we left off on the oil situation. How will the proposed transfer to Astoria probably affect the situation?

The MASTER: That is a little vague, is it not, Mr. Burr?

Mr. BURR: It would be, if alone, but in connection with what has gone before I do not think it is.

Mr. MATHEWSON: I suppose my objection covers this. This is rather a new departure?

The MASTER: I think so.

A. If it be argued that it is impossible to do as well as the Standard, the New Amsterdam and the Central Union Companies, as long as the somewhat inferior coal gas works at 14th and 42d Streets are used—inferior either in location or in character——

Q. Construction?

A. Construction. And there has been some testimony on both points, and if it is claimed that as long as a large percentage of water gas is used the Company is at the mercy of the Standard Oil Company, then the expected completion of the first two units of 40,000,000 cubic feet daily capacity of an up-to-date coal gas works at Astoria should involve economies sufficient to pay six per
2998 cent. on the entire investment and enable the abandonment of the 14th and 42d Street stations, as far as manufacturing is concerned, and render unnecessary more than half as much oil per thousand feet as required in the water gas. That is, to the extent to which they can substitute enriched coal gas for water gas, they will save nearly half the number of gallons of oil, because only about half as many gallons of oil per thousand feet of 22 candle-power

coal gas is required as for 22 candle-power water gas, according to the data of their own exhibits in this case. That is, the 14th and 42d Street plants as compared with the three water gas stations.

Q. Now what would the saving of 7.87 cents that you mentioned this morning in the cost for 1905 result in?

A. It would reduce the total cost from 32.42 cents on the gas made to 24.55 cents per thousand feet on the gas made.

By Mr. MATHEWSON:

Q. After how much is taken off?

A. 7.87 cents, which was the morning testimony.

By Mr. BURR:

Q. Now, if oil were obtained at 3.05 cents per gallon instead of 4.09 paid on the average by the Standard Company during the twelve months ending October 31st, 1905, or 4 cents as paid by the New Amsterdam Company during the same period, what would be the saving, if any.

Mr. MATHEWSON: For the Standard and the New Amsterdam?

Mr. BURR: Paid by the New Amsterdam.

Mr. MATHEWSON: I do not quite understand this. Has not the witness figured on what he claims would be a smaller amount of oil and at a smaller price in reaching his 7.87 cents?

2999 By Mr. MATHEWSON:

Q. That is all included there, isn't it, in the 7.87 cents saving, Professor?

A. That was only on the ten billion odd feet of gas made. I am now going to consider that they would have obtained cheaper the 2,929,210,000 feet that they got under the Agency Agreement.

Q. If the Standard and the New Amsterdam Companies had manufactured their gas cheaper?

A. Had secured all at 3½ cents instead of 4 cents or 4.09, because the same contract applied on oil to both the New Amsterdam and the Standard and the Consolidated.

Mr. BURR: That is the testimony here.

The WITNESS: And the Agency Agreement called for a price by the Consolidated based on the operating cost, plus 10 per cent., at the station, and if those operating costs were reduced by the Standard and the New Amsterdam by virtue of a lower price for oil than under the contracts that are in evidence that would have resulted in a lower price under the Agency Agreement to the Consolidated for gas.

By Mr. BURR:

Q. As a matter of fact there would have been a saving of about 2.4 cents per thousand feet in all.

A. Yes, sir, in the companies with which the Consolidated has an Agency Agreement. In fact there would have been a slightly higher amount than that as subsequently discovered, because I found in the exhibit of the Mutual, which has not been put in evidence in this

case, that they were paying and did pay in the year given in Exhibit 31 of the testimony before the State Gas Commission, they were paying 4.495 cents per gallon for oil during the same period, ending October 31st, 1905, in which the Consolidated was paying
3000 about 4.08 cents, and the New Amsterdam 4 cents.

By Mr. Mathewson:

Q. Then the Mutual was paying more than the Consolidated or other companies?

A. Yes, sir.

Q. Because they make their contracts independently instead of through the Consolidated, as the testimony shows, I suppose?

A. Yes.

By Mr. Burr:

Q. This 2.4 multiplied by the number of feet of gas obtained from these companies, 2,929,210,000 would mean a net saving in the cost of manufacture to those companies, the New Amsterdam, Mutual, Standard and Central Union of how much?

A. $70,301.04.

Q. And that benefit under the Agency Agreement would go to whom?

A. To the Consolidated Gas Company.

Q. What would the total saving be as obtained by adding this last amount to the $838,140.26 just mentioned?

A. That is the amount mentioned this morning as the saving in the other phases of the case, making $908,441.30. This is 6.69 cents per thousand feet on all the gas made or bought under the agency agreement, and would reduce the cost from 32.77 cents per thousand feet of gas in the holder to 26.08 cents per thousand feet of gas sold, which would reduce the cost from 33.52 cents to 26.68 cents.

Q. That would be six per cent. on how much?

A. On over fifteen million dollars.

Q. On the basis of the consumption of 1905?

A. On the basis of the consumption of 1905.

Q. Now it is in evidence here that the price of coke was
3001 slightly raised in 1905. What was the result of that?

A. That, according to the testimony in this case (pages 644-5) testimony by Mr. Carter, would naturally result in a little more from residuals, therefore to that extent a reduction in the cost of the gas; but it would only be solely for that in the period covered by Exhibit 94, because it only went into effect October 13, 1905.

Q. Now, regarding the inferiority in construction and the location of the 14th and 42d Street coal gas stations, to which you have referred, have you in mind any testimony bearing on that subject?

A. Yes.

Q. Will you be good enough to refer to it.

A. The engineer of the Consolidated, Mr. George E. Wood, in direct charge of all the stations, as stated on page 93 of the printed testimony before the State Gas Commission.

Mr. **Mathewson**: Wouldn't it accomplish all purposes to offer it, instead of having it characterized?

Mr. **Burr**: Just read it, so there will not be any mistake about it.

The **Witness**: I read from page 93, on the examination of Mr. George E. Wood:

"Q. What is your occupation? A. Engineer of manufactories of the Consolidated Gas Companies.

Q. You have direct charge of the various stations at which gas is produced in the City of New York of the Consolidated Gas Company? A. I have.

Q. They are all under your immediate direction and supervision? A. Yes, sir.

Q. Will you state the stations and their location? A. 14th Street Station, 14th Street and East River; 21st Street Station, at 21st Street and East River; 42d Street Station, at 42d Street and North River; 44th Street, at 44th Street and North River; 99th Street, at 99th Street and the river." 3002

The **Master**: All that is in evidence somewhere or other. What is the use of taking time to do this, stating where the different stations are?

The **Witness**: Yes. I did not need to read those except to show he was in charge of those? Then on page 127, 128 and 129 of the printed testimony before the State Gas Commission, he was being asked about the cheaper gas of the Central Union Gas Company as compared with the Consolidated.

Q. That is the Central Union Company's plants as compared with the Consolidated Company's plants?

A. Yes, sir; and the question was (page 127):

"Q. Have you investigated in any way to see how they can produce gas at that price while it costs your Company apparently so much more? A. Yes, there are reasons for it.

Q. Did you make any investigation at that time? A. No, I did not investigate, I thought I knew the conditions that existed.

Q. What are those conditions? A. Well, they were getting a better price for their coke than we were able to get downtown, I think; the type of their apparatus—I think.

Q. You say I think, do you know? A. No.

Q. Do you know what your Company was getting for coke? A. No, I do not, only I know——

Q. Then, as to the next reason? A. The type of their apparatus is different and is more up-to-date than what we have at our coal gas stations down here on Manhattan Island; they have inclined retorts and we have the old fashioned horizontal that are small, they require a great deal of labor, and the use of a great deal more coke under the benches to keep them going than the type of furnace that they have in The Bronx. 3003

Q. Then you think there is a very material saving in the case of the retorts, between the horizontal and the inclined furnace or retort? A. I think there is some difference, just how much I am not prepared to say.

Q. In the new works at Astoria that your Company are having installed there, they are to use the inclined retorts? A. They have inclined and horizontal over there, I believe."

Mr. MATHEWSON: It already appears we have both kinds and we don't know which are the best.

The WITNESS: Then a little later he states:

"There was one other thing, they were able to handle their coal more cheaply there; at the 14th Street station it cost us more money to get it into the retort house than it did cost them; there were little odds and ends that made up the difference."

Q. I understood Mr. Mathewson to testify a moment ago that they did not know which to use. Is that right, Mr. Mathewson, what you just got on the record?

Mr. MATHEWSON: I say it is the evidence that we are putting in both kinds at Astoria, and we don't know which will prove the most satisfactory; so it is testified by the engineers.

Mr. KIRBY: Not the same kind of retort that you have in your 14th Street plant?

Mr. MATHEWSON: That is another proposition.

3004 The WITNESS: This witness called them "the old fashioned horizontal that are small."

Mr. MATHEWSON: I understand it is simply stating as between horizontal and inclined. He was asked then whether they had horizontal or inclined retorts at Astoria. He said he thought they had both. He was not asked whether they had old fashioned ones at Astoria. Of course not.

Mr. BURR: I think that is all with Mr. Wood's testimony for the present.

Q. Taking up the station distribution and general cost as the same appeared in Exhibit 94, what was the total operating cost given in Exhibit 94 and how much did you deduct on the ground of fixed charges and interest on consumers' deposits?

A. The Consolidated Company in Exhibit 94, as was stated this morning, presents what it calls "total operating cost" as 74.81 cents, but from this I have already deducted fixed charges of 7.32 cents and interest on consumers' deposits of .39 cents, or a total of 7.71 cents as being in the nature of capital charges and not of operating expenses.

Q. How much did this leave. How was it divided between station cost on one hand and distribution and general expenses on the other?

A. Deduction of this 7.71 from 74.81 in Exhibit 94 leaves 67.10 cents. In this amount 33.52 cents, as already stated, is given by the company as production or station cost, and the remainder is 33.58 cents, which they divide into distribution and general expenses.

Q. Have you anything to say with regard to the items which make up this sum?

A. Yes.

Q. Please state.

A. Well, there should be deducted, miscellaneous income, which President Humphreys summarized as follows (page 1944)——

3005 By Mr. **Mathewson**:

Q. Do you understand that Exhibit 94 is a statement of expenditures and not of receipts?

A. Yes. But just as we deduct the receipts from the residuals in getting the cost of gas in the holder, I think it is appropriate to deduct—although I am aware that they do not do it in the Massachusetts returns—but I think it appropriate to deduct other receipts not connected with the sale of gas from expenses of distribution, following the same analogy in residuals as in the case of gas in the holder.

Q. What have you to say as to item "miscellaneous income"?

A. I have a table here giving those items. It will be table No. 11. I have it entitled, "Miscellaneous Income," and it is as follows:

Miscellaneous Income.

Stove rentals	$122,322.60
Discounts	9,497.57
Real Estate rentals	37,408.88
Sundries	3,481.48
Dividends of Natl. Coal & Coke Co.	5,000.00
Total	$177,710.53

Q. That you claim should be deducted?

A. Yes.

Q. What is that equivalent to?

A. That is equivalent to 1.34 cents per thousand feet of gas sold.

Q. Why should that be deducted for the cost of gas?

A. Well, for the same reason as we deduct the receipts from residuals from the cost of coal or oil in finding the net manufacturing or station cost.

Q. If these miscellaneous receipts are not deducted from the operating cost what would result?

3006 A. Then, of course, they must be added to the receipts from the sale of gas. The results so far as profits are concerned, are precisely the same in either case, but it is much simpler to start with placing in receipts only the money received from the sale of gas and to deduct all other receipts, whether from residuals, or stoves or real estate rentals, and so forth, from the operating expenses.

Q. Is there still another deduction to be made, in your opinion, in the matter of street lamp expenses?

A. Yes, I think they should be deducted. They are given in Exhibit 94 as $289,259.09 or 2.18 cents per thousand feet of gas sold. Nominally this is all recovered from the City in special charges for care of street lamps, but Mr. Addicks claims that 3.75 feet of gas is used per hour in the Welsbachs instead of 3 feet, as nominally charged, so that after allowing 90 cents per thousand feet for gas so used there is left over $260,614.26 for maintenances and other lamp expenses, as compared with an actual expense for the work of $289,259.59. That is, Mr. Addicks (page 1908 of the testimony in this case) claimed a net loss of $28,645.33. This, however, which seems to be the maximum claim of the company, is only .22 of a cent instead of the gross expense of 2.18 cents given in Exhibit 94.

Q. How much does this amount to per thousand feet of gas?

A. That is .22 of a cent. So I do not deduct the whole 2.18, but I take the difference between that and .22. In other words, the company gets back 1.96 cents for lamp expenses, as well as 1.34 cents on account of miscellaneous income. This makes a total recovered by the company of 3.3 cents from the distribution and general expenses.

Q. That is to be deducted from the distribution and general expenses?

A. Which they give—they give the gross distribution and general
expenses as 33.58 cents, and this miscellaneous income and
3007 net receipts on, or, recovery of expense on lamps which they
admit in the testimony, reduces the distribution and general
expenses to 30.28 cents.

Q. How much of this latter amount is represented by taxes, according to the exhibit?

A. In this Exhibit 94 it is given as 7.27 cents, and I notice that Mr. Addicks (page 1757) deducts .48 of a cent for taxes paid on account of other companies, and Professor Marks (page 2302) deducts 1.66. He excludes four items. At least three of these it seems to me should be deducted. The fourth I have not had time to investigate, so I only deduct the three. I have a table for that, which is No. 12, which is headed, "Deductions from Tax Returns," which is as follows:

Deductions from Tax Returns.

Taxes on income from other companies' securities.....	$5,257.48
Taxes on dividends in excess of 4 per cent. on $38,643,590.14, Stock, invested in other companies........	57,965.39
Interest on unpaid taxes..........................	94,506.29
Total	$157,729.16

Q. How much does this amount to per thousand feet of gas sold?

A. 1.19 cents. Whether any of the other taxes should be omitted, I was not in a position to determine, but the investigation by the accountants would give clearer light on that and many of these other items. I am taking the face of the returns here.

Q. You understand some of the taxes are in litigation?

A. Yes.

Q. Now, deducting 1.19 from the previous figure of 30.28 leaves
how much for distribution and general expenses, according
3008 to the claims of the company?

A. 29.09.

Q. For what?

A. That would be the cost of distribution and general expenses, with the above corrections.

Q. According to the claims of the company?

A. Yes, starting with the claims of the company.

By Mr. Mathewson:

Q. Starting with the exhibit in evidence?

A. Starting with the exhibit in evidence and deducting the receipts from miscellaneous income and the——

By Mr. **Burr**:

Q. Payments by the city for——

A. And the corrections on taxes, and the street lamp expenses—the receipts for maintenance of street lamps.

Q. And the reduction of taxes not directly charged to gas?

A. Yes.

Q. Now, may this 29.11 be divided into four items of taxes, repairs, contingent expenses including renewals, and other distribution and general expenses, and if so, give the percentage of each?

A. Well, I have divided into four items, taxes, 6.08; repairs, 3.56; contingent and renewal expenses, 5.31——

By Mr. **Mathewson**:

Q. What do you mean by contingent; do you mean to say any part of that is contingent?

A. I call it that item because that was the name used in Exhibit 94.

Q. But that included an actual contingent as well as expenditure?

A. Yes.

Q. Well, which is this?

A. This is their expenses for renewals and contingent expense not included in repairs, 5.31. And other expenses, such as management,
salaries, collection of bills and all other distribution and gen-
3009 eral expenses aside from those already mentioned, 7 cents, an
item which the company gives as 9.45 cents. I will give you
a table on that, as follows:

TABLE 13.

EXHIBIT 94 AND CORRECTION OF SAME.

	Operating cost according to Exhibit 94.	Operating cost according to Bemis' preliminary estimate per 1000 ft. sold.
Station	33.52c.	26.68c.
Repairs on Distribution System	3.56	3.56
Taxes	7.27	6.08
Contingent and Renewals	10.00	5.31
Other Expenses, aside from excluded items	9.45	7.00
	63.80c.	48.63c.
On basis of Station Cost Claimed by Company	......	55.47c.

Excluded items:

Lamps	1.96c.	
Miscellaneous Income	1.34	
Fixed Charges	7.32	
Interest	0.39	— 11.01c.
		74.81c.

On the basis of other expenses as given by the company, to wit, 9.45 cents instead of 7 cents equals 57.92 cents.

By Mr. Burr:

Q. You refer in giving these items to the table headed "Exhibit 94 and Correction of Same."

3010 A. Yes, the table I have just handed in, No. 13. The first column of Table 13 is merely a rearrangement of what the Company itself gives in Exhibit 94, giving the same total, 74.81, and the same items, only they are in many cases put together. Now Mr. Mathewson has asked me with regard to the 9.45 cents which appears in the fifth line. Now that as stated there is "Other Expenses, aside from Excluded Items," such excluded items being those that follow:

"Lamp, Miscellaneous Income, Fixed Charges, and Interest, 11.01 cents," which I have already testified about. The contingent 10 cent appears in that form in Exhibit 94, also the taxes, also the repairs and the station cost. Now in the last column is my preliminary estimate—I call it preliminary because it awaits on the final investigation by the accountants for any possible changes—but my preliminary estimate, the first station cost is given this morning as 26.68, and in the early part of the afternoon; Repairs on Distribution System 3.56, taxes reduced from 7.27 to 6.08 as I testified a few minutes ago. Then contingent, by which I include also renewals not 10 cents as the Company gives it, but 5.31 cents; and "Other Expenses, aside from Excluded Items," which amount in their exhibit to 9.45 cents, although they had not given that particular figure, I reduce to 7 cents, making a total of 48.63 cents as compared with 63.80 cents as the total cost at the burner per thousand feet of gas made aside from return on capital.

Q. What is this 55.47?

A. Now on the next line I give what those costs would be at the burner on the basis of the station costs claimed by the Company, which was 33.52 cents, while I had taken 26.68 on the basis of the testimony I gave this morning but on the basis of the station cost claimed by the Company it would be 55.47 cents. Now I

3011 have added here another line at the bottom of this table: "On the basis of other expenses as given by the Company, to wit., 9.45 cents instead of 7 cents equals 57.92 cents." That represents the same cost as the Company claims with three exceptions, first a change in taxes to exclude taxes on property not connected apparently with the gas business, and reducing the contingent and renewal from 10 cents to 5.31, and excluding those items, four in number, Street Lamps, Miscellaneous Income, Fixed Charges and Interest.

Q. That is, making the reductions which appear in the column headed "Operating Costs according to Bemis' preliminary estimate per thousand cubic feet sold," and taking the basis of the Company's own statement as to station costs, it amounts to 55.47 cents?

A. Yes.

Q. And adding to that their own figure, that is, you take their own figure as to station costs and then you add their own figure as to other expenses?

A. Yes.

Q. As given by the Company, 9.45 cents, making a total of 57.92 cents?

A. Yes.

Q. As the cost in the burner?

Mr. MATHEWSON: You do not add the 9.45 cents, but add the difference between that and the 7 cents, which was employed by Professor Bemis.

Mr. BURR: Yes, that is what I mean.

The WITNESS: Yes, that is right.

Q. That gives the total in your estimation and judgment as 57.92 cents as the cost in the burner?

A. Yes.

Q. That is using their figures?

A. That is using their figures. I do not change my opinion.

Q. Your conclusion is that it is 48.63?

A. That is right.

3012 By Mr. MATHEWSON:

Q. Do you mean that that is your conclusion of what it does cost or what it——

A. Does cost or should cost; what it should cost either at present or with an up-to-date plant.

By Mr. BURR:

Q. What have you to say, if anything, as to the items called Other Expenses?

A. That I take at 7 cents, the reason being that the accountants found, as given in this case in a letter which has already been put in evidence that in Chicago it was only 17.2344 cents and that included repairs and renewals of 6.0043 cents.

Mr. MATHEWSON: I wish you would repeat that again.

The WITNESS: The Chicago accountants found the total distribution and general expenses to be, in the People's Company 17.2344 cents; they also found that that included repairs and renewals of 6.0043 cents, and in the hearing when I was testifying, the attorney of the company stated that the taxes were 5.5 cents per thousand feet. The taxes amounted to $604,000 and the sales were approximately twelve billion feet, which as we worked it out before the City counsel together, was 5.5 cents. Now, this item of Other Expenses does not include either taxes or repairs, which are elsewhere in this table. Deducting the taxes and repairs in the Chicago Report, namely, this 5.5 cents and 6.0043 cents or a total of 11.5043 leaves for the other expenses of distribution and general 5.7301 cents. Now, the Chicago Company sells only one-third as much gas per mile of main and has one-third as many consumers per mile as does the Consolidated Gas Company.

3013 By Mr. BURR:

Q. Do you know, by the way, how many miles of main they have in Chicago? Is it not two thousand or thereabouts?

A. I know it, yes. In the annual report of the People's Gas Light & Coke Company for the year ending December 31st, 1904, which I hold in my hand, it is stated on page 6: Street Mains, 1,939 miles; Meters, 359,327; Gas Stoves, 145,222——

Mr. Mathewson: You were not asked about all that.

Q. That 5.7301 cents includes something that the People's Gas Company charge to the expense of street lamps besides, doesn't it?

A. It did. I was given the form of distribution items which were included in the report, and they included the following in the People's Company: Meter repairs, main repairs, service repairs, gas stove repairs, general expense, including amounts written off, etc., office expense, New York office expense, legal expense, governor house expense, street expense, applicance expense, wages and salaries, meter setting, statement taking, turn on and cut-off, complaints, general inspection, burner inspection, fittings inspection, meter deposit, interest, rent, competition, lamp account, uniform account, advertising account, employees' aid, pensions, thawing, gas stove complaints, gas lost, taxes, insurance, store expense.

Q. Still referring to this item of other expenses, what in your opinion is an ample allowance for those in New York?

A. 7 cents.

Q. That is, not having before you the information that the accountants may have obtained?

A. Yes, subject to change if they find more, but based on the Chicago experience, it seems ample.

Q. What have you to say as to the contingent expense of
3014 ten cents claimed by the company?

A. That expense or renewal expense and contingent, as I finally made it read, I have figured upon as 5.31 cents. The way I reached that was this: The total repairs of the manufacturing portion of the system, according to Exhibit 94, were 2.02 cents, and the repairs upon the distributing system 3.56 cents, or a total of 5.58 cents. The difference between that and the average repairs and renewals for the twenty years preceding 1905, which were 10.89 cents as stated by the company (State Exhibit L, page 417), amount to 5.31 cents, and that is used instead of ten cents. In other words, I simply give enough to make up the total in repairs and renewals from the average of the last twenty years, or the last twenty years preceding 1905.

Q. You have prepared a table entitled Exhibit 94 and corrections of the same, have you?

A. That is the table that was really introduced a few moments ago.

Mr. Mathewson: Which was read in as part of your evidence?

The Witness: Yes.

Q. This table, Exhibit 94, and corrections of the same, what does that show?

A. That shows the cost to be 48.63 cents, in my opinion, with a proper first-class plant.

Q. As compared with?

A. 63.8 cents given by the company as their expenses with their plants and with their contracts for oil, and so forth. It also shows a cost——

Q. Do you mean the present plant, up-to-date plant, or a new plant?

A. 48.63 cents shows a cost with the present plant, or a plant doing as well as the New Amsterdam, Standard, or the Central Union are doing, and with a reasonable price for oil. Whether that 3015 requires a better plant than they have now, I will not undertake to say.

Q. If the company is not actually making and distributing gas as cheaply as your estimate of 48.63 cents, what reasons do you assign therefor?

Mr. **Mathewson**: Has he not gone over that. He has made certain deductions and stated upon what basis he makes them.

The **Witness**: I think I have covered that now.

Q. You have also stated what the result would be assuming the station costs are what the company returned them at?

A. Yes.

Q. We will take up the subject of return on capital. From your study and investigation of gas works and gas accounts and of the testimony and exhibits in this case and all the other matters that you have stated and considered in connection with the reports of 1885 and 1886, the Stevens Commission and the Gas Commission testimony, what is the best evidence of a proper return upon capital?

A. It is what one gets from the purchase of gas securities in the market. For example, if one pays $120 for a share of stock which pays a dividend of 6 per cent., the purchaser only secures 5 per cent. on his investment of $120, and that would show if he were willing to buy a 6 per cent. stock at $120, that he considered 5 per cent. a reasonable return on a gas investment.

Q. Have you made a study of the securities of other companies?

A. Yes.

Q. In other States?

A. Yes.

Q. You might specify a little in detail.

A. I have made a careful study of all the securities of all the large gas companies east of the Mississippi and north of the Ohio River that are quoted in the recognized financial authority, the *Commercial and Financial Chronicle* of this city.

3016 Mr. **Mathewson**: You mean a study of what their securities sell for?

The **Witness**: Yes.

Q. What do you find from this study as to bonds?

A. A study of these quotations for the year——

Mr. **Mathewson**: Is this also admissible under this ruling.

The **Master**: I do not think so, but——

Mr. **Burr**: We will produce these——

Mr. **Mathewson**: I do not object on the ground you have not the original papers here, but on the ground it is incompetent and immaterial.

The MASTER: I doubt very much about general testimony as to market prices of gas securities all over the country, without any knowledge whatever of how the conditions attending those companies compare with those in this case, and to attempt to compare the conditions existing in every case with the conditions existing here would raise a number of collateral issues which manifestly even the free and easy methods of an equity suit would not permit, and I do not see that it is very material, but if it is not long, I will take it for what it is worth, but it is only fair to say that I do not think it is of very great importance.

Mr. BURR: It will only take five minutes.

Mr. MATHEWSON: Of course, we will have an opportunity to rebut it?

The MASTER: It opens the door for a great deal of very remote testimony, if the other side think it of sufficient importance to follow it up.

Mr. BURR: It is in the line of replying as best we may to the statements made by their bankers and financiers.

3017 The MASTER: Of course, to a certain extent they have invited that testimony by putting in general testimony of bankers, but that is a little different than putting in definite prices of securities. However I will al-ow it.

Mr. MATHEWSON: Exception.

A. A study of these quotations for the year 1905, was given in the review of that year published at the beginning of the year 1906 by the *Commercial and Financial Chronicle* and a study of the quotations of the year 1906 to date as given in the Bank and Quotation Supplement of the *Chronicle* of September 8th, 1906, shows that of the thirty-four issues of gas bonds of large companies in twenty-four different cities every 5 per cent. bond was at par or above throughout 1905 with the exception of the Buffalo Gas Company, and every four per cent. and four and one-half per cent. bond was above 90 throughout the year.

Q. What do you find as to stocks?

A. A similar study of the price of gas stocks has been made; not many are quoted, but the following are the dividends during the last twelve months and the prices actually brought for their stocks during the current year and given in the *Financial and Commercial Chronicle*, Bank and Quotation Supplement, for September, 1906.

3018

(TABLE 14.)

Gas Stocks and Dividends.

January 1–September 1, 1906.

Name.	Annual dividends. Per cent.	Price of stock.	Net return on investment. Per cent.
Cambridge, Mass	10	275	3.64
Charlestown, Mass	10	252	4
Lowell, Mass	10	248	4
Lynn, Mass	10	325	3.08
Mass. Gas Companies, Com	...	57¾	
" " " Pref	4	88½	4.52
Montreal Light, Heat & Power Co	4	96	4.17
United Gas Improvement Co., Phila	8	172¾	4.65
Consolidated Gas, Baltimore, Common	...	37½	
Washington, D. C	10	300	3⅓
People's G. L. & C. Co., Chi	6	99	5.27
		to 114	to 6
Laclede G. L. Co., St. Louis, Common	5	95	5.26
Laclede G. L. Co., St. Louis, Preferred	5	95	5.26

Q. From this it would appear that the stocks are all selling on a six per cent. basis, would it not?

A. They were selling on a better basis than that. They were nearly all of them selling on a four to five per cent. basis.

Q. What do you find, Professor, in this regard from an examination of State's Exhibit 82, page 351, and State Exhibit 83, page 352?

A. The first exhibit mentioned, State's Exhibit 82, page 351, giving market quotations for the Consolidated Gas Company's 3019 stock since 1884 and Exhibit 83, page 352, giving dividends for the Consolidated Gas Company since 1884, show that since 1885 up to January 1906, there have been only portions of two years, 1894 and 1895, when one could secure six per cent. by an investment in Consolidated Gas Company's stock, the premium being so high.

Q. What do you deduce from these facts?

A. That it is a conservative statement that one can not secure more than a five per cent. return on an investment in gas bonds in any of our large American cities or more than six per cent. on an investment in their stock.

Q. Does this apply to companies that are newly organized?

A. No. It is quite possible that during the early history of these companies, from forty to eighty years ago, a larger return was necessary in the infancy of the business, in order to enable the securities to be floated at par, and that may be true in smaller cities to-day. I do not for one moment believe, however, that a Company possessed of the only rights that have been granted to sell gas in New York

City, as is true of the Consolidated Company and of the companies with which it has agreements, and selling more per capita and per mile of mains than any other city in the world, would have the slightest difficulty in floating at par all the five per cent. bonds and all the stock bearing six per cent. dividends that might be required for the actual cost of construction. Probably one-half of the money could be raised on a four and one-half per cent. bond and the other on a five and one-half per cent. stock, making an average return on the cost of construction of five per cent. Certainly a six per cent. return is very liberal.

Q. Would that be sufficient in your opinion to cover unforeseen contingencies?

A. Yes, it will cover insurance against unforeseen contin-
3020 gencies, as has often been referred to, like the gas explosion
in Boston. I might refer to that a moment if you like.

The Master: Well, Mr. Burr, I do not want to cut you off, but is not this a little speculative? The Professor has not been shown to have any experience in the flotation of securities of this kind. As to what could or could not be done, that is a matter which could be put in your brief, as well as putting it in as testimony here.

Mr. Burr: Well, that is all we were going to put in on that subject.

Q. Now, the Boston explosion which has been referred to here by President Addicks, I think——

A. Yes.

Q. Have you any information in regard to that, or its causes, or any findings with regard to that subject?

A. I know of no other gas explosion as costly to a Company as that, and its occurrence anywhere else seems exceedingly improbable. As to that Boston gas explosion I will quote from the report to the Massachusetts Legislature relative to this explosion, the report being dated June 4th, 1897, and being made by the Massachusetts Gas & Electric Light Commission, in response to a request by the State Legislature for a report. This report appeared in the Appendix Page 172, of the Annual Report of the Massachusetts Gas & Electric Light Commission for the year ending June 30th, 1897, the explosion having occurred a little before in the same year, and I will read merely a short statement about the causes.

"In the light of the event itself, this explosion might have been averted if any one of the following things had been done:—" Now
I omit three statements, and come to the fourth.
3021 "Fourth. If reasonable skill and activity had been applied
in the management of the jobbing department of the gas company, so that one of its jobbers had been sent with reasonable promptness on the complaint from the Masonic Temple or upon the later complaint received from the police officer.

"The work of the subway throughout its length was one of unusual hazard and extraordinary difficulties. Life and property were both imperiled, and the danger to the latter was perhaps the more obvious.

"It is doubtful if the difficulties encountered at the intersection of these streets, in the number and character of the underground structures met, in the enormous amount of street car and other traffic to be maintained without interruption, in the nearness of the new structures to the surface of the street were ever paralleled in any public work."

Q. Now what do you conclude from this?

A. I conclude that the Company was partly to blame, and that it is not reasonable to ask the gas consumers to insure the Company against its own mistakes. But I should think that 6 per cent. being much more than an ample return on an investment without risk, for such investments can be floated at 4 per cent, and even less, that there is covered in the 6 per cent. some risk.

Q. Your conclusion is that 6 per cent. is ample?

A. Yes.

Q. Have you any further confirmation of this statement as the result of the facts gleaned by you with regard to other companies?

A. Yes.

Q. Please state what companies you refer to?

A. Reference should be made to the action of the Massachusetts Gas & Electric Light Commission during the year ending
3022 June 30th, 1905, as given in their last printed report, pages 18 to 36. This relates to the action taken by this Massachusetts Commission in fixing the interest on new bonds and the premium on new issues of stock. Very significant in this connection are the orders issued in the year ending June 30th, 1906, by the Massachusetts Gas & Electric Light Commission for the issue of new securities by several gas companies in Massachusetts. It may be observed that the Massachusetts Commission has the right to fix the interest on all new bond issues and the price at which stock issues may be taken by the stockholders.

The Clinton Gas Light Company secured the right to issue $110,000 worth of bonds. The Commission stated, pages 21 and 22 of the report, that the bonds can be placed at par and yet bear interest at 4½ per cent., and that interest was fixed by the Commission.

The Cambridge Company was permitted to issue 1,200 shares of stock, but the market value was fixed at 200, the stock paying 10 per cent. dividends; which means that the Gas Commission consider 5 per cent. sufficient return on further investments, while any one buying in the open market, already observed——

Mr. Mathewson: I move to strike out "Which shows that the Gas Commission considers etc."

The Master: Strike it out.

Q. You need not characterize it.

A. While any one buying in the open market, as already observed, would get less than 4 per cent., because the stock is selling at 275.

The Lynn Gas & Electric Light Company likewise, was only allowed by the Gas Commission to issue its $100 shares at $200. Since

its shares were paying 10 per cent. this gave only a five per
3023 cent. return on the new investment. It may be remarked
that the State Commission only fixes the price at which new stock can be taken by the old stockholders without public bidding. Any stock which the stockholders do not care to take, at those prices fixed by the Commission, is sold at auction after due advertisement. Experience has shown that the stockholders usually take all of the stock at the price fixed by the Commission.

Brockton was allowed to issue 1,300 shares at par but that stock was only paying 5 per cent.

The Newburyport Gas & Electric Company was allowed to issue 600 shares at $100 a share. The stock was paying 5¾ per cent.

The Fitchburg Gas & Electric Light Company was allowed to issue 2,200 shares capital stock at the par value of $50 each at 80, that is, at 160. Since the stock was paying only 8 per cent. this meant again a five per cent. return.

The Natick Gaslight Company was allowed to issue 250 shares at par. The company was paying 4 per cent. dividends.

The Malden and Melrose Gaslight Company was allowed to issue 2,025 shares of stock, at $120 each. Since this stock was paying 9 per cent., it was equivalent to 7.5 per cent. return on the investment. This was the highest return authorized.

The Worcester County Gas Company, which was paying no dividend, was allowed to issue $85,000 of new stock at par. It appears from all the above illustrations, that, with one unimportant exception, existing stockholders were forced to put up with a 5 per cent. investment or less on all new investments in the gas business.

Q. That is, 5 per cent. return on the new investment on the gas business in Massachusetts?

A. Yes.

Q. Do these companies sell as much gas as the Consolidated Gas Companies?

3024 A. Not one of them sell one-twentieth as much gas as the Consolidated Gas Company.

Q. And in your opinion, under these circumstances, 6 per cent. would be a liberal return to the Consolidated Gas Company?

A. Yes.

Q. Now, these investments that you speak of in Massachusetts and the issues of stock and bonds since 1894, could they be made for any thing more or other than actual construction?

A. No, neither in Massachusetts nor in Great Britain can securities be issued or prices charged on sales of gas to cover either an increase in the value of land owned by the company or the value of street paving put over the mains at the expense of the tax-paying consumer of gas.

Q. Have you read the testimony of Professor Humphreys in this regard to which you refer?

A. Yes.

Q. Will you kindly call the Master's attention to it? I think it is very important.

A. In the Holyoke Gas case, the Holyoke Water Power Company, Petitioner, against the City of Holyoke, Volume 2, pages 277 and 278, occurs this statement:

"Q. You have not in this case taken, in the first place, the structural value of the gas plant and the electric light plant, and then added to it an additional value on account of what the plant could earn, but you have made your valuation in the first instance upon the earnings? A. I followed my usual practice by basing it on earnings, simply checking myself up, simply to show that my assistants reported to me a plant capable of maintaining that business.

3025 "Q. Why do you take 5 per cent. as the sum at which you capitalize the net earnings of the company? A. In my judgment that was a fair return on that kind of an investment.

"Q. By that do you mean annual return to the persons who put their money into it? A. Yes.

"Q. And if the investment were represented by stock, you would mean that dividends should be paid at the rate of 6 per cent? A. Yes, sir.

[On the margin:] 6% amended to read 5%. See Supplemental Opinion March 11, 1908, Paragraph IV.

"Q. And whether or not in making this estimate of value you assumed that there would be the same freedom from competition that now obtains? A. I assumed the same conditions.

"Q. With respect to competition? A. Yes.

"Q. That is, you assumed the same conditions that now exist? A. Freedom from competition.

"Q. And I understand you to say that you valued this plant on the same basis that you valued the plants which you were employed to appraise in New York and New Jersey and other States? A. The same conditions generally."

After some discussion between the attorneys the witness finally stated this, at the bottom of page 278:

"I did not go into that very specifically, but I reinforced my opinion as to the values by my general impression that gas properties and lighting properties in Massachusetts are perhaps a little better protected than in other parts of the country. I did not make any special allowance, but I thought that reinforced my judgment as to the values.

"Q. Was your attention called to any particular feature of the laws of this State affecting gas and electric light companies? A. No.

Redirect examination by Mr. Brooks:

3026 "Q. Whether or not you took into consideration at all the future earning capacity? A. No.'"

Q. What was the nature of that proceeding in which Professor Humphreys, who testified in this proceeding, testified?

A. It was a case in which the City of Holyoke had voted to purchase the gas and electric light plant, and under the State law of Massachusetts the Company has the right to require the City to purchase the plant then in operation, and the law provides that a

State Court shall appoint a Commission to receive evidence as to the value of such a plant.

Q. And was Professor Humphreys called as a witness to testify as to the value of that plant?

A. Professor Humphreys was called as a witness to testify as to the value of that plant.

Q. And in that proceeding he testified as you have read?

A. Yes.

Q. Do you wish to take up the question of the capitalization?

A. I am prepared to, and the cost of the property.

Mr. MATHEWSON: I should correct, if you will permit me, a misapprehension that got on the record this morning with reference to the Mutual Gas Light Company. It was formerly a coal gas company and not having represented that Company, I was under the impression that they manufactured some coal gas. I understand they do not, so that if I am correct, of course it would be impossible for Professor Bemis to make the comparisons suggested.

Mr. BURR: That was the reason that I refused to accept the offer you made me.

3027 The WITNESS: I did not have a chance to state this morning that I had looked for an evidence of coal gas but could not find it.

Q. Have you taken up the consideration of the cost of the property of the Consolidated Gas Company?

A. Yes.

Q. And have you examined the testimony given before the various Commissions?

A. Yes.

Q. As it appears in the reports of 1885 and 1886 for the purpose of getting all the information you possibly could on that subject?

A. Yes.

Q. You might tell us what you did do in that regard?

A. I read the two reports to the Senate——

Mr. MATHEWSON: My objection to this line of testimony, is made, Mr. Master, and does it meet with the same reception.

The MASTER: We will go on a little further with it and see. What did you say you had read beside the two reports?

The WITNESS: That is all I had said. There were two reports made in 1885 and 1886. I started with Mr. Yalden's report, with full knowledge of the fact that the report of two members of the Committee constituting a majority in 1886 stated at page 76 of the report, referring to the——

The MASTER: Never mind that, Professor. What I want to get at is the question as to the propriety of these articles.

The WITNESS: I wanted to give my reasons for accepting Mr. Yalden's statement.

Mr. BURR: We have Yalden's reports in evidence.

3028 The MASTER: Do I understand he is going to testify as to the value of these properties and his conclusions based upon something which appears in these reports of the Senate Committee?

Mr. Burr: You have three documents before you here. One is the report of the Committee of 1886, another is the appraisement made at that time by Thomas F. Rowland, introduced by the Committee; and the other is the report of the Committee of that year, 1886, the minority part which was offered by the City and the majority part was offered by the Company. Now we are taking these just like exhibits in the case from which he has arranged such items of cost which will lead up to the present situation here.

The Master: It seems to me that is a little remote. In regard to these other branches of the case, where he based his testimony largely on the evidence taken in this case and tabulations put in by the other side, I allowed you considerable latitude on the theory that as a statistician, it was competent to analyze and criticise and pick flaws in any figures that the other side advanced. But, as I understand this proposition his criticisms are not directed towards any of the evidence in this case, but he is basing some theory here on reports made by the Senate Committee or documents contained in those reports that we have nothing to do with here.

Mr. Burr: No, he is starting with a situation which is made evident as existing at the time when the consolidation occurred, as appears by these exhibits, and starting with that, he is taking that as a basis in connection with the statement now here before you as to what has been spent in that time for construction and what has been spent in that time for repairs and what the present valuation of that
3029 property is, and in order to be logical I have got to start at the
beginning. And I will read to you, he does not need to testify at all, I can read from the testimony there given, the testimony of Rowland and the testimony of Yalden, and starting with that testimony and in connection with these exhibits here, have him arrange his conclusions as the result of that situation.

The Master: Well, but does not even that go back pretty far?

Mr. Burr: It does, but in my judgment—I may be wrong and we entertain undoubtedly different views in regard to that—but I think the Court is entitled to take into consideration the cost of these plants and the costs as they appeared upon the books of the companies and given by Yalden in his testimony and the manner in which Rowland raised that cost, by his appraisal, as stated by Mr. Rowland himself, and I think you are entitled to have that statement from the past before you. It is not long and it is not going to occupy much time. The whole thing is here and it is a few extracts by question and answer as to what basis they took. Yalden took the valuation from the books and Rowland took another system of appraising, and the amount of his appraisal is in the exhibit before you, and that I think is material in view of what we claim is the real investment in these plants making gas upon which we contend they are only entitled to a return.

The Master: I do not understand that the other side has put in any proof as to the value of the plant based upon what it cost in 1884 or what they allowed for it in 1884.

Mr. Burr: No, they carefully avoided it. They are insisting that

we have nothing to do with it, but you are to find the value
3030 as it has appreciated in the year 1906. We say you must look
back and see what was the real investment in this business.

The Master: But if you are going to fix the price of gas based on what property they have employed in the gas business, is not the question as to what that value is to-day? What difference does it make what it was worth twenty years ago? It may have gone up or gone down.

Mr. Burr: I think it makes a good deal of difference in our view of this situation. We present the cost of this property at a certain year and we take their exhibits and show what they claim to have spent on it since both in repairs and new construction and renewals, and we say there is the original valuation as appears upon the books and here are vast sums of money they have spent and that represents what it has cost them up to the present time.

The Master: And a further question suggests itself to my mind, and that is that whatever valuations this witness testifies to according to your statement are book valuations made up by expert accountants. Now, I do not understand, do you, that in getting at the value of a company that book valuations are evidence of any great weight? A great many companies consistently carry their book values very much below or very much above what the actual values are or the actual cost for purposes of their own. Some companies carry them down as low as one-tenth of the cost and some companies, who may want to float a bond issue, carry them away above.

Mr. Burr: You will see that this inventory in 1886 was for the purpose of ascertaining whether there was a justification of a capitali-
zation of $37,000,000, so the inquiry went to the root of the
3031 thing, and the root of the thing was brought about through
Yalden, who went to the books of the various companies and
he states in this statement how he arrived at his figures.

The Master: But at the best, it is a second-hand reproduction of Mr. Yalden's testimony with no opportunity to cross-examine him, and *non constat*, we do not know but what if he were cross-examined his figures would be deprived of their value.

Mr. Burr: The same applies to the report of Michael C. Murphy. He is dead and Mr. Yalden is dead. We take the figures as they are attached to the Senate Document, Exhibit 42.

Mr. Mathewson: Is not this the situation, you first offered page 76 of the report of 1886, and we objected, but the Master admitted it, showing how the $20,946.60 were made up, which was said to be the value at which these items of assets were carried on the books of the constituent companies. That was all it purported to show. Then that having been admitted we offered the majority report and you offered the minority reports, and then later on offered all the schedules of Yalden together with his report. Now why does not that cover the whole ground? You offered the schedules as they are in evidence.

The Master: Well, I have been very liberal about allowing all these things that took place before the various bodies who investigated this matter, in view of the memorandum and opinion from

the court that time would be saved here by allowing both parties to
put in all sorts of tabulations which might otherwise require new
work, and on that theory I have allowed all these things to go
3032 in which might under the strict rules be objectionable; but
it seems to me that when I have gone that far it is about far
enough. There is no particular force in allowing a witness to go to work and testify basing his arguments on those matters which are some of them twenty years old at least. I have no desire to cut you off, but it does seem to me that it is getting a little beyond the proper scope of the inquiry. I am disposed to sustain this objection and give you an exception, and if you decide to press the matter of course the witness can answer and it can go in in the ordinary way and be on the record. But I think that I must exclude it.

Mr. **Burr**: I want to call your attention to th- fact that in the Stevens Committee Mr. Hughes read from this very book that I am referring to, the testimony of Mr. Gawtry. And in the Gas Commission I am informed they used Yalden's figures.

Mr. **Mathewson**: No, I do not think it was the testimony of Mr. Gawtry in that proceeding, but the testimony of Mr. Gawtry in a subsequent proceeding relating to taxation which Mr. Hughes read. I do not think he read his testimony given in the investigation of 1886.

Mr. **Burr**: Will you say that the proceedings of 1886 were not read into the record before the Stevens Committee?

Mr. **Mathewson**: That is my impression, that none of it was read in.

Mr. **Kirby**: It was read in.

Mr. **Mathewson**: Well, it must have been very little.

Mr. **Burr**: Well, this is very little, but it is of extreme importance.

The **Master**: I may be in error about all this and it may be in
direct conflict with something I have held heretofore about
3033 this line of testimony, but it seems to me the way you put
it that that testimony is not only clearly incompetent, but
irrelevant and immaterial.

Mr. **Burr**: The Master has ruled it out and I take an exception and I now proceed to ask him under the ruling of the proceeding.

Q. Have you studied or consulted Yalden's figures in arriving at the basis of the cost of the property to the Company in 1884?

A. Yes.

Q. Did Mr. Yalden appear as a witness in that proceeding?

A. Yes.

Q. Will you refer me to the place where he testified?

A. In the index there are many references to his testimony, and then he has a whole appendix prepared apparently at the request of the Commission, of tables.

Mr. **Mathewson**: That is all in evidence, including his report preceding the table.

Q. You are familiar with the cost of the property as it appears there upon page 76 of the Senate Committee's report?

A. Yes.

Mr. Mathewson: You mean you are familiar with the cost of the property or with the statement?

The Witness: With the statement.

Mr. Burr: With the statement of the cost appearing on page 76.

Q. And referring to the report of the Committee on page 76 as to the appraisal by Mr. Rowland and others of the $30,190,419.01, the report states, does it not, "There is no evidence that any
3034 of these items were appraised too high, except the evidence of the expert, Mr. Yalden, who finds that they were higher than they appeared to have been charged as costing in the Company's books."

A. Yes.

Q. Now, in the minority report, page 28, there is a statement there that the stockholders had only contributed $8,727,050, and that the total cost from all sources of property paid for by stockholders' original contributions, by surplus earnings, by stock treated as money and from the proceeds of bonds and other loans was only $20,942,632.85, although the property was capitalized at $37,190,419.01 in 1884?

A. Yes.

Q. What leads you to believe in the accuracy of Mr. Yalden's figures as given in his report is the fact that he testified as a witness?

A. He did.

Q. Will you refer to his testimony in that connection?

A. He testified frequently throughout the 624 pages.

Q. I refer particularly to page 345.

A. On page 345 he was asked if he had ascertained from the books the actual cost to the Consolidated Gas Company. He replied yes in every company.

Q. Is there any further confirmation of this in the testimony taken before that Commission?

A. A very powerful confirmation in the testimony of Mr. John P. Kennedy, President of the Mutual Gaslight Company, which was organized in 1866 and was included in Mr. Yalden's investigation.

Mr. Mathewson: That is not one of the consolidating companies at all.

The Witness: It was included in Mr. Yalden's investigation.

Mr. Mathewson: It might be possibly true that it might be arguable, although I do not think it is, that if officers of
3035 & 3036 one of the constituent companies may have said something, it might be raised inferentially against us, but how an officer of the Mutual Gas Light Company, which is not one of the constituent companies at all can be offered here or be in any way competent, I do not see.

Mr. Burr: Only for this reason, that it takes 339 Mr. Kennedy states "The fact is we do not criticize Mr. Yalden's work, but take it for granted that it is all right." There is the President of the Mutual Gas Light Company, emphasizing the fact.

The Master: I cannot see that is of any importance, with all due respect. I will exclude all that.

At 4 P. M. adjourned to October 17, 1906, at 11 A. M.

Last Exhibits:

Complainant's 256,
State's W,
City's 56.

3037 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Wednesday, *October* 17, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr and Mr. Kirby.

3038 Mr. Burr: I want to read into the testimony at this point extracts from the testimony before the Senate Committee of 1886, apropos of the appraisal which has been introduced in evidence here, made by Mr. Rowland at that time.

Mr. Mathewson: My objection lies to that, I understand. I do object.

The Master: I will overrule it.

Mr. Mathewson: Exception.

Mr. Burr: Mr. Kennedy, the President of the Mutual Gas Light Company, being examined in regard to the appraisal of Mr. Rowland, testified as follows:

Mr. Mathewson: I further object on the ground that the Mutual Gas Light Company is not a party to the consolidation, so that no argument can be based on that proposition.

Mr. Burr: The fact is that they attempted to be a party to the consolidation, but were prevented by a statute, and got around it in another way.

The Master: I am overruling that objection simply from the fact that the material that Mr. Burr wants to get in is from some of these printed records in other proceedings which have been admitted, and the fact that it is twenty years old——

Mr. Burr: This is all pertinent to the valuation of the plant. I will read the testimony:

"Q. And the basis of the valuation of the plant was what it would cost to duplicate it? A. Yes, sir.

"Q. When you spoke of what it would cost to duplicate, did you mean what it would cost for a plant equivalent to the plant to be appraised? A. No, sir; to duplicate everything as it was

3039 without any reference to anything else.

"Q. Without reference to whether it was really necessary to produce a given capacity or not? A. Yes, sir.

"Q. And without reference to whether the plant or any part of it had been superseded, or rendered more or less useless by reason of the change in the method of production? A. Yes, sir.

"Q. So that the properties that were laid aside as useless, or comparatively so, caused by the change of production in the same works from coal gas to water gas, were to be appraised or valued according to what it would cost to duplicate them as they stood. A. Just as they stood.

"Q. In your opinion, would that be a fair way to buy a gas plant for present actual business purposes? A. No, I don't think it would. If I was going to buy one, I should want to get a modern one, of course."

Mr. MATHEWSON: What page is that?

Mr. BURR: Page 411. Now I go to page 413.

"I could only say that the companies were all estimated upon the same basis of valuation.

"Q. That basis was what it would cost, estimating the cost of material on hand? A. Yes, sir.

(By the CHAIRMAN:)

"Q. That might be a very different thing, getting at its real value as the purchaser would look at it? A. Yes, sir.

"Q. All you were looking after was to get it relatively right? A. Yes, sir; compare my own with the others.

"Q. To see that they were on the same basis? A. Yes, sir.

3040 "Q. The ultimate object was to get it relatively right? A. Yes, sir; to get it relatively right.

"Q. The appraisement was very different from a purchaser? A. Yes, sir; if the company desired to sell out, there would be two parties to the affair.

"Q. One of which would look to see whether this particular piece of machinery—what it would cost? A. Yes, and in this case there was only one party.

"Q. And he was the seller? A. Yes, sir. There was no one there to bid them down."

EDWARD W. BEMIS resumed.

Direct examination by Mr. BURR (continued):

Q. Now you heard Mr. Carter in this proceeding criticise Mr. Yalden's statement in regard to the Manhattan Gas Light Company. What have you to say to that?

A. I would say that Mr. Carter called attention to the fact that Mr. Yalden had reported the cost of the Manhattan Gas Light plant on page 671 of the Senate Report of 1886 as only $64,247.49, that is the cost of all the manufacturing portion of the property of the company, which Mr. Carter held to be very much out of the way. This statement——

By Mr. Mathewson:

Q. Mr. Carter used the word "plant" in his testimony, did he not, simply the word "plant"?

A. Probably. This figure of $64,247.49 purported to be for plant and was so interpreted by Mr. Carter, the term "plant" being 3041 used to cover the manufacturing portion of the property. But this is all explained in the next three pages of the same report of 1886 by Mr. Yalden, where it is shown that in the real estate item of $3,351,730.74 was included $1,890,810.82 of apparatus, and $513,022.94 of buildings and improvements. Mr. Yalden's report, therefore, did not ignore the manufacturing plant of the Manhattan Company, as a first glance at his table on page 671 would imply. I might add, in respect to this company, that Mr. Yalden stated in his testimony, page 368, "The Manhattan Company has nothing to show on the books for an increase in book value from $4,873,000 to $9,611,000." And I may state that this new capital went into the consolidation.

Q. Did you read all the testimony before the committee in 1886?

A. Yes, 624 pages and the appendix.

Q. And did you find Mr. Yalden's report referred to often?

A. Yes, and he himself was on the witness stand several times.

Q. And was it criticised in any respect?

A. Not a criticism.

Q. Was it approved?

A. Yes, it was taken for granted, at least, as correct.

Q. Now, as to the report of the committee of 1885——

Mr. Mathewson: Just a minute. This witness has now stated that the report of Yalden was approved in every respect, and it was taken granted. That is a pretty broad conclusion. Just what the witness means, I don't know, but it seems to be improper, in any event. What the testimony shows, it shows as to what Mr. Yalden took.

The Master: That seems to be a reasonable proposition, does it not?

3042 Mr. Burr: He has read all the testimony, and states that Yalden's conclusions were not disputed. He states that as a fact, in that proceeding. Now, if Yalden's figures were disputed and found to be incorrect, there is the record, which is open to Mr. Mathewson, as it was to me. We state that, from the whole record, his figures were correct and were not disputed.

The Master: That may all be. There may have been many reasons for not disputing them that I know nothing about, and which Mr. Mathewson could not show at this time. I think if I let those old tabulations in, that is as far as I am justified in going. I do not think the witness' conclusions about them are relative and material, and I do not think that any independent testimony based upon those tabulations has anything to do with this case. As I said yesterday, it seems to me it is too remote.

Mr. Mathewson: I move to strike out the language to which I just called attention, where the witness states his conclusions as to the acceptance of that report.

The Master: Strike it out.

Mr. Burr: Exception. I want to read into the record an extract from the report of the committee of 1885 on this subject.

Mr. Mathewson: That is the previous committee?

Mr. Burr: Yes.

Mr. Mathewson: I suppose counsel knows, but perhaps the Master does not know, that a committee was appointed by the Senate in 1885 to investigate this consolidation, which was completed in November, 1884, and that it was to report to the Legislature of 3043 1885. It did hastily make an examination and made a report, which was considered so insufficient that a new committee was at once appointed and directed to report the next year and go over the ground thoroughly. That was the second committee which reported in 1886, Senate Document 47, and from whose report various items have been put in. Now, it does seem to me that to take the report of the committee of 1885, appointed by the Senate, which was turned down and a new committee appointed because the committee of 1885 had not had time, the Senate thought, fairly to consider the question, and put in suggestions from that report is rather idle. I do not know how I could meet the proposition if the report had been the other way.

Mr. Burr: The object is to show, since you have made your statement in that connection, that this committee of 1885 in their report found just as the witnesses from whose testimony I have read found, as stated in their testimony in regard to the valuation. And they say: "The president of one of the New York companies, R. N. C. Graham——"

Mr. Mathewson: I do not think it should go on the record until we know what it is. I do not think you should say you propose to offer it, and then read it.

Mr. Burr: Well, I will read it without having it taken down, so the Master can see what it is (reading).

The Master: I will admit it, as long as the one of 1886 is in, and will let it go in.

Mr. Mathewson: Exception.

Mr. Burr: I read from the report of the committee of this New York Senate, March 30th, 1885, as follows:

"The president of one of the New York companies, R. N. C. 3044 Graham (of the Equitable Company) testified that in his opinion $15,000,000 would be a fair estimated capitalization to produce an annual output of 5,000,000,000 feet for the equivalent of $3 capital to each 1,000 feet on such a large output. The fact, as exhibited by recognized publications, appears to be that the average capital per 1,000 feet of gas in Great Britain is about $3.23 and in the City of London about $3. * * * But by the imposition of this consolidation it would appear to be at the rate of $8.75 per one thousand feet. This unreasonable result could not have been reached without the introduction of illegitimate items, the character of which has already been indicated. An illustration of the method of capitalization is afforded by the allotment of $3,000,000 of consolidated stock for the shareholders of the Knickerbocker Company. In fact, the Knickerbocker Company for several years has had only a nominal independent existence. Its entire stock was acquired, according to the testimony, by the Municipal Company, which caused it to be held for the benefit of the Municipal Company. * * * It is known that money was spent by the Municipal Company in increasing the works of the Knickerbocker Company, and that by the terms of such expenditure the property thus added was to be deemed to be the property of the Municipal Company. Several hundreds of thousand dollars appear to have been thus spent. The plant and works of the Knickerbocker Company, however, seem to have been rated in examination, at least, at their full value, while the franchises, so called, of the Knickerbocker Company are separately stated about $528,000, when in fact it had none."

3045 Mr. Mathewson: How foolish all that proposition is appears at the start, that a comparison with the cost in London is made, where material and labor, and everything else were less expensive.

Q. Have you tabulated these results as you found them in these reports?

A. I have.

Mr. Mathewson: Which reports?

Mr. Burr: Showing in his judgment and opinion what was the cost of the gas property up to October 31st, 1905, taking as a basis the statements I have just read from Yalden's report from the testimony that has been introduced already and read into the record here.

Mr. Mathewson: I object to this witness, who never constructed a gas works in his life, and who never even operated a gas works, stating what, in his opinion, is the value of our property to-day.

The Master: Objection sustained.

Mr. Mathewson: If he means to ask the witness to tabulate figures which he has taken which are not an expression of opinion on his part as to value, that is another question.

Mr. Burr: I am asking him to tabulate the figures which have been given in this case and the figures that have been read into the evidence here from the reports of 1885 and 1886.

Mr. Mathewson: No figures have been read in from the report of 1885.

Mr. Burr: Well, from the testimony as it has been read into the record here.

The Master: I sustain the objection for the reasons stated yesterday. While I am disposed to allow great liberality in admitting these old tabulations for the purpose of reference, in view of

3046 the language of the Court's memorandum, I do not think it is right to allow the witness to put in independent testimony, not based on the complainant's case, but on criticisms and analyses of these old documents over twenty years old. It is going pretty far afield, in my judgment, so I will sustain the objection, as I did yesterday.

Mr. Burr: I except.

A. This table, which should be numbered consecutively Table 15, cost of the gas properties up to October 31st, 1905:

Cost in 1884, according to Yalden page 776 of report of '86	$20,942,632.85	
Net increase from 1884 to Oct. 31, 1905, according to Complainant's Exhibit 79, page 347*a*	9,693,555.90	
Material and supplies (Complainant's Exhibit 80, page 348)	616,470.08	
Total	$31,252,668.83	$31,252,668.83
Less value of the property taken by the City at the 18th St. and other property sold by the Co. as given in testimony of Prof. Marks, page 2364	....	1,985,874.37
Balance	....	$29,266,757.46
Total cost of property per 1,000 feet sold in 1905	$2.20	
Profits, 6 *a*/*c* of $2.20	13.2c.	

That table takes the complainant's own figures for the changes since 1884, and takes Mr. Yalden's computation of the cost then. I am aware that Professor Marks (page 2367) made a further reduction of $2,077,530.50 for other property not in use in the gas
3047 business at 18th Street, as inventoried by Mr. Mayer, and at
112th Street, but I have not had the time myself to look into the matter as to particulars, and so have not subtracted those two items. I do not express any opinion as to whether they should be or not, therefore.

Q. Now, in your testimony before the State Gas Commission last winter you allowed the Consolidated a million dollars of working capital, did you not?

A. Yes.

Q. In your opinion do they need such an amount, and, if so, how do they secure it?

Mr. Mathewson: Is Professor Bemis an expert on this subject, as to what is required for working capital in a gas business?

Mr. Burr: He is now testifying from the figures that have been introduced here, and from the figures and the exhibits introduced before the State Gas Commission, whether you show that you have any need of that amount of working capital. You remember that Mr. Marks made the point also——

Mr. Mathewson: He had had some little experience in the gas business, although extremely remote.

Mr. Burr: As I said before, that all goes to the weight to be given by the Master to the testimony.

Mr. Mathewson: This witness was never in the gas business, and is asked what is the proper working capital.

Mr. Burr: That all goes to the weight of his testimony. If his opinion is not worth anything, the Master will probably find it so. If it is worth anything, and he can testify to his statements from exhibits here and from your own sworn testimony, that is another matter.

3048 The Master: I will allow it.

Mr. Mathewson: Exception.

The Witness: May I be permitted to say that in connection with the management of the water works in Cleveland we have similar problems, as the distribution system is very much analogous, and the question of working capital and other matters—the character of street mains, the effects of electrolysis, general clerical expenses and many other things are similar problems—not the same precisely, of course, but it is very much analogous in many respects.

Q. Now answer the question.

A. They have in their treasury, I believe, from half a million to a million dollars for working capital. The average monthly expenses aside from construction are somewhat less than $700,000. That is obtained by dividing their annual expenses by twelve; and they may need that amount on hand, but most expenses are probably only paid after thirty days, except salaries and wages, and many of those are by the month, and it seems quite likely that the current receipts which are coming in all the time from the sale of gas will take care of these bills when they are due. Still, I give them the benefit of the allowance of a full million dollars.

Q. How much does that million dollars amount to per thousand feet of gas?

A. It amounts to only—that is, the million dollars is only 7½ cents per thousand feet of sales in 905; and six per cent. of that is less than one-half cent per thousand feet; eight per cent. of it is less than .6 of a cent. Now, I might state there that $906,000 of that million they have from consumers and pay them only six per cent. on it, and it would not be necessary to add but six per cent. I will have here computations later on the basis of both six and eight per cent.

3049 Q. Now will you just state again what the operating cost was according to Exhibit 94 as corrected by you, in the matter of taxes and contingencies and renewals, and what was your own estimate?

A. 57.92 cents was my correction of Exhibit 94.

Mr. Mathewson: That has all appeared and it is, in so many figures, in his statement.

Mr. Burr: I want it in connection with these figures.

The Witness: And my estimate independently was 48.63 cents.

Q. If you add to this operating cost the return on capital you just mentioned of 13.2 cents, what would be the result?

A. It would be 71.12 cents on the basis of my correction of Exhibit 94, and 61.83 per thousand feet on the other basis.

Q. Now, will you take the valuation of Mr. Rowland and others in 1884, on the basis of which the companies were consolidated, add to that the construction account since then as it appears in Complainant's Exhibit 79, and also add the increase of supplies on hand, $616,470.08, and state what total capitalization would be reached?

A. $40,500,454.99, because Rowland's valuation and that on which the companies were consolidated November 11, 1884, was $30,190,419.01 aside from franchise rights, while the construction account since then, according to Complainant's Exhibit 79 in this case, was $9,693,565.09, while the supplies as you stated were $616,470.08.

By Mr. MATHEWSON:

Q. Your total just given does not include any working capital of any sort, does it?

A. No. I make an allowance for that a little later.

3050 By Mr. BURR:

Q. What would this per thousand cubic feet of sales, and what return per thousand feet would six per cent. and eight per cent., respectively, give?

A. This is $3.05 per thousand feet of sales; and six per cent. is 18.3 cents per thousand feet; and eight per cent., is 24.4 cents. But this 18.3 cents, being a six per cent. return, added to the 57.92 cents above computed, would give a total cost of 76.22 cents; while if 24.4 cents or an eight per cent. return were added it would make 82.32 cents.

Q. If these figures were added to your estimate what would be the result?

A. If added to my estimate of 48.63 cents it would make on a six per cent. basis 66.93 cents and on an eight per cent. basis 73.03 cents.

Q. On an eight per cent. basis?

A. Yes.

Q. Have you made any computation on the basis of the figures presented by Exhibit 80 (page 348), showing the investment in the gas business, or claiming an investment in the gas business of $56,891,454.94?

A. Yes. Taking the figures from Complainant's Exhibit 80 (page 348), I find that that included investment at Astoria, according to same exhibit, $5,560,000. That I exclude and $2,000,000 due from consumers; they do not have to pay any interest on that; and $50,000 capital of the National Coke & Coal Company, and that is in all a deduction of $7,610,000. Then there would remain $49,281,454.99, which is $3.71 per thousand feet of sales. Six per cent. of this is 22.3 cents, and eight per cent. of this is 29.7 cents. If this 22.3 cents, being the six per cent. return, be added to the 57.92 cents above referred to, the total would be 80.18 cents. If 29.7 cents or an eight per cent. return be added it would make 87.62 cents. On

3051 the other hand, if the same six per cent. return on this amount, namely, 22.3 cents, were added to my computation——

By Mr. MATHEWSON:

Q. 29.7 cents, wasn't it?

A. This is at six per cent. The other was 29.7 cents at eight per cent. If 22.3 cents were added to my computation of 48.63 cents it would make 70.93 cents; and if the eight per cent., or 29.7 cents were added it would make 78.33 cents.

By Mr. BURR:

Q. Now, have you tabulated or summarized these figures.

A. I have and I will number this table 16, and there will be another table to follow that which I have got on the same page. I will put them in together as tables 16 and 17 and refer to them separately. It is table 16 that I am now referring to as being the summary of what has just been stated.

By Mr. MATHEWSON:

Q. Tables 16 and 17, isn't it?

A. Yes. Table 17 would be included as a further summary. I think I had better discuss, perhaps, a little more the table 17. The tables are as follows:

3052 TABLE 16.

Return on Capital.

Basis used.	Per M ft.	At 6% profit.	At 8% profit.
$29,266,757.48, according to Yalden, plus $9,693,565.90, plus $616,470.08	$2.20	13.2c.	17.6c.
$1,000,000 claim for working capital	.075	0.5	0.6
$40,500,454.99, according to 1884 valuation, plus $9,693,565.90, plus $616,470.08	3.05	18.3	24.4
$49,281,454.99, according to Exhibit 80, less Astoria investment, money due from consumers and capital of National Coke & Coal Company	3.71	22.3	29.7

TABLE 17.

Cost, Plus Return on Capital.

	Exhibit 94, less excluded items.		Estimate of Bemis.	
Operating cost	57.92c.		48.63c.	
	Total at 6%.	Total at 8%.	Total at 6%.	Total at 8%.
Capitalization.				
$29,266,757.48	71.12c.	75.52c.	61.83c.	66.23c.
$30,266,757.48	71.62c.	76.12c.	62.33c.	66.83c.
Including cash on hand.				
$40,500,454.99	76.22c.	82.32c.	66.93c.	73.03c.
$49,281,454.99	80.18c.	87.62c.	70.93c.	78.33c.
The last two lines will read as follows if $1,000,000 now held as consumers' deposits be added.				
$41,500,454.99	76.72c.	83.62c.	67.43c.	73.63c.
$50,281,454.99	80.68c.	88.22c.	71.43c.	73.63c

3053 By Mr. BURR:

Q. What does table 17 show?

A. Well, the first part of the table 17 is the same as I have testified to. My testimony thus far has been in explanation of table 16 and table 17 except the last two lines. Now, the last two lines or three lines of table 17 represent the addition of one million dollars for working capital which is mentioned here as now held as consumers' deposits; that is, nearly all of it is; say some nine hundred and six thousand dollars, I believe the testimony is, is so held. That makes the last two lines read as follows: $41,500,454.99 as the valuation based on the valuation of 1884 plus the addition subsequently made, plus a million dollars and represents then at six per cent. a return of 76.72 cents and at eight per cent. 83.62 cents on the basis of Exhibit 94, with those corrections that have been referred to while——

By Mr. MATHEWSON:

Q. And on the basis of your estimate of forty-eight——

A. I was going to say, on that basis, the last two columns, 67.43 on a six per cent. return and 73.63 cents on an eight per cent. return.

Q. But they are on the basis of your assumed operating costs?

A. The first two columns are not. They are on the basis of 57.92 cents as a correction for Exhibit 94.

Q. Yes?

A. And that did not make any change in your operating cost except to exclude certain items of lamp expenses, miscellaneous in-

come and a slight correction of a cent and a little over on taxes, and reduces the contingent from ten cents to enough to make the average of the previous twenty years, but did not change your general operating expenses at the station or distribution or repairs or anything of that kind. Now, the last line represents the Exhibit
3054 80 of the Complainant, $49,281,454.99, after deducting the Astoria investment, the capital of the National Coke & Coal Company, and two million dollars due from consumers, and add one million dollars for working capital, and that made 80.68 cents on a six per cent. basis; 88.22 cents on an eight per cent. basis, if you start with the slight changes that I have made in Exhibit 94; while on my larger basis of change in that exhibit it makes 71.43 cents on a six per cent. basis, and 73.63 cents on an eight per cent. basis.

By Mr. Burr:

Q. Have you prepared a table on dividends, interest and capitalization of the Massachusetts Companies in connection with the claim of Mr. Addicks and other witnesses for the complainant that dividends of 10 per cent. are allowed in Massachusetts?

A. I have. It is table 18.

This is taken from the last annual report of 1904-1905 of the Massachusetts Gas Commission. It takes up Boston and the seven largest companies outside of Boston, but two of them—Lynn and Lawrence—are omitted in some important features because the Massachusetts report omitted them. The reason of that is that Lynn and Lawrence are not the largest by any means and have a combination of gas and electric light, so that the Commission did not think it easy to separate the capitalization. I have given it as the Commission gives it in alphabetical order. It is as follows:

Dividends, Interest and Capitalization in Massachusetts.

1904-1905.

3055 The five of the seven largest companies outside of Boston, two—Lynn and Lawrence—being omitted because of lack of data.

Table 18.

Name.	Dividends.	Capital, including bonds, per 1,000 sold.	Dividends and interest per 1,000 feet sold.	Feet sold.
Cambridge	10%	2.52	21 28/100c.	439,162,251
Fall River	10%	2.54	20 87/100c.	321,119,341
Lowell	10%	2.23	19 87/100c.	482,088,600
Springfield	10%	2.38	21 69/100c.	311,678,930
Worcester	8%	2.18	20 66/100c.	410,641,700
Lawrence	6%	......	....	261,888,830
Lynn	10%	......	....	358,776,700
		1905–1906.		
Boston	8%	4.56	32 8/10c.	3,480,000,000
		(1)	(2)	(3)

(1) There are no bonds, but the above item includes 22¢ per M feet sold of Notes Payable unsecured.

(2) The Company on July 1, 1906, reduced the price by 7 15/100¢ to 85¢. On the basis of the business during the last fiscal year ending June 30, the dividends and interest to be divided next year would only be 25 65/100¢, assuming the same cost of operation per M feet and no growth in business.

(3) There were also sold to other companies 432,040,270 feet, but that was not included in the divisor used in computing the line in the table.

Boston was composed of a series of companies then, and I have taken the latest return for 1905 and 1906, not yet in print, but of which I secured a copy of the schedule just received from the company in the office of the Massachusetts Gas Commission. Eight 3056 per cent. was the dividend last year. Their capital was 4.56 cents; and I put in a note that "There are no bonds, but the above item includes 22 cents per thousand feet sold of notes payable unsecured." The dividend and interest per thousand feet sold was 32.8 cents. The number of thousand feet sold is 3,480,000,000. I also state in a note, "There were also sold to other companies 432,040,270 feet, but that was not included in the divisor used in computing the line in the table."

Now, I have another note for the 32.8 cents, to the effect that, "The Company, on July 1st, 1906, reduced the price by 7.15 cents, to 85 cents. On the basis of the business during the last fiscal year ending June 30th, the dividends and interest to be divided next year would only be 25.65 cents, assuming the same cost of operation per thousand feet and no growth in the business."

Q. Now, in Mr. Addicks' affidavit verified May 12, 1906, in this case (page 84 of the Complainant's supplementary affidavit), he quotes from the Massachusetts laws and states that the effect of those laws is that the price charged by the Massachusetts Gas & Electric Light Company "shall not, except with the written consent of the Board of Gas and Electric Light Commissioners, be fixed at less than cost, in which shall be included not less than five per cent. per annum of its cost." What are the facts in that regard?

Mr. Mathewson: Mr. Addicks has not testified here in this hearing as to that, because the statute is a public statute of the State of Massachusetts. What it says is perfectly clear to the Master, or will be, and any of us can refer to it and he can take judicial notice of it without offering it. Is there anything to be gained by having either Mr. Addicks or Professor Bemis put their construction on it in this hearing?

3057 Mr. Burr: As to the Massachusetts situation? This affidavit was used——

Mr. Mathewson: That was on a motion before the Court and the only way we could get it in was by means of an affidavit. But the Court can take judicial notice of it here.

Mr. Burr: I want to ask the Professor here if he knows what are the facts as they exist to-day in that connection.

Mr. Mathewson: I do not know quite what you mean?

The Master: Cannot you bring out the facts you want, if there is anything in the case that they are pertinent to, without referring back to the affidavits on the motion?

Mr. Burr: What I mean to say is that Mr. Addicks was probably speaking of something that existed at the time that he had in mind. I ask now, apropos of these dividends and returns and all of this sort of thing as provided by the Massachusetts law, what is the present law there?

The Master: I noticed, when Doctor Marks was testifying that he directed a great deal of attention to various statements in those affidavits. I could not see what pertinence it had here except in so far as there was testimony to the same effect before me. I do not suppose the issues on that motion for an injunction will be tried out again here.

Mr. Mathewson: Is that the Municipal statute to which you refer?

The Witness: The law has been changed since that affidavit and I was going to quote the latest law.

Mr. Mathewson: I ask, is it the Municipal Act to which you refer?

3058 The Witness: Yes.

Mr. Mathewson: There is an act in Massachusetts providing for what Municipal Gas *Gas* Companies or those owned by municipalities may earn and what they shall charge to depreciation, etc., and it is a public statute.

The Master: Why not put it in evidence?

Mr. Mathewson: If the Master please, isn't it true that the Federal Court takes judicial notice of the public statutes of all the States?

The Master: I so understand it.

Mr. Mathewson: I have assumed that and have not offered in evidence public statutes.

The Master: I so understand.

Mr. Burr: I will read this to save time:

The law referred to by Mr. Addicks was changed in Chapter 411 of the Acts and Resolves of the last session of the Massachusetts Legislature in 1906 (see Acts of 1906, p. 314) so as to read in substitution of the last clause above quoted:

"Depreciation equivalent to 3 per cent. of the cost of the plant exclusive of all land and any water power pertinent thereto or such smaller or larger amount as the Board of Gas and Electric Light Commissioners may approve * * * No part of the sum therein included for depreciation shall be used for other purposes than renewals, in excess of ordinary repairs, extensions, reconstruction, enlargements and additions."

Q. Now, I will ask you if such rule as I have just read from the Massachusetts law was applied to the New York situation as it is here in this case what would be the result?

Mr. Mathewson: What rule?

3059 Mr. Burr: That I just read.

Mr. Mathewson: That covers a good many things. Do you mean that rule if you deduct three per cent. depreciation?

The Witness: Excluding all land.

By Mr. **Burr**:

Q. If such a three per cent. rule were applied to New York what would be the result?

A. If such a three per cent. rule were to be applied to New York, bearing in mind that the land was about one-third of the total structural assets in 1884, three per cent. on the other two-thirds would have been equal to about two per cent. on the total, and this two per cent. would not have been very different for twenty years from the total actually spent in renewals, which was about three cents per thousand feet. But the Massachusetts law is not an iron-clad law. It allows the Commission to fix a smaller or larger percentage as the circumstances may require. The law covered both electric light plants and gas, and the depreciation in gas works and especially in water gas works is less than the average depreciation that you find in the Massachusetts plants, which are more largely coal gas, and electric light is a large portion of the investment, too, so that if three per cent. on everything except land was considered a fair allowance, not only for depreciation but for renewals in Massachusetts for all coal gas as well as water gas, and for electric light as well as gas, then less than that would be on that basis a fair allowance for large water gas plants.

Q. Is that all you desire to say upon that subject?

A. Yes, sir.

3060 Mr. **Mathewson**:

Q. You haven't the language of the Act here, have you, Professor?

A. I quoted a certain portion of it and I have it all in my hotel and can bring it down to-morrow. I will do so. I will try to remember to do so.

Mr. Mathewson and the witness now engage in a colloquoy relative to the above Act, which colloquoy the stenographer is directed not to report.

Q. What have you to say as to Professor Humphreys' method of reckoning depreciation for a forty-year period at one-fortieth each year instead of on a sinking fund basis?

A. Mr. Humphreys reckoned depreciation on the assumption of a forty-year life, one-fortieth a year, instead of a sum put into a sinking fund which will equal the total at the end of the forty years. In his testimony and elsewhere he has held that the result would be the same at the end of the forty years in either event, but that to take off one-fortieth each year would be somewhat better probably from the standpoint of the gas company; it would be more convenient in their bookkeeping, and perhaps more profitable, but it would more seriously burden the price of gas or the nominal cost of gas for the first part of the period. Now, that is precisely the time in the period that we do not wish to have it burdened for the reason that in fixing the price of gas it is not being fixed from year to year; it is being fixed for a period of years, and to have a form of depreciation which makes a cost larger relatively the first part of the period than the last is not, I hold, as just a method to the consumer as a system of computation which is on the sinking fund basis and which does not abnormally burden the consumer the first part of the period.

3061 From the standpoint of the company I agree with Professor Humphreys. There does not appear to be any marked difference, but from the standpoint of the consumer there certainly is a difference, especially in the first years of the period.

Q. Have you prepared a tabulation, Professor, of the figures given as to the valuation of the property of the Consolidated Gas Company, as given by the various witnesses called on its behalf?

A. Yes; and first, as to land, the valuation of Mr. Wheelock was fifteen million——

Mr. MATHEWSON: I am going to read the question again, whether it is worth while to have this witness go into a tabulation for us of what totals are?

Mr. BURR: It is to bring out his conclusion so that the whole thing as a complete statement on his part may be before the Master. It would be idle for me to produce Professor Bemis and have him give all the testimony that he has unless he has arrived at certain results, and he is now about to state the results which he has arrived at.

The MASTER: The objection to this kind of testimony, it seems to me, Mr. Burr, is that it is more properly to be incorporated in a brief or argument, if it is based entirely on evidence already in the case. I should think that unless Professor Bemis gives you his conclusions based on those figures and on independent researches of his own that the brief is the place for that rather than the testimony.

Mr. BURR: But this is the result of his rearrangement of the figures produced by the Company.

The MASTER: If he can detect any flaws in them that he can testify about that is another thing.

3062 Mr. BURR: He has testified, taking the figures presented by the various witnesses of the Company and rearranged them as they should be arranged, in his opinion. Now this is the rearrangement he wishes to present as to the values given by the various witnesses as to the various properties of the Company.

The MASTER: Well, I will allow it to go in, Mr. Mathewson, and give you an exception.

Mr. MATHEWSON: The Master does not, I assume, allow the witness by this ruling to testify what in his judgment value of all the property of the Company is?

Mr. BURR: There is no such intention to ask him that.

The MASTER: As I said the other day, Professor Bemis from the standpoint of a statistician is going to show that there are various errors in the method of getting at your results, independent of any facts of his own.

The WITNESS: Well, the land has been testified to by Messrs. Preiss and Green as $15,895,609 and according to Wheelock (page 1113)—I have forgoten the other pages—$15,651,500. The manufacturing plant has been testified to by Mr. Mayer at—first let me give the larger figure as I did before—testified to by Mr. Addicks as $16,087,428.72.

Q. What was testified to?

A. The value of it.

Q. Of what?

A. Of the plant. But he also stated in his affidavit on notice of motion of the Consolidated Gas Company (page 8) that the present reproduction value was $18,771,000, or $2,683,571.28, higher than he had otherwise testified.

Mr. MATHEWSON: Now I call the Master's attention to the fact that Mr. Addicks in the affidavit mentioned did not state his valu- 3063 ation at $18,771,000. On the contrary he says present value as appears by the affidavits of William H. Bradley and Colin C. Simpson, also cost of reproduction, in a certain figure. Now, Mr. Simpson and Mr. Bradley put in their affidavits what they considered the value to be and he used the total of those.

Mr. BURR: You might add to the question that Mr. Addicks, in his affidavit, basing his statement on the affidavits of Mr. Simpson and Mr. Bradley.

Mr. MATHEWSON: But neither these papers nor the figures are in evidence and have not been testified to by Mr. Addicks and I don't see what the witness is gaining by comparing Mr. Addicks' estimate of the present value with Mr. Bradley's estimate of the cost of reproduction.

Mr. BURR: Do you mean to say all the statements made before Judge Lacombe were idle and unnecessary and not to be referred to hereafter?

Mr. MATHEWSON: No, but I say they are different and you must not put in Mr. Addicks' mouth the estimate of Mr. Bradley and then proceed to say it emanated from Mr. Addicks.

Mr. BURR: That is a mistake. It is the estimate of Mr. Addicks based upon the statements of Mr. Bradley and Mr. Simpson. I will put it that way.

The WITNESS: I prefer to correct it in that way. There is a difference between this $18,771,000 and Mr. Mayer's estimate which I have here at $15,515,578, a difference of $3,255,422. The holders in Mr. Mayer's statements should be added and just about balance them with what has been given in this other affidavit, the holders $3,600,215. There was only one series of estimates on the 3064 holders. Then mains $12,600,000 was the figure used by Mr. Humphreys in the testimony (pages 2187-8), and Mr. Simpson (page 289), gave it just about the same $12,636,150. The services testified to by Mr. Simpson (page 291) as $1,994,034.35, and the meters were testified to in Exhibit 8 (page 414) as $4,100,000—meters and other personal property.

Mr. MATHEWSON: Mr. Carter subsequently gave the exact figure. That was simply what he had in mind. It was about $4,200,000 slightly beyond that.

The WITNESS: What was you- personal property?

Mr. MATHEWSON: Scows, horses, automobiles and office furniture; but about $3,000,000 out of the $4,000,000 and over was for meters. He gave the exact figure later, the cost of reproduction on the basis of present prices, and it was not much different from what you have there.

The WITNESS: The total that I have here, and taking Mr. Mayer's figures on plants and holders and the other figures as I have read them and continuing to use $4,100,000 for meters and other personal property as the only figures absolutely at hand at the moment, gives a total of $53,461,327.35. That may be slightly in error but I think it is substantially what the figures total up.

By Mr. MATHEWSON:

Q. And whose figures, if I may ask, in order that we may be clear?

A. Yes. They were the figures on land of Mr. Wheelock; on plant and holders of Mr. Mayer; on mains of Mr. Humphreys; on meters and services of Mr. Simpson—Well, I don't
know—services, Mr. Simpson; meters $4,100,000, Carter. A
3065 more official estimate would take Mr. Simpson's figure doubt-
less on mains because Mr. Humphreys was only attempting to give a rough approximation and Mr. Simpson's were simply $36,150 higher. Perhaps I will use that, which will make the total $53,497,477.35; and if the later testimony gave another $100,000 as Mr. Mathewson asserts, covering meters and other personal property, of course that must be added in, and if we take that as approximately $100,000, that would make $53,600,000 approximately, and I think perhaps I would let it stay at that point now in the absence of any further information.

Now, that is, as I understand it, the inventoried value according to the Complainant's witnesses of the property to-day. Its present value, if I have totaled the figures up from the testimony correctly, and should be compared in my opinion with the inventory of 1884, plus the additions made since then, as given in Complainant's Exhibit 79 (page 347 A); that valuation given then.

By Mr. BURR:

Q. When?

A. For November 11, 1884, was $30,190,419.01. That is the valuation of the physical property without reference to franchise rights, just as the same exists, as it appears on Exhibit 69. Now there has been an increase according to the testimony in this case on the basis of the Complainant's witnesses, from $30,190,419 to approximately $53,600,000 or an increase according to their statements, of $23,409,581. Of this amount they have explained in Exhibit 79 that $9,693,565.90 was charged to construction. Then there remains a difference of $13,716,015.10 which they claim has been the increase
in the value of their property aside from what they nominally
3066 put into construction in the last twenty-one years. Now, if
that be the case, and if they are entited to earn interest or profits on that, then to that extent the $13,716,000 must come out of the total that you have nominally spent for repairs and renewals during those twenty wears, which I will give in a moment. The total was obtained from State's Exhibit L (pages 415-18). According to that exhibit they have spent for repairs and renewals—I might perhaps have also gotten it if I had thought of it, from this other

exhibit (79), but I have this Exhibit L before me. According to that exhibit, bottom of page 417, they spent for repairs and renewals $16,418,223.03, which appears to have been only up to the close of 1904, and when adding in 1905, which is given. I have the figures of 1905 here; I added them in.

Mr. MATHEWSON: What is the total?

The WITNESS: The total up to the close of 1904 is given on the bottom of page 447 as $16,118,225.03. Now, I add to that for 1905 the calendar year, there are two months overlapping there—two months additional. I find from page 418 the amount $974,289.65, which makes a total of $17,392,512.68. In other words, with the expenditure of $17,392,512.68 chargeable to the repairs and renewals they claim their property has increased in value about $13,716,015.10, so that of that total increase——

Mr. MATHEWSON: We do not make any such claim at all.

Mr. BURR: If you do not you can show it.

Mr. KIRBY: Then it would appear.

Mr. MATHEWSON: No, it would not. I won't let that pass.

The WITNESS: Then the total increase in value by the entire amount spent for repairs and renewals, $4,676,497.58. That 3067 is on the supposition that the witnesses of the complainant are correct in those valuations in the present valuations. Of course I am taking their testimony for the purpose of this computation as correct, and also assuming, which I do not assume myself—I do not endorse—that they are entitled to earn a return or capitalize any increase which may have been got from appreciation in their land or from the street paving, but for the present purpose I have taken, as I said, their present testimony, and on that basis there is only $4,676,497.58 that was really taken out of the gas business and is not for any purpose now found in the structural values. Now, dividing that by the total sales——

By Mr. MATHEWSON:

Q. That is after eliminating the appreciation of land?

A. That is after eliminating repairs and renewals, which were $13,716,015.10, according to the Exhibit L. Now, dividing this into the 164,076,200,000 feet of sales, during those twenty-one years, gives a figure of 3.46 cents a thousand feet. In other words, on the basis of their claims of the increase in value of their plant then there has been a loss to the company each year that had to be made up in some form, not of 10.89 cents, but only 3.46 cents.

Now, I want to make myself very clear on that. I do not myself believe that there has been any such increase in the value of their property, and if there has, I do not believe such portion of it at least that has come from appreciation in land or street paving can be made the basis of charging for gas. It cannot be capitalized in either Massachusetts or Great Britain.

3068 By the MASTER:

Q. What do you mean by appreciation in land and street paving? Do you mean the increased cost of removing street paving when they have to lay down mains?

A. I may suppose I have one million dollars invested in street mains in a plant that I own. I am selling gas to the consumers, the people of the city. The city decides to pave over my mains and the money for it is raised by taxes paid for chiefly by the people who use the gas, the consumers, and by reason of that paving it would cost two million dollars to duplicate the mains. Have I a right to raise the price of gas to the consumers who have paved over my mains by their taxes, because they have done it. Have I a right to add a million dollars to the capitalization of my gas plant because the consumers through their taxes have put a paving over it? It looks to me absolutely ridiculous, and yet I fully admit that it would cost more to duplicate that paving than originally. There is no dispute as to that. And as to the appreciation in land, I make the remark that there is nothing in the law of England or Massachusetts which allows an increase of capitalization for that appreciation.

Mr. Mathewson: You have already said that once, Professor.

The Witness: I will add a statement that is new in this case. When a company sells out to another there may be some precedent for capitalizing any increase in the value of the land. That I will not undertake to say. But I remark that I find nothing in the precedents in Great Britain or Massachusetts, and nothing in my own view, and I do not seem to find any theory which seems to justify making the consumer pay any more for gas on that account.

3069 There are other reasons why I have not thought it necessary to allow for depreciation, contingencies and repairs more than 10.89, the experience of the twenty years preceding 1905. One reason is brought out in what I have just given, that the 10.89 cents seems to have been so much more than sufficient. But other reasons appeared in the testimony, for example, Mr. Bradley in his testimony before the State Gas Commission, in page 1548, was asked: "What was the condition——"

The Master: Is that testimony in evidence here?

Mr. Burr: He has practically testified the same thing here with regard to the condition of the plant. Is not that what you refer to?

The Witness: Yes.

Mr. Mathewson: Then why not take it from the present testimony instead of outside records?

The Witness: I happened to have this citation here.

The Master: Either take it from the evidence here or put that in evidence from which you take it.

Mr. Burr: The point to which the Professor refers I desire to read into the testimony. It is from the testimony given by Mr. Bradley before the Gas Commission:

"Q. What was the condition, Mr. Bradley, of the works and plants of the Consolidated Gas Company when the Company was formed and took over these plants in 1884, if you know? A. They were in good condition. Operating continuously and successfully.

3070 Q. What is their present condition relatively? A. They are in rather better condition now than they were at that time.

Q. Are they producing as much gas as they did then or more? A. Almost twice as much if not quite. Q. And at a higher or lower rate of cost of manufacture? A. Oh, generally, a lower rate."

Q. You may continue, Mr. Bemis.

A. Then Mr. Carter in Complainant's affidavit in rebuttal pages 29-30, says, "Substantially all services included therein have been replaced by services of two or three times the capacity and much more expensive. Plants have been reconstructed and it would lead to a wholly inadequate and misleading result if such assets were taken even at their original cost to their constituent companies plus only additional assets since acquired, leaving out of the consideration the fact that the original assets have been largely changed in character and improved in value without additional charge to capital account since they were so originally acquired. Thus, while complainant's services were valued at $1,034,241.41, being part of said $29,994,000, all complainant's services are now carried on its books at $1,212,071.09, an increase of $177,829.68, in spite of the fact that the gas distributed by complainant has increased from less than four billion feet in 1885 to over thirteen billion feet in 1905. Said $177,829.68 represents merely additional services, and the services existing in 1884 valued at $1,034,241.41 have all been replaced with larger and more expensive services with no addition whatsoever to the capital account, the complainant having expended in the renewals and repairs there, since 1884, the sum of $1,831,325.99."

3071 In other words, the testimony that has come to my attention since I testified last Winter indicates that the structural value may be somewhat greater than I then thought, while there should be no allowance, as I then gave of three cents extra for extra contingent expenses, and further tends to show that the 10.89 cents has partly gone into construction. Therefore on that basis, 10.89 is a high allowance for the future for all items covered by repairs, renewals, depreciation and contingencies for even that amount in the last twenty years has made their plant according to the testimony in this case, much better than it was before. This instance is the most thorough going one I have ever come across of a presentation of data of the repairs, renewals and depreciation matter for a long period of time, and if we can only be sure that the records are in every way what the complainant's witnesses seem to think they are in this matter, it has a very important bearing on that 10.89 cents.

Q. Have you a statement showing what have been the average expenditures on the items of repairs, renewals and depreciation for the last eleven years as compared with the previous eleven years?

A. I have. There have been twenty-two years covered by the exhibit.

Q. Exhibit 79?

A. State Exhibit L, pages 415-418. Twenty-two years, beginning with 1864 and ending with 1905. I find that during the first eleven years of that period the sales of gas as given in Complainant's Exhibit 85, page 358, amounted to 56,878,689,000 cubic feet, and the amount expended for repairs and renewals was $6,967,874.39 or 12.25 cents per thousand feet of gas sold. Likewise during the last eleven years the sales were 107,197,511,000 feet and the expenditure for repairs and renewals were $10,424,638.29 or 9.73 cents per thousand feet of gas sold, a reduction from the first eleven 3072 years where it was 12.25 cents, and 9.73 cents is lower than the 10.89 cents which I have used by the amount of 1.16 cents of 1 1-6 cents.

Q. Have you made a study of the effect of price reductions in New York from 1885 to 1905, inclusive?

A. Yes.

Q. And have you prepared a chart upon that subject?

A. Yes. This relates only to the Consolidated Gas Company, and is an attempt to show graphically the changes in price and the changes in consumption each year without any attempt to estimate per capita charges, but simply the absolute changes. The heavy line represents the fall in price from year to year, starting with about $1.70 in 1885 and going down to almost 80 cents in 1900 and coming up again to one dollar. The other broken line represents the increase in consumption in numbers of billions of feet from year to year, and the chief points I notice in that chart are these, that when the price fell from 1885 to 1887 it led to, I think, or was certainly accompanied by, a large increase in consumption, as was indicated by the rise of the broken line. That rise continued, as usually happens in such cases, after the continuance of the reduction had stopped, having got to the lower point, the people more and more used gas. But when there was no further reduction after 1892, there was practically no increase in consumption during the next four or five years. That was undoubtedly, however, to some extent, by another cause, the financial depression. But after 1897, when the price sharply fell to 1900 there was another sharp increase in consumption. When in 1901 the price rose again, there was only a temporary check, a slight check to the increase in consumption, but not a large increase, showing that there are other causes operating to stimulate the use of gas, and which are very much of course 3073 in favor of the company, for it grows largely even without changes in price; simply changes in price precipitate further changes in consumption. Of course, in 1903 came the coal famine, which kept the increase of consumption going, but during the last year the consumption has not been increasing so fast. I infer from that, however, while taking into account other facts we know of the history, that while change in price is not the only factor by any means which affects the consumption of gas, it is one factor, and a factor which can always be relied upon to have a marked influence. And I present this chart, not in conflict but in harmony with what Professor Marks presented. It is intended to confine itself to the one point of consumption, without complicating it, perhaps, with the question of per capita consumption and all the companies. This is for the Consolidated Company alone.

By Mr. **Mathewson**:

Q. I see "Professor Wm. D. Marks" appears on this chart. Was he simply the draftsman or a collaborator in the result?

A. I will frankly state that after I had prepared the chart I consulted with him as to how I could secure a blue print and he had draftsmen at his disposal who were working for the city, I suppose, in this case, who were put at my disposal by Professor Marks, very kindly, to work out the blue print from my figures. I had this same chart, which I showed the Gas Commission a year ago nearly, but it was not in blue print form.

By the **Master**:

Q. Will you explain to me why it appears on this chart that the
consumption of gas is *not* the highest when the price is the
3074 highest? As I understand there is the high price, $1.70, and
now on the opposite side——

A. That is the low price.

Q. You have sales in billions of feet. According to that you have thirteen billions of sales when the price is $1.70 and only six billions when it is one dollar?

A. When the price is $1.70 you follow down here opposite to this line and the sales are shown to be four billions. These figures, 4, 5, 6, 7, and so on up to 13, are billions of feet, and refer to the broken line, while these figures of price on this column refer to the heavy line, and you have to read the two together. It is a little confusing, but it is about the best way to work it out I could think of. So, if the price was $1.70 the sales were down here in the broken line to four billion feet, each line representing a year. When the price had fallen in 1887, to this point, which is between $1.30 and $1.20, about $1.26, the sales had risen to nearly that point, which was five billion (indicating), and continued to rise rapidly, as is usual with such cases, that the reduction in price is not always felt the first year, but continues to be felt for some length of time; and although the price afterwards remained stationary, yet the consumption continued to increase up to that point.

Mr. **Burr**: Which point are you referring to?

The **Witness**: To the year 1903. Then there were two causes which——

By Mr. **Burr**:

Q. You might explain the situation each year as it appears by that chart.

A. Well, that was such a continuous condition that it was about the same from year to year. Now the consumption actually fell off
a little from 1893 to 1895. The odd years are put at the top
3075 and the even years down at the bottom for convenience of
those lines, that is all. The falling off was not a natural condition, because I do not claim that that falling off was due to the fact of the price, as the price was not changed much, but there came a depreciation in business in 1893, 1894 and 1895, and anything which affects business more or less affects the use of gas, although not as

much as it does some things; but it did fall off a little and the price did not change much. It fluctuated a little but not much. In 1896 before the depression was hardly over, the price began to fall and it fell very rapidly, until it got down finally in 1900 to a point which was a little over eighty cents, an average of eighty-two or eighty-three cents, I think it was, and then there came a great upward movement of sales. Up to that point, everything looked very natural, but here comes the exception. Here comes the point that looks strange, namely, that when the price came back to $1 as it did after the close of the gas war, that it did not much change the consumption. It did just a little, and then it kept on. But there was another factor that came in here, namely, the coal strike, which had a great effect. But there is another factor which is always operating that there is a tendency in all communities for gas to be used more and more. Granted a stationary price, gas is being more and more used for two or three reasons. It is being used chiefly for heating and cooking, more and more, with the growth of high buildings, as it becomes more and more of a nuisance to bother with coal and ashes, and it is convenient to have it for night and morning, bedroom and bathroom heating; of course, we all understand about those things. So that all that is claimed is that while the normal tendency is for the consumption of gas to increase, and change is only affected by 3076 either depression or on the other hand improved by coal strikes or coal famine or something of that kind, yet working in and through it all, changes in price have a further affect, a reduction in price having a tendency to accelerate the increase that otherwise would occur, and that factor there accompanied with this and then this fact that another decline was accompanied by another big increase, rather, I think, tends to bear that out. That is not the only fact I am going to adduce in that connection, but it is simply one tending to confirm my views.

Mr. **Burr**: I offer this chart in evidence.

Paper received and marked City's Exhibit 57.

At this point a recess was taken until 2.15 p. m.

After Recess.

The **Master**: Gentlemen, I have to advise you that some of my other affairs are getting so urgent that I have got to give them a little attention, and next week I will have to make some change in our hearings. I have another proceeding in which I have to do some work, and we will have to begin a little later in the morning perhaps and sit later in the afternoon next week.

Mr. **Burr**: About what hour have you in mind?

The **Master**: This other matter of mine will go on every day next week except Monday, from 10:30 to 12 o'clock, and I thought we would go on here, say, from 12 to 1.30 and then perhaps from 2.30 to 5.

3077 Mr. **Burr**: Would you prefer to go on from 1 to 6?

Mr. **Mathewson**: That would hardly suit my convenience, as I have to go out of town.

The **Master**: Also I shall have to have a short session to-morrow, as I have to be away to-morrow afternoon. We can go on from 11 o'clock to 1 to-morrow, or at 10.30, if you can go on at that time.

Mr. **Burr**: We had better make it from 11 to 1, as I have some other matters to attend to.

The **Master**: Then we will go on from 11 o'clock to 1 to-morrow, and next week we will change the hours. And if you gentlemen of the defense find that you are running behind to an undue degree on your time allowance, I will help you out by sitting Saturdays at any time you like.

Edward W. Bemis resumed.

By Mr. **Burr**:

Q. Have you made a study of the effect of reductions in price in Massachusetts for the last twelve years?

A. Yes, I have.

Q. What do your studies show as to Boston?

Mr. **Mathewson**: I have not any objection to the Professor showing what the results in Boston are, but I think when he comes to say that they are due to the fall in price, that that is a conclusion he ought not to draw. He can state anything that happened.

Mr. **Burr**: In other words, you differ with his conclusions.

Mr. **Mathewson**: I may materially differ, yes.

3078 The **Witness**: I will present at this time a blue print for Boston, corresponding to the one for New York, arranged on the same basis and giving the changes in price in a heavy line since 1884, and in a broken line the changes in consumption. I would state that the figures at the top of the page representing the odd years and those at the bottom representing the even years should in every case be taken as only the first half of the year. The fiscal year in Massachusetts ends June 30th, so when at the top of the page is the figure 1887, it should be taken as meaning the fiscal year beginning July 1st, 1887, and more properly therefore it might have read, and I intended it should read, 1887-8, and so for every other year, 1891-2, 1892-3, etc., but in the haste of preparation that was not done; but it is clear enough with that explanation.

Now, in another blue print which I will present in a few minutes will be given, I think, the detailed figures; but here it is graphically shown, and it will be noticed that it is for the same period as the table for the Consolidated Gas Company in New York.

Q. You might produce them both and explain them at the same time?

A. I think I can explain this better now.

By Mr. **Mathewson**:

Q. What company in Boston is this?

A. This is a combination from the Massachusetts Gas Commission report of the six companies selling gas in Boston and which have lately been consolidated into one, namely, the Boston, the Brookline, Dorchester, Jamaica Plain, Roxborough and South Boston. It ex-

cludes the Bay State, for that company practically sold no gas except to other companies. This is solely based on the sales to private consumers and the city and is not at all based—in fact, it excludes sales by one company to another, such as frequently occurred
3079 in Boston during that time. I reached my data relative to prices of gas in this way. I took the Massachusetts Gas Commission report, which began at this time when I began my chart, that is, the charts begin with the report of the Commission, and for each year I took the sales of gas in that year for each company to private consumers and added them together, and thereby got the broken or dotted line indicating sales. Now, in getting the other heavy line indicating price, I took the total receipts of each company for the sales of gas to private consumers and the city and added them together, taking each year by itself. Therefore, I would have in one column the monetary receipts of each company and a total. I divided that total by the number of feet sold each year by those six companies, and I thereby reached the figure of a little less than $1.60 in 1885 and running down to 92.2 cents to be accurate, 92 cents, during the year ending June 30th, 1906.

Now it will be observed that there is a very marked relation here between decline in price and increase in sales. As the price fell from 1885 to 1890, the consumption rose; and when the price rose again, as it did from 1890 to 1891, the average price, the increase in sales was checked. When the price again fell in 1892, with the advent of the Brookline Company, and the competition which followed it, so that the price fell from a point near $1.35 to about $1 between 1892 to 1895, the sales rapidly jumped up from a little over a billion and a half to somewhat over two billion and a quarter feet. It will then be noticed that the price remained stationary at one dollar until a year ago. It will be further noticed that the consumption was checked for a little while. There would naturally have been some increase in consumption if it had not been for the depression of
3080 1896-7. Then there came a moderate increase in consumption until the coal famine, and then a rapid increase.

By Mr. Burr:

Q. The coal famine of what year?

A. The coal famine of 1902-3, or the coal famine of 1903-4, about 1903. Then after the famine was over, there came a reduction of sales, partly connected doubtless with the fact that there had been such a rapid expansion, an abnormal and unnatural expansion, the year before on account of the lack of coal. That represents that year 1902-3. Then with the reduction last year from $1 to 92 cents came a jump upward in consumption.

Q. What has been the reduction to which you refer?

A. The reduction was 8 cents during the last year on this chart. Since June 30th, there has been a further reduction from 92 cents to 85 cents.

Q. In Boston?

A. Yes, and it took effect July 1st, but the results of that are not yet to be had.

Q. That is the result as to increased consumption.
A. Certainly. I suppose——

By Mr. Mathewson:

Q. It is wholly experimental, and the Company can restore the price to 90 cents at any time it sees fit?
A. Yes. It seems satisfied to let it remain as it is.
Q. It has only just started?
A. It has been in operation four or five months.

By Mr. Burr:

Q. You mean you have no data to show the effect?
A. No, but have no reason to understand that they are going to raise the price.

3081 By Mr. Mathewson:

Q. And no effect on net earnings, either?
A. No. This chart then seems to tend in the same direction, very decidedly as the one on New York, showing that where there are no abnormal conditions such as a great depression or on the other hand a coal famine that price reduction has a marked effect on consumption. Now I have prepared for the same City——

Mr. Burr: Before you go into the other chart, I will offer this chart in evidence.

Paper received and marked City's Exhibit No. 58.

The Witness: Now I have another chart giving the per capita consumption. This chart——
Q. What does S. C. stand for?
A. That is supposed to stand for State Census. Massachusetts has a State Census.
Q. And "E" is estimated?
A. Yes. They have a census every five years in Massachusetts. A State Census in the years 1885, 1895 and 1905, and the United States Census in 1890 and 1900, and in between is an estimate. The table at the top gives the average price such as I described before and the total sales. The price line is the same as in the previous chart. The only difference in the two charts is that the broken line relates to sales per capita instead of sales in millions of feet, and is a still stronger confirmation of my position as to the striking relation between reduction in price and increase in sales. It will be noticed, for example, that when the price fell from $1.57 at the beginning of the chart in the year 1885-6 to $1.29 in the year 1890-1 that the sales increased per capita from 3,288 to 3,916. When the price rose as it did to $1.36 in 1891-2 the consumption actually fell off per capita and then when the price was rapidly reduced to $1, which it reached in the year 1895-6 the consumption per capita rapidly rose. Then the price remained stationary——

3082

By the Master:

Q. What was the last you stated?
A. The consumption rapidly increased, this line rapidly rose when the price fell.

Q. But what years did you say?

A. From the year—really that is the year 1892-3. From that point it began to fall from the year 1892, the year beginning June 30th, 1891, that is when it began to fall and it reached the bottom in the year 1895-6, the year beginning July 1st, 1895, and when that fell the consumption rapidly increased.

Q. It commenced to rise in 1893 and went up steadily to 1895?

A. Yes.

Q. What about the momentum which always follows an increase? It seems to have exhausted itself in 1895, does it not?

A. Yes. I stated in connection with the other chart when I reached that year that the depression of business beginning in 1893-4 and running on through for three years had a marked effect on consumption or some effect, as it naturally would have. I have been careful to state that the state of business has an effect on the consumption of gas and also on the condition of the coal market, but that the price of gas also has an effect, and a very marked effect. Now the price remaining uniform from the year 1895 until last year, we would naturally have expected an increase, but only a moderate increase per capita in sales beginning June 30th, 1895. As a matter of fact, we do not find any increase but a decrease for three years and then an increase, which decrease I attribute to the depression;
the first part of the increase to the gradual recovery from that
3083 depression, and the last part of the increase, just at the very
top there in 1903, to the coal famine. Then that peak was followed by a depression which is an indication of the abnormally rapid increase which had preceded it in the coal famine, so that the consumption finally in the year 1904-5 reached the point indicated on this chart next to the last column. Then the fall last year in price of eight cents was accompanied by that very rapid increase of per capita sales of 5,152 to 5,626 feet, in other words, an increase of 474 feet per capita. If we were to draw that chart with reference to a normal condition without change in price and without any coal famine or depression, we would connect by a straight line the peak in the year 1895——

Mr. Mathewson: Say you would, not "we would."

The Witness: I would, with the condition as it was in the beginning of last year. In other words, it would be a line connecting this peak with that point there (indicating).

Mr. Burr: Specify it, for the record.

Mr. Mathewson: The peak of 1895 to the peak of 1902?

The Witness: No, with the beginning of 1905 and that point. That peak was abnormal, the peak of 1902-3 was abnormal on account of the coal famine, just as the depression of 1898-9 was abnormal on account of the industrial depression in the earlier period, and the coal famine in the later period somewhat affected it, otherwise there would have been a normal line running from the peak which was reached in 1895-6 to the point at which this dotted line
stood in the year 1904-5. Then the very rapid increase the
3084 last year, which means a per capita increase, as I have said,
from 5,152 feet to 5,626 feet was connected with the fall in

price from $1 to 92 cents. I believe there would have been some increase without that fall in price, but not as great an increase as occurred. It was much greater than the average increase that had occurred during the previous period when the price remained stationary, which will be noticed from the table, the right hand column of the table——

Mr. Mathewson: Is that in evidence yet?

The Witness: Everything on this chart, I suppose.

Mr. Burr: I offer it in evidence now.

Paper received and marked City's Exhibit No. 59.

The Witness: It will be noticed that the first year when the price reached $1 on City's Exhibit 59, namely in the year 1895-6 the yearly consumption per capita was 4,541 feet. It will be noticed that in next to the last year, that is the year beginning July 1st, 1904, it was 5,152 feet, an increase of only 611 feet in nine years during which the price remained stationary or 67 feet per capita per year. I think that is a fair statement to take because it included both the period of industrial depression and the period of the coal famine. Now compare that——

By the Master:

Q. How much did you say it increased in 1896?

A. Only 67 feet per year. It increased 611 feet in the nine years, but that was an average of 67 feet a year. From this point to that point (indicating).

Q. You mean from the peak of 1895——

A. To the depression just before the last reduction in price,
3085 during the time, in other words, when the price remained stationary. Now, I want to compare that with two other periods, first, the period of last year in which the price fell as it did 8 cents. During that period the per capita sales increased from 5,152 feet to 5,626 feet, or 474 feet, about seven times as rapid a rate.

Now, let me compare during the period from 1885, that is the year beginning July 1st, 1885, to the time when the price became stationary, which was the year beginning July 1st, 1895. Now, during that period the per capita sales increased from 3,288 feet to 3,788 feet, a period of nine years, and there *there* was an increase per capita of about the same amount of 500 feet per capita or about 55½ feet per year. Now, these two charts, Exhibits 58 and 59, both relate to Boston and simply tend to confirm the chart I offered this morning with reference to New York.

By Mr. Burr:

Q. In what respect?

A. As to a relation between price reduction and increase of consumption. I have one further point upon that matter which I have here. In the year 1892-'3 when the average price in Boston was $1.35 the sales were 1,645,085,702 feet. In the year 1895-'6 when the price was $1.00, which was only three years later, the sales were 2,325,454,855 feet. And what is perhaps more remarkable is that the receipts in dollars increased, that despite the fall of so large an amount as 35 cents in price——

Mr. Mathewson: In 1892-'3 was the average $1.35?

The Witness: The price in the year 1892-'3, which appears there as 1892, because it is, as I stated a little while ago, 3086 really only the first half of the year, which is told by the figures at the top—in the year beginning July 1st, 1892, and known in the chart as 1892, the average price was $1.35 and in the year beginning July 1st, 1895, known in that chart as the year 1895, the price was $1.00.

By Mr. Burr:

Q. Referring to City's Exhibit 59?

A. Yes. Now my point is, that despite the enormous fall in price of 35 cents, the receipts in money of these six companies in Boston increased from $2,221,156.07 to $2,325,067.09, an increase of $113,911.02 or a little over five per cent. That is all I have on Boston.

Q. What do your studies show as to other Massachusetts cities in this connection?

A. I here have a table which I would present.

By Mr. Mathewson:

Q. Is that the same table which you had before the Gas Commission?

A. Somewhat revised, but the same principle. It is brought up to date.

Q. The same cities?

A. Being brought up to date, it has two or three others, I think. This table is prepared from a study of the effect of every reduction in price in Massachusetts outside of Boston since June 30, 1893, and ending with the last printed report of the Massachusetts Gas Commission for the year ending June 30, 1905. I have compared the price and the sales of gas in feet and in dollars and the profit as reported to the Commission the year before each reduction with the year after each reduction. Any reductions made during the past year have been omitted because the results can only be learned when the next report of the Gas Commission appears next April. I have therefore used the year 1905 to check up any reductions of the previous 3087 year or two. Twenty places and thirty-two cases of reduction have been found in which the reduction in price exceeded eight cents, and I have only attempted to cover those, only such cases have been stated. It is possible that three or four small companies whose reductions have not exceeded ten cents in price may have been unintentionally omitted, but to the best of my knowledge and belief, I have included every reduction exceeding eight cents and certainly, I believe, every one exceeding nine or ten cents during those twelve years, in other words, I have omitted nothing for the sake of proving a point, but have attempted to include everything, and if anything has been omitted it has been purely unintentional.

3088

TABLE 19.

Effect of Reduction in Price in Massachusetts, Outside of Boston, from June 30, 1894, to June 30, 1905.

	Year.	Price.	No. of 1000 Ft. Sold.	Year.	Price.	No. of 1000 Ft. Sold.
Adams	1902-3	$1.80	6,095	1904-5	$1.51	5,261

ERTICAL IN BOOK

3092 The WITNESS: Now it first appears that the price the year before the reduction averaged $1.20 per thousand feet and the year after the reduction $1.07, a reduction of 13 cents or 10.83 per cent. This average price was obtained by dividing the total sales into the total receipts the year before the reduction and the year after the reduction. The total sales of gas in the two years increased from 3,063,461,000 feet to 3,949,334,000 feet or 28.92 per cent. while the price obtained for the gas, despite the reduction in price, increased from $3,682,296.61 to $4,215,684.84 or 14.48 per cent. Still more astonishing is the fact that thanks to the large increase in consumption even the profits did not fall at all but actually increased a trifle, from $1,445,750.64 to $1,454,636.48, an increase of .63 of one per cent.

By Mr. MATHEWSON:

Q. About $9,000?

A. Yes. It will of course be urged that to take care of this increased amount of gas some new capital must have been required. But it is a well known fact in the gas business that an increase of consumption following a reduction in price does not involve a proportionate increase in capital. Very few new mains are necessary and scarcely any new land or buildings, and not even a proportionate increase in the manufacturing plant. The great increase comes in the services and meters, particularly the meters. It will be observed that the consumption of the Consolidated Gas Company according to Complainant's Exhibit 85 increased from 3,942,433,000 feet in 1885 to 13,283,164,000 feet in 1905, or over three fold, and the amount manufactured increased to about 10,000,000,000 feet or or over twice as much, while expenditures on construction according to Complainant's Exhibit 79, increased only from $30,190,-
3093 419.01 on November 11th, 1884, to $39,883,984.91 on October 31st, 1905. This increase of $9,693,565.90 was an increase of less than one-third. This increase of over two-fold in the production and of threefold in the sales with an increase of only one-third in the construction account was larger than usual, but it is the testimony in this particular case with respect to the Consolidated Gas Company. In other words, the amount invested in construction by the Consolidated Gas Company in 1885, according to their testimony was $7.66 per thousand feet and in 1905 only $3, aside from the gas they bought. That is based on sales, even if we add the $616,470.08 increase of supplies on hand in 1905 over 1884, it would only mean less than 5 cents increase per thousand feet of sales. Put in another way, 6 per cent. on the investment in 1885 would mean 46 cents per thousand feet of sales and in 1905 18.3 cents upon the invesment as above computed. The fact then, that the profits in Massachusetts remained stationary or even very slightly increased with a reduction of 13 cents in price can only to a very moderate extent have been accompanied by any necessary increase in capital. The year after the reduction in price these twenty Massachusetts companies, in thirty-two instances, were as well off as the year before the reduction barring perhaps, three to five cents more

required for a return on capital. From this study I draw the conclusion that if the companies can stand a reduction of any given amount, they can stand a reduction of at least eight or ten cents more by reason of the large increase in business sure to follow without any proportionate increase in expenses, always providing of course that the reduction does not go down to the operating cost. If then, the Consolidated Gas Company could stand a reduction to 85 cents on the basis of last year's business, it could stand a reduction to 75 cents on the basis of the business that would surely
3094 come to it during the next two years after the reduction.

Q. What have you found in Cleveland in this respect?

The WITNESS: In that city——

Mr. MATHEWSON: Don't you think we have gone far enough if you take the Eastern Cities? Is there any particular advantage in going to Cleveland?

Mr. BURR: The witness resides in Cleveland and may have some special knowledge with regard to the conditions existing there in this regard that he has been testifying about.

The WITNESS: In Cleveland with their artificial gas at seventy-five cents the consumption in 1903 was about two billion feet or 5,000 feet per capita. With the introduction of natural gas at 30 cents, which is equivalent to artificial gas at 18 cents, owing to the difference in the calorific power, the consumption of all kinds of gas increased from 5,000 to 12,000 feet per year per capita, in three years. To say nothing of the use of gas for manufactures. The consumption per meter which was about 25,000 feet with artificial gas, is about 100,000 feet of natural gas, as I am told by the manager of the natural gas company. If such an increase in the use of gas could come under the extreme conditions mentioned, which of course are more extreme than could be expected in the case of artificial gas alone, it is evident that the theory that no large increase can be expected with reductions in the price and that there will be no increase per meter is based on too narrow a generalization. In other words, the nearer you approach the natural gas conditions the more largely gas will be used for fuel purposes and the greater its per capita consumption. The peculiar feature about reduc-
3095 tion in price is the stimulus it gives also to new consumers along the lines of mains. If the reduction is much below a dollar there is a further stimulus to all consumers to use a larger amount of gas instead of coal.

Q. Is that all you have to say on that subject, Professor?

A. I think it is, on that subject.

Q. Now, in Table 17 I notice you gave some facts about the return on capital and then others upon renewals, depreciation and contingent fund. Have you anything further to say on those matters?

A. Only a sentence or two. There seems to have been accumulated $2,000,000 due to the company from consumers which they might treat in the nature of a surplus.

Q. You mean the company?

A. The company. As against contingencies. This $2,000,000 is testified to in one of the company's exhibits, and I quoted it this morn-

ing. That is an accumulation which they did not testify to in 1884, and therefore it is the product entirely of the last twenty years; further, I would state, that if we ignore, which I do not do, Mr. Yalden's computations, and start with Mr. Rowland's and the consolidation of 1884, then $41,500,454.99 is the largest amount of capitalization that can be estimated on the basis of the increase of construction account since 1884, plus the $616,470.08 of supplies and plus one million dollars for working capital. And as to any further increase in the present value of the plant that can be shown by an inventory in excess of that amount, it has to be divided into two classes: The first class is appreciation in property, either paving or growth of land values, which I do not think can be made a basis for charging for gas, but the other point in which there might be an increase is through their having brought into the plant since 1884 more money than is reported under the head of new construction, namely,
3096 $9,693,565.90. To the extent to which the inventory made showed that more money has gone into the plant than that and now represented by structural value, then to that extent must we deduct from the amount of repairs and renewals during the last twenty years which have not reached 10.89 cents paid for the last eleven years. That will average about nine and one-half cents, I believe. Now, the extent to which the capital account would be increased in that way would be more than counterbalanced by a greater reduction in repair and renewal account so that the maximum that I am able to estimate even on the basis of the $41,500,454.99 as capitalization, which is more than I admit, but taking that, which is $3.71 per thousand feet of sales, six per cent. on that will leave, as stated this morning, 76.72 per thousand feet, and eight per cent. will leave 83.62 cents; but I have already testified——

By Mr. Mathewson:

Q. Added to what figure?

A. That is where the six per cent. and eight per cent. originally were added to the 57.92 cents operating cost, that operating cost being the cost claimed by the Company after reducing their repair account to 10.89, and after excluding lamp account, miscellaneous income and making a slight correction, in taxes but leaving their station costs and general operating costs, distribution charges. But that makes no allowance again for the result of reducing prices on consumption which I have just been testifying about. I think that is all.

By Mr. Burr:

Q. And the maximum figure that you are able to estimate as the cost per thousand cubic feet at the consumers' meter is what?

3097 A. The maximum on the six per cent. basis is 76.72. While with that same six per cent., taking my estimate of what the cost of operation ought to be by revising station cost and general distribution cost, 67.43; both of those being on a six-per-cent. basis.

By Mr. **Mathewson**:

Q. What is that figure 48.63?

A. That was operating cost that I testified about yesterday, and was based upon reducing the station cost reported by them to what the other companies in New York City are doing and applying the cost also of oil prices prevalent in Boston and Lynn. And as to the distribution, reducing their distribution cost from 9.45 cents to 7 cents, which is still higher than the accountants found was the case in Chicago where it was less than 6——

By Mr. **Mathewson**:

Q. Do you mean distribution?

A. I mean distribution and generally what was technically termed in my table "Other Expenses."

Q. Oh, yes.

A. And which covered practically distribution and general expenses, aside from taxes and repairs and depreciation.

By Mr. **Burr**:

Q. Now, the result of the examination of the books of the Company and the examination of the plant that engineers are to make may give you further light on the subject?

A. Certainly.

Mr. **Burr**: And so, with that reservation, and the coming in of the reports of the accountants and the engineers, that is all that I have to present through Professor Bemis at the present time.

3098 Mr. **Mathewson**: Has the Professor concluded his testimony? Do you so understand?

Mr. **Burr**: With the exception that the figures, and the facts that may be gleaned from the examinations that I have spoken of.

The **Master**: He does not say he will, but he says he may, as I understand it.

Mr. **Burr**: Yes. Of course we do not know what the results are or may be.

Mr. **Mathewson**: The Professor is not testifying on the subject of the valuation of plants, is he?

Mr. **Burr**: Not as I understand it.

Mr. **Mathewson**: He is not one of the experts for that purpose, is he?

Mr. **Burr**: I have not called him for that purpose and he will not be called for such purpose.

Cross-examination by Mr. **Mathewson**:

Q. Professor, you say you never have operated a gas plant, or built a gas plant?

A. No, I have not.

Q. And you never have been in the gas business?

A. No.

Q. But you are superintendent of the Cleveland Water Works Company?

A. Water Works, yes. It is a city-owned plant.

Q. That is a municipal concern?

A. Yes.

Q. What is your position in that plant?

A. Superintendent.

Q. What is your duties as superintendent?

A. The general management of the plant in all respects, both the pumping stations and the distribution.

Q. Do you have any charge of the purchase of pipes for the distributing system?

A. Yes.

Q. Directly or through your subordinates?

3099 A. We have a system of advertising for bids and then I report upon which bid seems to me the best and then it is accepted by the Board of Public Works, which finally makes the award.

Q. You say you testified in Boston in 1905, or was it late in 1904?

A. Well, it was the Winter of 1904-5. My testimony began. I think, in December, 1904.

Q. By whom were you retained in that matter?

A. Jointly by the city and by Mr. Auerbach, the attorney for the Boston *American*.

Q. The Boston *American* is the Boston paper of Mr. William R. Hearst, isn't it?

A. That's right.

Q. And Mr. Auerbach represented that interest, didn't he, in that investigation?

A. Yes.

Q. You also testified before the New York Gas Commission in 1905 and 1906?

A. Yes.

Q. And by whom were you retained here?

A. By Mr. Shearn, Clarence J. Shearn.

Q. And Mr. Shearn is the counsel for Mr. William R. Hearst here, isn't he?

A. I understand so.

Q. And you understand you were retained by that interest here?

A. Yes, at that time, not in this case.

Q. And compensated by them?

A. Yes.

Q. You did not receive any compensation from any other source except that source in New York, did you?

A. No. I did in Boston, as I said. Half of it was by the city.

Mr. Burr: You are referring solely to his testimony before the Gas Commission?

Mr. Mathewson: Yes, certainly.

Q. And being so retained you testified really in Boston and in New York in behalf of the Municipal Ownership League which was being advocated by this gentleman, didn't you?

A. I really don't know what you refer to by my testifying in Boston or here in behalf of the Municipal Ownership League. These two cases are those what you mean?

3100 Q. Yes, before the two commissions?

A. That testimony had no relation to any Municipal Ownership movement, so far as I am aware.

Q. Was not the newspaper that employed you instrumental in pushing and advocating the Municipal Ownership League at that time?

A. I have read in the papers that such was the case, but that had nothing to do with my work.

Q. No, you didn't know anything about that? That is a subsequent development, I suppose?

A. I knew nothing of the League at the time I was in those cases.

Q. Have you testified within the last fey years in favor of any Company or in favor of maintaining the price of gas, that you remember?

A. My work has always been for the cities.

Q. And in favor of the reduction of the price of gas?

A. Where it seemed to be justified.

Q. Can you remember any case where you have testified that you have not testified that you believed a reduction was justified?

A. No.

Q. You have been advocating and still are an advocate of Municipal Ownership, are you?

A. In a general way and under general conditions. There are exceptions.

Q. Generally speaking, the municipal ownership of public utilities?

A. Yes.

Q. Including gas companies?

A. Yes.

Q. In making certain computations as to the cost of gas in the City of New York or the operating charges against gas, you have eliminated fixed charges. You found, did you not, that Mr. Addicks and Dr. Humphreys in their computation of the operating cost of gas made a similar deduction?

A. Yes.

Q. So there is no difference between you there?

A. No.

Q. You did deduct for the year 1905 (Exhibit 94) interest on consumers' deposits .39 of a cent? 3101

A. Yes.

Q. Neither Mr. Addicks nor Dr. Humphreys did make that deduction, so that would be a difference of .39 cents between you and them, wouldn't it?

A. Yes.

Q. And you have stated in connection with the suggestion that gas could be manufactured cheaper in New York by the Consolidated than its exhibits show, that if it is not manufactured cheaper than these exhibits show it is due in your judgment to extravagance or to badly situated plants cut off by city streets. I understood you to say that you were not prepared to charge extravagance.

A. No, I didn't claim that. I did say a third reason. You mentioned two.

Q. What is that?

A. Bad oil contracts.

Q. Oh, yes, but except for the bad oil contracts, assuming them to be bad, there is no claim on your part of extravagance?

A. No.

The MASTER: Didn't he say something besides extravagance? Didn't he say incompetent management or inefficient management?

Mr. MATHEWSON: No, I don't think so.

Mr. BURR: Inferior plants.

The WITNESS: I would say I didn't claim to know positively what the causes were.

The MASTER: Badly managed, I think he said, something of that kind.

The WITNESS: I said in an up-to-date, efficiently managed plant, the cost of it would be less.

By Mr. MATHEWSON:

Q. Well, eliminate for the moment, the oil contract which
3102 you have critizised. Are you able to state any other direction
or item in which you are able to say the Company has been extravagant or has been incompetently managed?

A. I said labor cost was high, and I said, that as compared with the Central Union, the receipts from residuals were low.

Q. Well, we will take those. Then we have got the oil contracts, labor cost and receipts from residuals.

A. I think I criticized the cost of cartage and labor handling

Q. Then, you do think that the company was extravagantly or incompetently managed in connection with the oil contract, the general cost of labor, the receipts from residuals, the cartage and labor of handling, do you?

A. Either poorly managed, or a poor plant, or poorly situated plant.

Q. Well, which one?

A. I do not undertake to say.

Q. If there is any item of labor, which appears in these exhibits, general labor, exclusive of cartage and labor of handling, which you can point out as extravagant or improper, I will ask you to do so now?

A. I cannot do so until I have the report of the accountants.

Q. You cannot do so from any material now before you?

A. No.

Q. Now, as to labor of handling and cartage, you said that the plants of the company had been cut off by streets in some instance laid out by the city between the plants and the river?

A. Such has been the testimony.

Q. That being so, that would not mean incompetence or extravagance if the expense of cartage and labor of handling had shown an increase, would it?

A. That would relate to the station.

Q. And that would not indicate extravagance or incompetence in the handling of the company?

A. No.

3103 Q. Now, as to receipts from the residuals. Have you any grounds for suggesting that the receipts from residuals indicate extravagance or incompetency except for the reason that you say they are less than the receipts of the Central Union plant?

A. That was my reason.

Q. Have you any other that you can assign?

A. No. There was testimony in this case by George E. Wood, which I quoted.

Q. Yes, we will come to that latter. But I don't think that necessarily indicates incompetency of management. Didn't that have reference to the character of the plant at the Central Union?

A. More or less.

Q. Now, as a matter of fact, if you read the testimony as I understand you to say you did, before the Gas Commission, do you not recall the fact that the Central Union Company manufactures a much greater amount proportionately of coal gas than the Consolidated?

A. Yes, but I only compared the coal gas plants of the Consolidated with the Central Union.

Q. And to get the amount which was obtained for residuals by the Central Union did you take the gas that was produced by the coal gas part of the Central Union, or did you take all the gas which was sold by the Central Union and divide the receipts for residuals by the total output of the Central Union Company?

A. I took the receipts from residuals of the Central Union Company and divided them by the gas made at the coal gas plants, which was 925,000,000 feet. In other words, I took the exhibit which was put in evidence.

Q. You understand that no part of that 925,000,000 feet which was produced at the coal gas plants was sent out to consumers in that shape, do you not?

3104 A. When I say 925,000,000 I may have been mixed about that with water gas one was 925,000,000 and the other was a little less. Which ever it was I took only the coal gas. The exhibit and the evidence will show what it was, and how many feet there were.

Q. Don't you recall in evidence the statement that the conditions for the sale of coke at the Central Union plant were very much more favorable than the conditions for the sale of coke by the Consolidated plant in Manhattan?

A. Yes, and I made a remark on that. It made a difference of one cent only out of eleven cents.

Q. How did you make the estimate?

A. In the testimony I introduced a table showing how much more the two coal gas plants of the Consolidated would have obtained per thousand feet if they had obtained the same price for coke which was obtained by the Central Union, which was $3.23 per ton, I think, instead of about $2.90 in the case of the Consolidated plant, and $3.09, or something like that, in the case of the other.

Q. How about the tar and ammonia?

A. The Central Union exhibit did not detail at all those items and so I stated in the evidence that I had not sufficient evidence to go on and itemize the difference in residuals.

Q. You did not take into consideration the water gas tar, did you?

A. You mean the Central Union?

Q. Yes.

A. No, I had no data I said for itemizing the residuals because the exhibits and all there was of evidence in the case did not itemize. But coal gas and tar would have been made also by the coal gas plants of the Consolidated.

Q. I am speaking about water gas tar, Professor?

A. The exhibits separated coal gas residuals in the Central Union from water gas residuals, and I had the total residuals of the coal gas plant. All I mean to say is I did not have any way of
3105 separating the receipts from coke and the amount of coke from tar and ammonia. That is all I meant to say.

Q. Did you not read in the testimony that the Central Union Company was able to sell large quantities of its coke to the New York Central & Hudson River Railroad Company, which was delivered on the cars of the company, which were run into the station yard for that purpose, so that there was no expense in storage or handling or the breakage which is incident to the rehandling of coke?

A. I don't remember fully. I do remember that there was testimony of their selling to that railroad, but I took account of the fact that the delivery of coke by the Consolidated is done for it, and the expenses of the delivery are taken care of by the National Coke & Coal Co.

Q. Didn't you say you didn't know whether that was so or not as to the Consolidated?

A. No, I did know that. I did know that the delivery of coke by the Consolidated to private consumers through the city was done by the National Coke & Coal Company, according to the evidence which I have read in the case, as I understood the evidence; but what I did say was I did not know as to the Central Union, just how they managed their coke question.

Q. If it be true in the testimony as you have read, that a large part of the coke of the Central Union is sold to the railway company, that it is separated right there, and that it takes the coke immediately without storage or handling, that naturally would give a higher price to the Central Union for coke, would it not, than the Consolidated which has to re-handle it, or some of it, or deliver it?

A. But the difference is only one cent. I brought that out in the evidence.

Q. I am not dealing with the degree of difference, but that would make a natural and proper difference in the price received for that residual?

3106 A. So far as the expense is greater, but you cannot say that the entire delivery of coke is by the Consolidated, because as I have read the evidence, the National Coke & Coal Company does the delivery of coke. They get it, as I understand it, they shovel it into their carts, at the Consolidated works, and I don't understand that the Consolidated has to bear that expense.

Q. But, as a matter of fact, you have read also that the National Coke & Coal Company is a corporation, all of whose stock is owned by the Consolidated and that it is in reality the cartage department of the Consolidated?

A. Certainly.

Q. So that it would not make very much difference whether you said it was sold by the National Coke & Coal Company or sold by the Consolidated directly?

A. Oh, yes, it would in the matter of this evidence, because the price obtained for coke by the Consolidated would be much higher nominally if it was delivering to consumers than it is when it is delivering wholesale to a company that gets it at the yard. While——

Q. Yes, but if the Consolidated received from the National Coke & Coal Company a price for this coke and the National Coke & Coal Company sells it and the amount of net earnings of the National Coke & Coal Company for the year are only $5,000 or $10,000 or $15,000, that would not make a very material difference, would it, in the price which the Consolidated received from the coke, which ever way you considered it?

A. Certainly it would make a difference in the gross price because the difference between what the National Coke & Coal Company charges the consumer and what the Consolidated charges the National Coke & Coal Company must be considerable, it must cover all those expenses of delivery.

3107 Q. Yes, but when you are computing the price at which coke is sold, do you take in the case of the Central Union and in the case of the Consolidated the price which is received from the purchaser of the coke less the expenses of delivering it, or do you take simply gross the amount which is received from the purchaser?

A. In the case of each company I took what I understood to be the price at the yard. In the case of the Central Union, for example, I had only this to go upon, the price at which coke was valued or what was used in making water gas, which was doubtless the coke made in the coal gas plant, and I was able to compute the price of that per ton and that was coke delivered in the yard, you might say. Then when it came to the two Consolidated plants there was in what is known as Exhibit 145 before the State Gas Commission, brought into this case as City's Exhibit 56, and that was the price of the coke of the Consolidated Gas Company of coal gas stations, and that was a price also at the yards, only in this case instead of being delivered on cars as you say it was of the Hudson River Railroad it was delivered to the carts of the National Coke & Coal Company. In either case the delivery was done by other parties.

Q. And when you assume a price of coke you take then, therefore, the price which is paid by the consumer for coke delivered at the yard and you do not deduct therefrom any expenses of cartage or delivery on the part of the seller, do you?

A. In either case I do not.

Q. Then it would make no difference, would it, whether the expenses of the delivery of this coal and coke were paid directly by the Consolidated or whether they were paid by the National Coke & Coal Company and thereby the profit which the National Coke & Coal Company would return to the Consolidated Company were reduced; it would make no practical difference in the result, would it?

3108 A. No, I think not, as I see it now. I think it will make no difference. No difference in the net result.

Q. Nor in what you would call the price received for the coke?

A. There would be a little profit there of the National Coke & Coal, so far as there is a profit.

Q. Slight. Now let me see what figure you take for the coke of the Consolidated Gas Company. Do you take the figure at which the Consolidated Gas Company delivered its coke to the National Coke & Coal Company at the Consolidated yards?

A. I understood that to be what I was doing. I understood that to be the character of the exhibit.

Q. Well, the exhibit, or rather the testimony showed the price at which the coke was sold delivered at the yard to the consumer at wholesale, the price at which coke was sold delivered to the consumer at retail, in the yard, and the price which was received delivering coke by wholesale to the consumer, and the price which was received delivering the coke retail to the consumer outside. Now, which one of those four did you take?

A. I understand I took what appears in City's Exhibit 56, which was the report of the Company as to the price the Consolidated got for the coke; not the price which the National Coke & Coal Company got for the coke.

At 4 P. M. adjourned to October 18, 1906, at 11 o'clock A. M.

Last Exhibits:

Complainant's, 256,
State's, W,
City's, 59.

3109 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, THURSDAY, *October* 18, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Kirby, Mr. Burr.

3110 **EDWARD W. BEMIS** resumes the stand.

Mr. BURR: Professor Bemis wishes to call attention to some errors in the testimony of October 16, and inasmuch as they concern certain figures, it is better to have them corrected now, so that the cross-examination may be based upon the correct figures.

The WITNESS: I only refer to typographical errors. I have not had time to read over the printed testimony, taking it for granted that it was probably correct; but in a glance this morning at a small portion of it, I find on page 2966, at the bottom of the page, that the cost of cartage and labor handling is put down as $1.29 per thousand feet, when it should have been 1.29 cents. In other words, the dollar mark should not have been there. The same applies to the footing of the last column, which in the printed page is $1.24, but should be 1.24 cents, the dollar mark to be omitted.

On page 2937, about the middle of the page, occurs this question:
"Q. You say that is shown by an expenditure of $132,677.10, as "shown in Exhibit 94, or 24 cents per thousand feet of gas made?
"A. Yes."

That should have been not 24 cents, but 1.24, as is also indicated in the figures in the previous table.

Now, having mentioned these two, and I may say there was a place somewhere where I noticed my name was put down as William G. Bemis, that makes me believe that I may find in reading it over to-night other errors which I will have to call attention to to-morrow, but I have not read it through yet to find any others.

3111 Cross-examination continued by Mr. MATHEWSON:

Q. You were referring at the adjournment yesterday to certain comparisons that you drew between costs of manufacture, as you computed them for the Consolidated Gas Company on one hand and the Central Union Company on the other, and you said that you understood that the price for coke which you had assumed was the price specified in City's Exhibit 56, which was Exhibit 145 before the Gas Commission?

A. Yes.

Q. You know, don't you, whether you took the figures from that Exhibit or not?

A. Yes, I testified that I used the figures of coke employed in making the water gas and computed from that the unit price of coke per ton for the Central Union (bottom of page 2985 and top of page 2986).

Q. You took the price of coke received by the Central Union Gas Company as $3.23 per ton, did you?

A. Yes.

Q. And that was the price at which you say coke was delivered from the coal gas plant of the Central Union to the water gas plant of the Central Union, according to the exhibits in the Central Union case before the Gas Commission?

A. Yes.

Q. Will you point out in the Central Union Exhibit, how you procured that $3.23?

A. In the Central Union Exhibit, which was a tabulation of coal gas and water gas separately—I am looking for my copy of the water gas. It was not put in evidence, the water gas part of the exhibit, but as I copied it from the typewritten exhibit, the statement is made, "coke used 23,155,050 pounds;" then to the right is "$37,381.56," which is also what I think I stated in the testimony. Yes.

Q. In other words, you took the amount of coke used by the
Central Union Gas Company in its water gas plant and
3112 divided that into the figures $37,381.56, at which it was carried in the water gas manufacturing statement?

A. Yes.

Q. And the quotient was $3.23?

A. After reducing it to tons.

Q. You understand, do you not, that the Central Union water gas plant receives all its coke from the coal gas plant of the Central Union?

A. I suppose it does.

Q. You haven't any figures as to what the Central Union paid, if it paid aything, in the open market for coke, have you?

A. No.

Q. You haven't any figures as to what the Central Union sold a ton of coke for, have you?

A. No.

Q. And so long as the Central Union sends its mixed coal and water gas out together—as you understand it does, do you not, Professor?

A. Yes.

Q. It sends no water gas or coal gas separately into its mains, but mixes the two and sends that out?

A. That is as I understand it.

Q. The gas that reaches the consumer is a mixed coal and water gas?

A. Yes.

Q. So that it is not of the slightest importance, so far as the cost of this mingled gas is concerned, whether the coal gas plant in turning its coke over to the water gas plant credits that coal to itself at $3.23 a ton or $5.00 a ton, provided it charges the water gas plant at the same figure?

A. I was under the strong impression that in corresponding exhibits of the Consolidated Gas Company the value or price put upon the coke used in its water gas plant was the price at which it was selling the coke to the National Coke & Coal Company.

Q. Well, if you recall the testimony, you will find that Senator Page in his questions raised the question as to whether that was so, don't you remember that?

A. I don't recall it.

Q. And there was quite a long examination of Mr. Carter 3113 on that subject?

A. I don't recall it at the moment.

Q. But, as a matter of fact, it would not make any difference at what price the coke was charged to the water gas plant of the Central Union and credited to the coal gas plant of the Central Union, provided it was charged and credited at the same figure, would it?

A. No.

Q. In the final cost of the gas?

A. Certainly, it is usual to charge——

Q. Therefore, it is not a matter of great importance in determining the cost of the entire volume of gas that the charge of coke to the water gas plant and the credit to the coal gas plant should be an exact market figure, or exactly follow the market, is it?

A. No, but in the absence of testimony to the contrary, it was proper to assume the usual practice.

Q. That is a question, but as a matter of fact, you did assume——

A. The usual practice.

Mr. Mathewson: I move to strike that out. You have never been in the gas business, I understand. I do not know that is the usual practice, Professor.

The Witness: Well, I meant that was what I had observed in a great many cities in reports to the Massachusetts Gas Commission.

Q. But simmered down, it is this, that you took the figure at which it is charged to the water gas plant and credited to the coal gas plant of the company itself, and not any figure at which the company sold any coke in the market to the New York Central Railroad, or anybody else?

A. I think I so stated in my evidence.

Q. Now, about the Consolidated Gas Company, you say 3114 that in dealing with the cost of coal gas at the 14th Street and 42d Street stations, and in determining the price received for coke as a residual you took the figure which appeared in City's Exhibit 56 at this hearing?

A. Yes. Well, City's Exhibit 56 for the Consolidated, that was not any City's Exhibit. Oh, yes, that is right.

Q. Was that figure a figure at which the Consolidated was selling its coke in the open market, or was it a figure at which it charged the water gas plants and credited the coal gas plants?

A. I will perhaps answer that better by looking a moment. In that exhibit the total coke sold in the market, which was 114,776.99 tons, was $2.99.

Q. Are you taking now the 14th Street?

A. I am taking all the stations, "Summary of Operations," which is the page preceding the 14th Street, and represents the annual cash receipts from coke, and I find that the total coke sold by the entire Consolidated Gas Company is credited as worth to-day, and as bringing in to-day, as I just stated, $2.99 a ton. I discover on the next page of the exhibit that the 14th Street station credited its coke as bringing in $3.08, and the 42d Street station as bringing in $2.90, and I find that the average of the two is exactly $2.99.

Q. When you say that the 14th Street plant credits itself with bringing in a certain sum for its coke and the 42d Street does likewise, from what sources do you understand these sums were brought in?

A. In the sense you intended it is brought in by Mr. Carter, to my kno*lw*edge.

Q. No, let us have an answer. I want to know what your understanding is?

A. I understand that in the exhibit showing the total cost of gas, operating expenses of gas, the Consolidated Gas Company tells the Court that from the total gross cost of coal must be deducted receipts from residuals, and it gives those receipts; and the receipts for
3115 coke were $2.99 a ton, and amounted for the entire company
to $343,526.94, less labor of handling; being for the period ending October 31st, 1905.

Q. You understand, then, that that is received from sales of coke in the open market, and not merely transferred from a coal gas station to a water gas station of the Consolidated, do you?

A. I understand it is a transfer from the Consolidated to the National Coke & Coal Company.

Q. Well, very good; not a transfer from a coal gas plant to a water gas plant?

A. That is true.

Q. In other words, you do not understand that the number of tons you have specified as selling for $343,526.94 includes all the coke produced by the company, do you, but only that which it did not use and sold?

A. In the case of the Central Union?

Q. No, in the case of the Consolidated Gas Company?

A. It is the value placed upon the coke used—I was not paying the closest attention to that question.

Q. Well, I will repeat it. (Question repeated.)

A. I so understand it. I understand, however, that it does include the coke transferred from the coal gas to the water gas plants of the same company, so that it includes more than is sold to private consumers.

Q. Now, is there anything there which tells you, or have you any data from which you can tell what the Consolidated Gas Company received in the open market or from the National Coke & Coal Company, if you put it that way, for its coke, and how that compared with the price which it charged water gas plants for coke transferred from coal gas plants to water gas plants?

A. In an exhibit of the National Coke & Coal Company, which I have not in mind very fully, there is a statement of, I think, the total and entire coke business which the National Coke & 3116 Coal Company receives, and then carts and sells, but I did not make a study of that transaction of the National Coke & Coal Company. I can easily do it.

Q. The question is whether you find that the price at which the company's coke was sold in the open market corresponds precisely with the arbitrary price which was credited to coal gas plants and charged to water gas plants where it was transferred from one to the other?

A. I have not examined to know.

Q. Then you are not able to say whether in the case of the Consolidated Gas Company this rule that you have sometimes found observed as to following the market price in transfers of coke between plants was here followed?

A. No, I cannot. But I found that the 21st Street station in its water gas plant charged itself with an expense for coke at $3.24 a ton; the 44th Street station at $3.35, and the 99th Street station at $1.45 a ton.

Q. And you find that no one of those figures agrees precisely with the average figure at which the company disposed of its coke, do you?

A. I have not averaged it to see.

Q. Well, is it not pretty obvious that it would not come out exact?

A. There was very little coke used, I see, at the 99th Street station, only 568 tons, and at the 21st Street station 16,308 tons, and at the 44th Street Station 5,858 tons. I would no- be surprised by a cursory glance, and which I will take longer to verify if you wish, that the cost, adding all these tons and dividing into these prices, would be about the same. I don't think there would be very much difference. If you wish, I will verify it.

Q. No, it is not worth while to take the time now.

A. It looks to my eye to be about the same.

Q. Do you think it is a safe thing to make comparisons the way you have done as to prices received for coke and criticise a 3117 company because it has not received as much for coke as you think some other company does, and take for the purposes of comparison only the prices at which the company transfers its coke from coal to water gas plants, without investigating what it actually received in the market for that which it sells?

A. But while I think it was not a complete and full study, as I stated in my evidence, for lack of further data, yet it was only involving one cent out of eleven cents of cost, and I presented it as the best I could get on the subject. I will make a further study of the coke question, if it will please you, as to the exhibit, as to the sale in the open market of the National Coke & Coal Company.

Q. So, too, as to the Consolidated Gas Company, so far as concerns its gas; you know it is sent into the same mains and there mingled, before it reaches the consumer?

A. Yes, sir.

Q. And so far as the Consolidated Gas as a whole is concerned, it makes no difference at what price it credits its coal gas plant with coke transferred to water gas plant and charges the water gas plant correspondingly, provided it uses the same figures.

A. In making the exhibit to the Gas Commission——

Q. I am just asking you whether that is not the fact?

A. I would not consider that is a fair exhibit, or that which it purports to be, if it was not giving a market valuation on that coke.

Q. That is not the question, at all. So far as the cost of the Consolidated Gas as a whole is concerned, it makes no difference at what price it credits its coal gas plant with coke transferred to water gas plant and charges the water gas plant correspondingly, provided it uses the same figures?

A. Repeat that again, please.

Q. (Question read.)

A. That is correct, but it makes a great difference in the fairness of the exhibit.

3118 Q. We may not be so artistic, but we are trying to get at the substance. Having made these assumptions as to coke, and the prices received, you presented a table which we have called 8, page 2983-4, and in that connection you say you deduct for oil and repairs—in comparing the Central Union coal gas production with the production of the Consolidated Gas Company's coal gas production at 14th Street and 42d Street?

A. Yes.

Q. Why did I understand you deducted the oil?

A. Because there was a good deal more oil used by the 14th and 42d Street stations, in order, as the testimony has it, to secure a higher candle-power than the Central Union was giving.

Q. Yes?

A. And especially as the Central Union was giving in its coal gas plant, therefore I eliminated the oil to find what the cost was without regard to that element of extra or high illumination. In other words, to bring it down to a coal gas of perhaps 12 or 13 candle-power.

Q. And why did you deduct the item of repairs, which seems to be higher for the Central Union than for the 14th and 42d Street plants?

A. Repairs are somewhat fluctuating in any company from year to year, in a coal gas plant more particularly. Some years they do more of the renewal of retorts than they do other years, and I was endeavoring to find costs, aside from these items.

Q. You will have to assume something for those items of repairs, if you were to make a fair comparison, would you not? Would it not be fair to assume the same cost per thousand cubic feet for each plant on the average?

A. I do that by assuming no cost.

Q. You think it would not be fair to take the cost of repairs as they stand here, where the Central Union is higher than the Consolidated Gas Company?

3119 A. Not without further information. It may be that the Central Union is spending too much on repairs, or the others too little.

Q. Well, you say that the great difference in the cost of coal gas at the Central Union and at the Consolidated Gas Company's coal gas plants consists in the amount received for residuals, and, secondly, in the labor cost?

A. Yes.

Q. As to the amount received for residuals we have dealt with that subject?

A. Only with coke.

Q. Is there anything else that you desire to say on the subject of residuals?

A. I remarked that the Central Union did not itemize its residuals, so it is impossible to go into it.

Q. You cannot tell how much is received, then, for each one of the various products aside from coke?

A. And I cannot tell what it received from coke as a whole.

Q. Taking the subject of labor, the Central Union, as you say, shows 5.89 for labor, while the 42d Street station shows 11.52 cents, and the 14th Street 7.65 cents. Do you know that the Central Union plant consists of a coal gas plant and a water gas plant under almost the same roof, that is, directly adjacent?

A. I don't know how they are related to each other. I have never visited them. But I know there are two plants that make gas together there, one a coal gas and the other a water gas plant, for the exhibit shows it.

Q. You know they are directly together, don't you?

A. I understand so.

Q. Located adjacent?

A. I understand so.

Q. The same is not true of the 14th Street plant of the Consolidated Gas Company and the 21st Street plant from which it receives its enrichment in oil gas, is it?

A. No, but either the 14th or 42d Street makes as much gas as the Central Union output, both coal and water.

3120 Q. That may be, that is another proposition. Where a plant like the Central Union has a water gas and coal gas plant situated immediately together, would not the cost of labor naturally be less?

A. The coal gas labor?

Q. Yes.

A. I cannot see why it should. I cannot see, unless you assume they have taken some labor that belongs in coal gas and put it in the water gas in their exhibit.

Q. No, might there not be labor applying to both which might be divided in some proportion?

A. Not any more than where there is a plant making twice as much gas as the Central Union, there might be economy, but the Central Union had no larger output than the 42d and 14th Streets.

Q. After a plant has an output of something like 700,000,000 feet, there is no further economy so far as cost of production is concerned?

A. Some claim there is and others claim there is not?

Q. What was your opinion as expressed before the Gas Commission?

A. I think the economies are very slight in the larger output above the $700,000,000 feet, but I am not prepared to say that there are none.

Q. You said before the Gas Commission that you thought there would be substantial economies above that figure.

A. I stated that perhaps it was so, but at another hearing I stated that at Astoria, owing to the great size of the output, there would be economies they could not get from the smaller plants.

By Mr. **Burr**:

Q. That was the testimony of Mr. Bradley also, was it not?

A. I understand so.

Mr. **Mathewson**: I move to strike that out. I don't think that was the testimony of Mr. Bradley, stated broadly.

3121 The **Witness**: I remember distinctly my own testimony, that I did later say something about the economies of the enormous output at Astoria.

By Mr. **Mathewson**:

Q. Did you not testify in the Boston investigation in 1904-5 that after you had reached an output of about 700,000,000 feet, there was no substantial economy by reason of any increase in production beyond that?

A. I don't remember definitely, but it is quite possible. The economies do come chiefly in distribution after that point is reached.

Q. Now, as to this cost which you have referred to as 19.64 cents of coal gas at the Central Union plant, you have referred to some testimony of Mr. George E. Wood?

A. Yes.

Q. You say that he referred to the cheaper price at the Central Union Company as attributable to the Central Union plants as compared with the Consolidated Gas Company plants, for one thing.

A. That was one thing.

Q. Was not his statement in that regard that the two plants were modern plants and located directly together, which made an economy in operation?

A. I don't remember at the moment. It was read yesterday or the day before in the evidence.

Q. Perhaps it may not all have been read. Don't you remember that that is substantially what he said?

A. I don't recall it now.

Q. He said that they received a higher price for coke, you recollect that, and a better market, you recollect that?

A. Yes.

Q. Don't you remember that testimony was given as to the candle power of the Central Union generally?

A. Yes.

Q. Now, Mr. Wood's testimony was as to the cost of the Central Union gas, taken as a whole, wasn't it?

A. Yes.

3122 Q. Do you remember that Mr. Wood gave any testimony as to the reason, if there be one, why the coal gas at the Central Union cost less than the Consolidated?

A. Yes, he did testify on that point.

Q. On the coal gas?

A. Yes, because he referred to the inclined benches of the Central Union as superior to the small benches, which took more coke and had other disadvantages, at the 14th and 42d Street plants, so that was entirely coal gas.

Q. Yes, but was not he dealing entirely with the cost at which the Central Union mixed coal and water gas was produced?

A. Yes.

Q. And were not the questions directed to that?

A. Yes, but in so doing he took up as the evidence of inferiority the coal gas plants.

Q. Well, inferentially, he mentioned certain of the apparatus.

A. Directly.

Q. Well, directly he mentioned certain of the apparatus employed in the manufacture of coal gas?

A. Yes.

Q. But he did not deal with the difference in cost of coal and water gas at that time specifically?

A. His criticisms were all directed to the coal gas features of the Consolidated.

Q. Did he deal with the cost of the coal gas and the water gas separately in his testmony of the Central Union Company?

A. Perhaps not in so many words, but he commented on the coal gas portion of the Central Union as compared with the coal gas portion of the Consolidated.

Q. Did he give any figures of the coal gas as distinguished from the water gas of the Central Union and compare those two?

A. No, he testified that Mr. Carter had the figures.

Q. Do you know what candle-power this coal gas was which was produced, as it appears, at a cost of 19.64?

A. I believe the testimony was not very clear on the coal gas as distinguished from the water gas, but there was testimony on 3123 the gas after it was mixed, and it was said that through lack of a proper inspection in The Bronx the company had not been living quite up to the law, they thought.

Q. We will get to that in a moment, but I am speaking of the coal gas, which stands at 19.64 cents, according to what you have indicated.

A. I believe there was some statement that it was practically a coal gas, with only this slight mixture of oil, and therefore I know it could not have been much above 14 or 15 candles.

Q. I call your attention to the testimony in that case where this reply is given, "The candle-power is not uniform; one month it is 14.27 and the next month it is 13.83, and so on."

Mr. **Burr**: Whose testimony is that which you are reading from?
Mr. **Mathewson**: The testimony in the Central Union case of Mr. George W. Doane.
The **Witness**: He gives other statements where it runs up to 15.

Q. One month 15.68, month of May, 14.44, April 13.82, March 13.84, February 13.83, January 14.37. And Mr. Doane continued: "I should say I was giving you a fair estimate if I said it was from 14 to 14½ candles."
A. Yes, I remember it now.
Q. So that that coal gas which was unenriched——
A. It was a little.
Q. And costing 19.64——
A. It was enriched by a little oil.
Q. Yes, a little oil, oil to the extent of 1.27 cents?
A. That is right.
Q. Whereas the testimony you found to be that it cost to enrich at the 14th Street coal gas station by oil in order to bring it up to candle power something like ten cents, wasn't it?
A. The oil cost at 14th Street nine cents and at 42d Street——
Q. How much more than nine cents?
3124 A. It was nine cents.
Q. Wasn't it higher?
A. No, the exhibit on page 2984 shows nine cents.
Q. Exactly nine cents?
A. Yes.
Q. Gas made or sold?
A. Gas made.
Q. And this is only 1.27?
A. Well, it was 6.54 cents at 42d Street and 9 cents at 14th Street, and I eliminated those items.
Q. Yes, but I am calling attention to the fact that this was gas practically unenriched or enriched to a very small extent and far below any candle power in which it could be sent out to the consumers?
A. Yes.
Q. Have you taken pains to ascertain what the cost to the Central Union Company was of the gas which it actually sent out to consumers, I mean the cost of production of the mixed gas which was sent out to consumers for the year ending October 31st, 1905?
A. I have not it in mind at the present time. I went over it once I think, but some time ago, and I do not recall it now.
Q. Suppose you take the same exhibit as the one from which you have been testifying—perhaps I can show it to you here. I think it is the same thing, and I ask you if it does not appear from that that the cost of the water gas manufactured as distinguished from the coal gas was 32.79 cents?
A. Yes, I will give you a total of the mixture if you wish.

Q. I have it right here, I think. And it also appears——

A. I have a copy of that here before me.

Q. And it also appears by this exhibit which you have used in your computations that the cost of the entire gas, or mingled gas, per thousand feet sold was 28.94 cents or in round figures 29 cents for that year, doesn't it?

A. Just a moment.

Q. (Handing paper.) Here is what you referred to.

3125 A. I was talking all the time about gas made, and that exhibit shows—let me examine it a minute.

Q. Yes. Take it either way or both.

A. My figures were different from those, and so I am waiting to verify them. This exhibit which I think I have never seen before, this combination gives the total cost as $424,343.02, to which should be added, not any losses on gas sold to the Consolidated Company under the agency agreement, but there should be added only expense at works, $6,403.19, and distribution at works, $4,573.76, making $435,319.97. Now, that divided by the total gas made, both coal and water gas, which was 1,596,410,000 feet, gives 27.27 cents, which should be compared with City's Exhibit 56 which——

Q. I have not got to that point. Let me ask the questions and you later will have an opportunity if there is anything you want to explain. I am simply trying to get at certain facts now.

A. Well, per thousand feet of gas made——

Q. Now you said something about there having been no inspection in the Borough of The Bronx?

A. I said that was the testimony.

Q. Now you understand the laws to have been, prior to July 1st, 1905, when the 22-candle-power law went into operation, that there should be inspection as to candle-power and perhaps in other respects in the various boroughs?

A. Yes.

Q. Do you remember the testimony of Dr. Love, the city chemist that there was no inspection in any borough except in the Borough of Manhattan for candle-power?

A. Yes.

Q. And do you understand that the Central Union operated entirely in the Borough of The Bronx, don't you?

A. Yes.

Q. And you remember the testimony of those who represented the Company, conceding before the Gas Commission that the
3126 Central Union Company did not maintain the candle-power
of even 20 required by the law, don't you?

A. I don't remember that it did not maintain—that there was any evidence as to what its candle-power was, but there was some suspicion thrown upon it.

Q. Was it not stated in evidence that they did not maintain the candle-power required by law?

A. I don't recall the evidence on that, but I recall the statement that it was not believed that they did.

Q. Yes, it was not believed by the officers of the Company who testified that they did.

A. I understood them to say that they did not think they did, but I do not remember any exact evidence on it as to what the candle-power was.

Mr. **Burr**: Have you got the evidence there, Mr. Mathewson?
Mr. **Mathewson**: Yes, some of it.

"*Q.* By Commissioner **Sheddon**:

"Q. Then it was quite evident to the Company that you were not complying with the law along the distributing districts at that time? A. I think if the law had been strictly interpreted requiring a test to have been in the remote districts, it would have been found so."

And don't you remember there was further testimony in the Consolidated Gas Company's case by Mr. Addicks that the candle-power was not maintained?

A. Yes, there was a charge made by other witnesses, but there was no test offered.

Q. There were no tests offered, but as you recall the testimony was it not made quite clear that the Central Union Gas Company was not complying with the requriements as to candle-power in the Borough of The Bronx?

A. What you have just read is quite in line with what I recall, that in remote districts the President doubted whether they were fully complying with the law. The exact sentence that you 3127 read on that point, of course, was in evidence, there is not doubt of it. I don't remember anything any stronger than that.

Q. Do you know whether the Company in The Bronx maintained even 20 candle-power a mile from the works at any time?

A. I know nothing except the testimony there, and that is not positive and relates only to a remote distance from the works, as you read it.

Q. I will read this question:

"Q. So this cost then would not represent the cost of this gas even to the Central Union Gas Company at the candle-power which was maintained by the Company? A. That is true."

Mr. **Burr**: Whose testimony are you reading?

Mr. **Mathewson**: I am reading the testimony of Mr. Doane, I think.

Mr. **Burr**: Who is Mr. Donae?

Mr. **Mathewson**: Mr. Doane was the gentleman who appeared and testified in behalf of the Central Union Gas Company in the case before the Commission.

Mr. **Burr**: He is the president, is he not?

Mr. **Mathewson**: I cannot say whether he was the president, but he was their representative there and knew what he was talking about.

Mr. **Burr**: That testimony was given by him in the proceeding before the Gas Commission?

Mr. **Mathewson**: Yes.

Q. Now we will assume that instead of maintaining 22½ candle-power which you say was the average of the Consolidated Gas Company during this period, that the Central Union Gas Company maintained 17½ candle-power on the average, or 5 less.
3128 What difference would that make in the cost of the gas, the cost of the production?

A. That would make a difference, of course, of about a gallon of oil.

Q. And that would mean about, say, 4¼ cents, would it not?

A. No, about 3¼.

Q. No, I am speaking about the prices paid in New York.

A. According to the testimony it would make 4——

Q. 4¼?

A. No, not at that time—during that period——

Q. 4.08 cents?

A. 4.08, yes.

Q. Now, if you added 4.08 to 27.27, which you think is the cost of the Central Union gas according to their exhibit, that would mean 31.33, would it not, that assumption being correct?

A. 31.35 on those assumptions which I do not assent to.

Q. Well, you don't know whether it is so or not?

A. No, but the evidence does not indicate it.

Q. The evidence indicates there was some difference between the candle power maintained by the Consolidated Gas Company and the Central Union?

A. Yes.

Q. How much it was you don't know?

A. But testimony indicating it in remote districts would not indicate a difference of more than one candle power necessarily.

Q. Well, it would indicate that 27.27 cents for the Central Union gas must have been increased by some amount if it had kept up to the standard maintained by the Consolidated Gas Company?

A. But I have never claimed that the water gas plant was any more efficient than the Consolidated Gas Company. It was only the coal gas I took——

Q. (Question repeated).

A. Yes.

Q. Now, I want to show you Exhibit 171, for the four months ending October 31st, 1905, that is beginning with July 1st, 1905, at which date the inspection of the companies was extended
3129 to all boroughs. It appears by this Exhibit 171 that the cost to the Consolidated Gas Company of the Central Union gas was how much?

A. First let me state that this is not the cost I have been talking about.

Q. I understand that.

A. It is the cost plus ten per cent.

Mr. Burr: The Exhibit 171 to which you refer is an exhibit before the Gas Commission?

Mr. Mathewson: It is offered in here.

The Witness: It is what the Consolidated Gas Company paid for the gas.

Q. That is exactly what I showed.

A. And it shows 35.47 as a total for all the companies.

Q. What does it show that the Consolidated Gas Company paid the Central Union Gas Company for the gas delivered for those four months?

A. 34.35.

Q. Those were the only four months under the present candle power law which were included in the nominal year ending October 31, 1905, were they not?

A. Yes.

Q. If you should divide 34.35, which was the amount paid by the Consolidated Gas Company to the Central Union, by 1.1, it would indicate the cost to the Central Union of the gas delivered, would it not?

A. Yes.

Q. Because the Consolidated Gas Company paid the cost of labor and material plus ten per cent.?

A. Yes, it would make substantially that.

Q. That would mean something over 30 cents for cost, would it not?

A. Yes, about 31 cents.

Q. That would not differ very substantially then from the cost to the Consolidated Gas Company of its water gas, would it?

A. But it does not prove anything on the coal gas.

3130 Q. That may be. What it proves, the Master and the counsel are to argue. What was the cost according to your figures to the Consolidated Gas Company per thousand feet of gas made at its water gas plants for this year ending October 31st, 1905?

A. I give it, do I not, in the testimony?

Q. I think you did, yes, but I thought you had Exhibit 56——

A. I will turn back and see how I gave it here. Because I had summarized the three, 31.29 cents for the three, 29.78.

Q. Then the cost of the Central Union production would be, as I figure it, dividing 34.35 by 1.1, 31.33, which would be practically identical with the cost of the water gas to the Consolidated Gas Company?

A. Those figures would be practically identical, yes.

Q. Now, let me call your attention for a moment to the costs to the Standard Company and the New Amsterdam Company of the gas manufactured by those companies. You said for the year ending October 31st, 1905, for the Standard Gaslight Company it figured up how much, according to table 4?

A. Table 7, isn't it, page 2078? 20.23 cents.

Q. Yes.

A. It is the same table.

Q. That would be about a cent less than it cost the Consolidated Gas Company at their plant, would it not, for the same period, according to your computation?

A. Yes, but it was higher candle power.

Q. Higher average candle power you found?

A. Yes.

Q. Now, taking the New Amsterdam you found the cost was what?

A. 29.01 at the bottom of page 2978.

Q. And those differences you stated you were not able to explain?

A. No.

Q. Now, is it not known to you that the New Amsterdam Company has a water gas manufacturing plant in a single location where its production is concentrated, as against several water gas plants of the Consolidated Gas Company? 3131

A. It is only a trifle larger than the 21st Street plant. It made 20 per cent. more gas only than the 21st Street plant.

Q. Yes, it did make more.

A. And the 21st Street plant was the most expensive of the three of the Consolidated Gas Company.

Q. Yes, the largest plant the most expensive of the three?

A. That would tend to confirm your theory that there is not much difference in expense after you reach a certain point of manufacture.

Q. Yes, it would not only tend to confirm my theory, but would tend to confirm the theory you enunciated in Boston?

A. Yes, if I did enunciate it.

Q. Well, have you any doubt that you did?

A. I think you stated it correctly a little while ago, substantially, that I did not think it made any difference after you reached 700,000,000 feet. I think I said it at that time, and I still believe it. I qualify that, however, where such a large and scientific plant is erected as is contemplated at Astoria.

Q. Yes, I understood you enunciated the general proposition, but when you came to us you made us and exception.

Mr. Burr: Well, you are attempting to build what is the largest plant and the most economical plant in the world.

The Witness: Yes, the fact that it is the latest and most up-to-date ought to give it advantages.

Q. Don't you know, Professor, that it is impossible for two companies manufacturing the same kind of gas in the same city to produce gas exactly the same price at the holders?

A. It would be quite unusual to have them reach that point.

3132 Q. You know for instance in the City of London that the companies there, the three metropolitan companies produce gas at substantially different prices at the holders, each one presumably doing its best, don't you?

A. There are differences and there are also differences in candlepower. I have not them sufficiently in mind now to discuss them on that point.

Q. But you would not expect, taking the three gas companies operating in the City of New York or any other great city, that all the companies would produce gas at precisely the same figure at the holders, and you would presume, would you not, that there might be a difference of a cent or two in the cost of production?

A. Yes.

Q. Did you not find in the City of Chicago that of the two companies, the People's and the Ogden Gas Company, that there was a substantial difference in production in the cost at the holder?

A. So reported by the companies, but when the accountants came to investigate I did not see any report from them about the smaller, or the Ogden Company. But in the report made by the companies there was a difference.

Q. Well, according to the reports of the companies the Ogden Company which produced a smaller amount of gas had a smaller cost of production to the holder than the Peoples' Company, which produced a larger amount of gas, didn't it?

A. Yes, but part of that cost to the Peoples' Company is what it bought from subsidiary companies known as the Universal Company, the company at Cicero and one at Evanston.

Q. And on the other hand, although the Peoples' Company had sales of something like eleven billion feet nearer the Consolidated Gas Company than any other company in the country, you found their cost of distribution was less than the cost of the Ogden?

3133 A. I did not find anything, I simply read in my testimony what they had stated.

Q. Well, that was the statement there?

A. The statement they made.

Q. So far as anything appeared, that was the fact?

A. So far as they stated, but the accountants state the cost of the Peoples' Company, and did not make any report so far as I have learned about the Ogden, so I don't know how it was left. To the best of my knowledge and belief, no report was made about the Ogden.

Q. You have referred to the fact that the New Amsterdam and the Standard Companies had an average candle-power of 23.38 and 23.73?

A. Page 2995, 23.38 for the New Amsterdam and 23.73 for the Standard.

Q. And for the Consolidated 22.5?

A. Yes.

Q. It would appear from that, would it not, that the Consolidated Gas Company has been making greater efforts to keep within the law at an economical rate than those other two companies?

A. Well, I have been told by attorneys that there is a special law relating to either the New Amsterdam or the Standard, requiring 25 candle-power, but I have not verified it.

Q. Well, if they maintained 23½ candle- power, your assumption would not be that they maintained that so as to comply with that law, would it?

(No reply.)

Q. You read Dr. Marks' suggestion that the Consolidated Gas Company was maintaining an extravagantly high candle-power?

A. That was during the last part of the year 1905, as I understood him to say.

Q. You heard him testify that to maintain 22 candle-power it was

not necessary to maintain an average of 24 candle, which the
3134 company was maintaining, but only 22½, didn't you?

A. I did read that testimony.

Q. Well, do you know what the standard of candle-power is in Boston, the legal required standard?

A. 18 in Massachusetts, I think.

Q. Is it not 16 in Boston?

A. Yes, 16.

Q. Do you know what candle power the Boston Consolidated is maintaining?

A. Yes, about 19.

Q. In other words, about 3 candles on the average they maintain, over the legal candle power?

A. I don't understand they did it to obey the law.

Q. What do you understand they did it for?

A. To compete better with electricity.

Q. To please their customers?

A. I suppose they consider it a good policy.

Q. As a matter of fact, they do maintain about 3 candle power above the standard?

A. Yes.

Q. When you speak of the average being 22.5, for the Consolidated Gas Company, and something over 23 for these other companies, you mean what?

A. I mean that these were the averages as given in table 10 of Dr. Love's tests.

Q. How often do you understand the tests were made, from which those averages were taken?

A. Prior to July 1st, 1905, they were only made about once a week, perhaps twice a week on some occasions. After July 1st they were made every day and are so made now every day.

Q. You understand that the law imposes a penalty on the company, not if it fails to keep up an average, but if it falls in any instance below 22 candle power, don't you?

A. I saw that quoted in one of the affidavits of the Complainant, yes.

Q. In your examination of the tests of Prof. Love subsequent to July 1st, 1905, did you find that in spite of the average that the Consolidated Gas Company maintained, yet, on various
3135 occasions, the candle power has dropped to 22 or very close to it?

A. Yes.

Q. You know that Mr. Addicks and Mr. Bradley are gas engineers of experience and standing, don't you?

A. Yes.

Q. Of long experience?

A. Yes.

Q. And you know of no reason, do you, why they should expend money to reduce the profits of the company by maintaining a higher candle power than they thought was necessary to comply with the law?

Mr. **Burr**: I do not think that is material.

The Master: It is fair cross-examination.
Mr. Burr: Exception.

A. I think I do.

Q. You think you know why they should maintain a higher candle power?

A. I think I know why they might maintain it or a reason that might influence them.

Q. Do you know why they did?

A. I don't know their minds, but I can understand a motive.

Q. I should be pleased to have you state it.

A. To make the cost appear as high as possible in this investigation, because this year is to control for probably the next five or ten years.

Q. Have you taken pains to examine the candle power of the Consolidated Gas Company for years before this, when the standard was 20?

A. No.

Q. Don't you know that the excess of candle power over 20 which the company maintained on the average before this inquiry took place was just as great as the excess which is now maintained over 22 candles?

A. No, I have not gone back at all.

Q. It seems to me before I made a suggestion of that kind I would have gone back.

3136 A. I did not make it except as you asked me on cross-examination. I do not consider that dishonorable. I am not charging them with doing anything dishonorable.

Q. I might differ with you. I don't know about that.

A. I do not say that that is their motive. I did not say that. I said I could conceive of that motive. I do not claim to read their minds or know what they are trying to do.

Q. No, but it would have been quite easy for you, these tests being public records, to have satisfied yourself on that point if you had any suspicion that a proceeding of this kind was contemplated?

A. Well, I have thought of it, but I have been so busy night and day that I could not do it.

By Mr. Burr:

Q. You don't know what their instructions were?

A. No.

By Mr. Mathewson:

Q. Mr. Addicks is president of the Company and does not get instructions, he gives them. Let me ask you another question before we take up the subject of oil. We have now taken the subject of residuals and cartage and labor and handling which you state might be due to the cutting off of the plant by the public streets for which the Company is not responsible, and I want to ask you a general question as to labor. Don't you recall that before the Gas Commission the subject of labor was quite extensively gone into and the Company was asked to produce a statement showing the men employed at the different plants and the number of different classes and the wages paid to each?

A. Yes.

Q. And don't you remember examining those and testifying that you found the charge for labor was not excessive and that 3137 you found the charge to be less, as it seemed to you than paid in Chicago?

A. I think I stated substantially that.

Q. So that so far as you can observe or have observed from an examination of the Gas Commission's testimony or the testimony here, there is no instance in which you could criticise the figures paid for the various classes of labor?

A. Labor cost per thousand feet may be high without any individual laborer getting more than the ordinary rate.

Q. Well let us take that phase of it. Are you prepared to say that in your opinion at these plants the Company is employing more men than are required to do the work efficiently in the face of Mr. Bradley's testimony that no one is employed that is not necessary?

A. More men than would be required in an up-to-date plant, I maintain, especially in the coal gas plant.

Q. But so far as the water gas plants are concerned you understand that they are up-to-date, from the testimony in this case?

A. I have not seen the plants, but the testimony of the Company is to that effect.

Q. Now as to the coal gas plants, supposing you were to install charging machinery at one of the plants of the Company where it is not employed, that would mean an expense for machinery which would be added to capital?

A. Yes.

Q. And that would mean additional repairs, would it not?

A. Yes.

Q. When a man wears out, we do not have to pay for his repairs, but get a new man at the same price?

A. Yes.

Q. So there would be offsetting charges, if machinery of that kind were put in?

A. Yes, but Mr. Wood seemed to think on the whole the plants were inferior at 14th and 42d Streets.

Q. But so far as the plants now stand and operated as they 3138 are, you are not prepared to say that any more men are employed to operate those plants than are required to operate them efficiently?

A. I am not prepared to state. I have not had opportunity, in the first place, to study it.

Q. Not being a gas man, perhaps we might doubt your qualification to state, any way. Now, taking up the cost of oil which is the one item left in manufacture, you say that the Boston Gas Company for the year ending June 30, 1906, paid 4.01 cents for oil. Where did you get that information?

A. From the return of the Boston Gas Company, the Consolidated

Gas Company it is now called, to the Massachusetts Gas Commission, for the year just ended, June 30, 1906.

Q. Have you a copy of the return here?

A. Yes.

Q. Will you let me see it?

A. There it is (indicating).

Q. This appears under the heading of average cost per gallon of each kind used at the works, and under that I find naphtha 5.52 cents, other oils 4.01 cents. What do you understand they mean by naphtha?

A. Naphtha is a test above 60—60 to 90. It has been testified to in this case.

Q. Well, do you know what test oil you can get for 5.52 cents in Boston, do you know what test that is actually?

A. I only know what one of your witnesses, I think Mr. Addicks, testified in this case as to what test of naphtha was used—there was very little naphtha used—you know how much percentage of naphtha was used.

Q. I have not got to that point. I am simply asking as to naphtha. Naphtha runs from 12 to 13 cents a gallon or more?

A. Yes, 13 cents, I believe so.

Q. Naphtha is the motive power of most of the automobiles?

A. Yes.

Q. And sells as high as 25 cents a gallon, doesn't it?

3139 A. Yes. The price of the other oil is given here as 5.52 cents for that oil, but there was only one-half of one per cent. of all the oil which was of that character.

Q. Well, you were not quite accurate then in saying that the Boston Company used all 34 gravity oil?

A. I was wrong to the extent of 1 in 200.

Q. Well, where do you find the statement here that they use nothing but the naphtha and 34 gravity oil?

A. I do not find it there except by inference, as far as finding it there is concerned.

Q. Nothing in the report then which supports your statement to that effect?

A. No.

Q. Where do you get that information?

A. From official authority.

Q. What was the official authority?

A. A letter from an official connected with the company.

Q. Who was he?

A. It was not a letter calling for secrecy or confidence, at the same time I don't know whether—if The Master rules that I shall give it, I will. It was a high official of the company. I will show the letter to the Master if you wish it.

The MASTER: I have no curiosity about it, but if Mr. Mathewson wants it, he is entitled to have it.

Mr. MATHEWSON: I should like to see the letter.

The WITNESS: Well, from President Richards. (Witness produces letter.)

Q. Now, he states, "The test of the oil at both stations shows practically 34 degrees." Do you know whether that as used in the gas business would refer to a 34 test oil Beaume?

A. I wrote him asking him what it was, Beaume test, and that is his reply.

Q. You notice this, "Third. So far as we know we do not use any Texas oil?"

A. Yes, I asked him that question.

3140 Q. You referred to the nearness of New York as compared with Boston to the Texas oil field in your testimony?

A. Oil of 27.28 degrees in Texas oil, and I asked him whether they were using any of that and he states they were using nothing but 34.

Q. So if New York was in the same category as Boston it would not be of much importance whether they were nearer Texas or not?

A. But New York is using Texas oil and Boston is not.

Q. The Texas oil you call 28 degree?

A. The Texas oil is 28 degree.

Q. Is any of it 28 degree and over?

A. I have been told so by oil companies.

Q. Now do you notice this "The average candle-power of water " gas made at our Calf Pasture Station for the year ending June 30, " 1906, was 23.13, and at our Commercial Point Station for the same " period 22.7."

A. Yes.

Q. And you found that it reaches the consumer at about 19 candle-power, you stated?

A. The return which they have shows that the average of all the tests, which means of the tests of water gas when mixed with the coke oven and coal gas, is 19.37, as you will find here in this record in copy of the return of the Boston Consolidated Gas Company to the Board of Gas and Electric Light Commissioners of Boston for the year ending June 30, 1906. On page 19 is the statement that the average candle-power of gas as determined by the said Board is 19.37, but that is after this water gas is mixed with the coke oven and coal gas.

Q. That is what I was going to call your attention to. It is not the fact that this Calf Pasture or Commercial Point gas to which I have called your attention is delivered to consumers at anything like that candle-power?

A. No. 19.37.

3141 Q. It is used to enrich other gas, or other gas is used to dilute this, and after they mixing it averages 19.37 candle-power when it reaches the consumer or when it reaches the testing station?

A. That is right.

By Mr. **Burr**:

Q. The writer of this letter is the president of the Boston Consolidated Gas Company?

A. He is.

Q. J. L. Richards?

A. Yes, and the letter is dated October 4, 1906. It is a letter to me in reply to a letter of inquiry. I made no request or suggestion of confidence or secrecy in the letter, but I did not intend to use his name save as the Master ruled I must.

By Mr. **Mathewson**:

Q. You testified before the Gas Commission that oil was higher in the East than the West?

A. I may have testified. I don't remember now.

Q. Well, don't you remember whether you did or not?

A. I know it is higher in the East than it is in the West.

Q. And you testified before the Gas Commission that your information was that it was about 4 cents in Cleveland, didn't you?

A. Yes. It is not that, I have found since. It is lower than that.

Q. Then you are mistaken in that regard?

A. Yes.

Q. Do you know what it costs in Cleveland?

A. I have a memorandum to that effect from the company but I haven't it in mind at the moment. I can tell you to-morrow if you wish.

Q. And didn't you also a year ago in your testimony before the Boston Gas Commission see the contract with the Boston gas companies for their oil?

A. Yes.

3142 Q. And didn't you find that it was 4½ cents per gallon as against 4.8 cents per gallon which the Consolidated was then paying?

A. No.

Q. Didn't you?

A. No.

Q. Did you find then it was 4.49 cents per gallon in Boston or a little lower?

A. That was the average price for the year ending June 30th, 1904.

Q. That was the lowest period which you had in mind?

A. Yes, but we are now talking about a period of two years later, the year ending June 30th, 1906, when the average price was 4.01 cents. It was 4 cents on one oil and enough on naphtha to make it 4.04.

Q. Well, if you were in error in your testimony that is another proposition, but I am asking you whether you did not testify before the Gas Commission here last year, or within the year that you had testified in Boston but a short time before, and that you found that the price which the company was then paying for oil was a little above 4.49 cents?

A. I think so, but that related, and my testimony in Boston related, to the last year for which I was permitted to testify. I was allowed to see all their contracts under the conditions that I should not testify as to the exact prices.

Q. Well, the later contract that you were permitted to see and respecting the exact price of which you did not testify, showed over 4.49 cents, didn't it?

A. No.

Q. It did not?

A. No. My testimony related to what was paid during the year for which I could testify, which was the year ending June 30th, 1904. Now, of course, I will not assert too positively that there may not have been some typographical error or some error in misunderstanding your question, but that is certainly the fact of the case and what I supposed I was testifying. I wish you would produce my testimony if you have any about it.

3143 Q. Oh, no; you have the testimony. I will ask you to examine it and see if my question does not convey to you precisely what you stated?

A. I haven't any copy, except Mr. Burr has a copy which has been loaned to the stenographer.

Q. I ask you to review your testimony and be prepared to state at the next hearing whether you did not testify so before the State Gas Commission.

A. The New York State Gas Commission?

Q. Yes.

A. All right.

Q. And whether the contract which was shown to you when you testified before the Boston Gas Commission on the last occasion theretofore was not the current contract?

A. Well, that may be.

Q. Well, that is what I say; the current contract was shown to you at the time that you testified before the Boston Gas Commission and it showed that the Boston Gas Company under that current contract was paying a little over 4.49 cents per gallon for oil, didn't it?

A. No, it did not.

Q. You are sure about that?

A. 4.49 or something like that was what the company had been paying but the contract which they showed me was not a contract by which I could testify because I had agreed not to.

Q. No, in the Boston Gas Examination you did not put any figure on the record as to what the company was then paying for oil, and wasn't this contract shown to you in order to satisfy you that they were not paying too much and didn't you say after seeing the contract that you were satisfied that it was all right as to oil?

A. I saw two contracts. The contract covering the period of their report to the Commission and the contract for the next year which was lower, but I was not allowed to state what either contract was because I agreed not to by agreement between the attorneys.

Q. What was the contract the year before?

3144 A. I don't remember now. I have the notes at the hotel of both contracts.

Q. What year was covered by the 4.49 cents?

A. There is no use guessing. I will look up the testimony if you wish.

Q. Well, I want you to look up the memorandum so you can tell us?

A. I know that was generally made during the Boston hearing and when that occurred was in the early part of the year 1905 and was a contract just made, if I remember right. I don't know whether it had gone into effect or not, but it was a contract for the next twelve or fifteen more months or two years, I don't remember just how long and I think I was shown the contracts under which they had been operating.

Q. You did testify before the Gas Commission here, did you not, that it was of the highest importance that the Company should be assured at all times of the delivery of oil to them, without failure of delivery on account of strikes or otherwise?

A. Yes.

Q. And that they should procure it from such sources as they would be assured of a supply and run in no danger of running short, or that in substance?

A. I don't know whether I so testified but I believe it so. That equally applies to Boston, Philadelphia, Baltimore and all the cities.

Q. And is it not the fact that a Company like the Consolidated Gas Company of New York, which uses a vast amount of oil and which can obtain that oil from, we will assume, but a single producer, is at a disadvantage as compared with a small company whose requirements are so small that it can get the oil from various producers, and can store an amount with reasonable expense, bearing a larger proportion to their annual requirements than the Consolidated could?

3145 A. I cannot say. It depends on the character of the Standard Oil Company and the directors.

Q. Just leave out the Standard Oil Company and the directors for a moment. Assuming there is but one producer which produces oil enough of the grade required for the Consolidated Gas Company, isn't the Consolidated Gas Company of New York on that account, other things being equal, at a great disadvantage as compared with a small company which might deal with half a dozen different producers, any one of whom could furnish it the amount required?

A. No, because it can divide its contracts; it can do as Philadelphia does, have one station supplied by one company and another by another.

Q. You think that would be feasible, do you, in running a gas business in the City of New York?

A. Yes, just as coal comes from different companies to the Consolidated—eight or ten different companies supply coal.

Q. There is quite a difference, isn't there, in that connection when you are dealing with oil and coal?

A. One is no more important than the other.

Q. How about storage? Is it easier to store coal than it is to store oil?

A. I cannot say. Coal is more bulky. I don't know.

Q. It is safer, isn't it?

A. It is safer. That is, oil is not considered as safe to store, but coal will catch fire from spontaneous combustion, so it is rather difficult to store coal in large quantities. I do not recall at the moment an instance of oil stored at gas works anywhere having exploded or burned up.

Q. You do not recall the case of any gas company storing oil for the greater part of its annual requirements, do you?

A. No, and I have not assumed it would be necessary if it got it from several companies.

3146 Q. Don't you know as a matter of fact the Company has to get its oil from time to time and keep on hand a very short supply?

A. I don't know its amount of storage tanks or what it might construct of additional storage tanks.

Q. It would be a pretty expensive proposition, wouldn't it, to construct tanks of sufficient size on the Island of Manhattan?

A. I have not testified that obtaining oil from different companies would necessarily involve that any more than in the case of coal.

Q. Have you been a purchaser of oil for gas manufacture?

A. No. And the oil at Lynn, you will notice, was only three cents.

Q. Yes, I understand that is your statement?

A. That is the lowest test, 28 degrees; one was 28.

Q. 3.29 cents for 28?

A. Lynn, 28 degrees gravity, for 3 cents; Lowell—I thought I introduced Lowell—yes, on the previous page, 2991, 29 degrees test, 3.13 cents.

Q. Where do you get your information as to those grades?

A. I get one of those from an official of the company and another through a friend from an official.

Q. You say that all the oil used in Boston is 34 gravity oil. You heard the testimony that the Consolidated used half 28 gravity oil, did you not?

A. Ninety-one per cent. is 28 gravity in the year ending October 31, 1905.

Q. Yet you think that Boston used 34 gravity oil entirely, practically?

A. Well, that is the statement I get from the president of the company.

Q. That would indicate, would it not, that the Consolidated Gas Company was operating very skilfully if it used 28 gravity oil to the extent of 91 per cent., a cheaper oil, whereas Boston was using all 34 gravity?

3147 A. It would indicate a good management after the oil reached the plant, certainly.

Q. Is it your statement of belief that the company will come back with 50 per cent. of 34 grade oil for the future? Did I understand you to state that?

A. This company only has expected that according to this contract as made in October, 1905, and the testimony indicates that it was not expected to use even as much as 50 per cent. the year around, but only in the winter months. I should say then, yes, to your question. In fact, the New Amsterdam and Standard go along even and produce a higher candle-power with the 91 per cent. of this low grade oil.

Q. Let me call your attention to your Boston testimony, page 492 of the record:

"By Mr. Auerbach:

"Q. After having examined the contract for the purchase of oil by the Boston and Bay State Companies of the company that sells to them, do you find any explanation in the price of oil which you need to give, which accounts for the higher manufacturing cost of the gas sold by these companies? A. Do I find any explanation?

"Q. That they cannot make gas at the same price as other companies because they pay too much for oil, which price you need not give? A. I have not found an explanation for the higher cost of Boston except one in the line of manufacturing cost and one in the line of distributing costs."

Now, you were dealing at that time with the price at which the companies could produce gas as a basis for an argument that the selling price ought to be reduced because companies then could produce gas for a certain price, weren't you?

A. Certainly.

3148 Q. Well, do you mean to say then that the contract you were talking about when you were testifying on that subject was a contract which was not then in existence but a contract which had been in existence some years before?

A. No. What I mean to say is that the company had entered into a contract at a reduced price for oil but which was to cover a year which had not then been completed. We were in the midst of a fiscal year during the testimony and at a later time I expected to be called in rebuttal where more would have been said upon it, but as I was not, Mr. Babson in his argument for the City stated, as I recall it—and I was present at the time and handed him the slip which he used—that the cost to the company would be less for the current fiscal year owing to the lower price of oil, the exact reduction being something I was not permitted to state.

Q. And you didn't know when I asked you as to what they were paying in Boston for oil and you said it was 4.49 and a little over that I was referring to the latest contract which was shown you; is that right?

A. I don't recall what I had in mind at the time, but I know this much that at that time I did not have the knowledge which I now possess of what they did pay during the year ending June 30th, 1906. They may have made another contract since the one they showed me. In fact the contract they showed me, as I recall it, was for two different grades of oil, different prices for each grade, and according to the proportion of each which they used would be the total average cost of oil per gallon, and at the time you asked me the question I did not know what proportion of each they were using, neither did I know whether they had made any new contracts, and 3149 & 3150 I am now giving the late information, only recently obtained, regarding the entire year ending June 30th, 1906.

Mr. Mathewson: I intend to take up another subject, but as it is about 1 o'clock perhaps I might as well suspend here.

The Master: Yes, if you have come to a good place. Now, as we are not to sit this afternoon, can we not start to-morrow morning at half past ten?

Mr. BURR: Yes.

Mr. MATHEWSON: Yes.

At 1 P. M. adjourned to October 19th, 1906, at 10:30 A. M.

Last Exhibits:

Complainant's, 256.
State's, W.
City's, 59.

3151 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *Oct.* 19, 1903.

Present: The Master, Mr. Mathewson, Mr. Kirby.

Mr. Burr sends word by a representative that he is ill and unable to proceed this morning and asks for an adjournment. There
3152 being no objection, the application is granted.

Adjourned until Monday, October 22nd, 1906, at 1 p. m.

Last Exhibits:

Complainant's 256.
State's W.
City's 59.

NEW YORK, MONDAY, *October* 22, 1906—1 p. m.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

EDWARD W. BEMIS resumes the stand.

Mr. BURR: In last Thursday's testimony you made some corrections in the printed copy of the testimony and stated there might be other changes when you had time to read over your testimony? Do you desire to make such corrections now, and, if so, what are they?

A. I will only make now those which seem the more important, leaving for private conference with the stenographer the minor changes.

Page 2960, near the bottom, occurs the line, "cost up to the time that the gas reaches the holder." It should be "cost up to the time that the gas leaves the holder."

3153 Page 2969, middle of page, occurs this statement of mine: "in exhibit 23A, page 1745, of the typewritten testimony;" it should be "page 174;" the "5," in other words, does not belong there.

Page 2972, the last line of the table, is subsequently referred to in my testimony, page 2977, as *as* "totals inserted by the witness," as in parentheses, to the effect that the totals appearing at the bottom of table were then inserted by the witness. That is correct, only the totals are not inserted; the totals there *in* page 2972 are not the totals I inserted, but the totals in the original exhibit, for that exhibit took into account sales under the Agency Agreement, and I excluded those, so I want to put in now the figures for the last line of table, page 2972, in place of those that are there.

By Mr. BURR:

Q. The last line of 2972? You mean the last totals?

A. Yes, the last totals. Instead of the figure "$645,616.55," it should be "$778,464.23;" and instead of ".3026," it should be ".3022.

Page 2984, in Table 8, 5th line, under 42d Street, the figure 11.54 should be 11.64. Then the last line of the long table on the same page, under 42d Street, where it is now 34.74 it should be 34.77.

By Mr. MATHEWSON:

Q. It is so in your tables. Is it merely an error in the copying of them?

A. Yes, but I thought you should have it. And, again, under 14th Street, where it is 37.77 it should be 37.73.

Q. That is wrong in the table, then?

A. Yes, some of these are my mistakes and some are the printer's. Now the very last line of the same page, where it is 25.59 under 42d Street it should be 25.29, and instead of 24.98 it should be 24.94.

3154 Q. Those were both errors in the table, weren't they, Professor?

A. I don't remember now. I have not stopped to see.

Q. Well, it so appears on mine.

A. There were two or three different copies made at different times and I had it corrected on one sheet and didn't have it corrected on some other sheets.

On page 2985, as a result of these other changes near the bottom where the figure occurs, 25.26 cents, it should be 25.09.

Q. Shouldn't it be above that? It should be 25.29 in your testimony, on page 2985?

A. I am figuring it out now. I think it should be 25.09; and the 11.77 should be 11.60. These changes are not large, but I thought I ought to tell you of them, as I believe they are slight errors.

By Mr. **Burr**:

Q. Is that 25 and——

A. I have got it 25.09.

By Mr. **Mathewson**:

Q. In the second place, also, on page 2985?

A. Oh, there are two places on the page. It should be 25.29 where it occurs first on the page, because that is a repetition of the table on the previous page. When I started to correct those now I said I was correcting the last part of the page. I did not notice I had made in my own page corrections in the middle of the page also; so, to make it clear, in the middle of the page 2985 the figure 25.59 should be 25.29, and in the next line the figure 24.98 should be 24.94. Then further down the same page, only about eight or nine lines from the bottom, where the figures 25.26 cents occur it should be 25.09 cents, and where it is 11.77 cents, on the same line, it should be 11.60.

Then on page 2989, about ten lines from the bottom, where
3155 the figure 11.77 is repeated, it should be 11.60. That makes
a slight change in the dollars—only a little over $4,000, but I mention it. $330,687.27 becomes $325,911.98.

Q. How about the 11.77 cents four or five lines above?

A. Well, where it occurs it should be the other figure. Then on page 2996, in harmony with these other changes, about ten lines from the bottom, where it is 7.87 it should be 7.85; and then, instead of its being $838,140.26 in the next line it becomes $833,364.96; and the next line instead of $13,969,000 becomes $13,873,020.

Q. Are these clerical errors made by the stenographer or are they errors in your testimony?

A. The latter errors were mine, following my taking a wrong start, but they don't make changes that amount to anything really; still I thought I would correct them. I think they were mostly mine.

Now, page 3000, near the bottom, after the figure in the line beginning "which would reduce the cost from 33.52 to 26.68," the "which" should be "and;" and after 26.68 cents it should read "per thousand feet of gas sold;" or after either, for that matter.

On the next page, 3001, 5th line, instead of the words "solely for that in" should read the "last two and one-half months of."

Page 3007, the table, second statement in the table, occurs the words "taxes and dividends in excess of 4 per cent. on $38,643,590.14 stock invested in"; after the word "in" it should read "other companies."

Page 3052, the next day's testimony, the last line, the last figure, 73.63 should be 78.93.

Page 3066, last line, before the last line should be the word "exceeds," so it should read, "the total increase in value exceeds the entire amount spent for repairs and renewals by $4,676,497.58."

At the bottom of page 3074, next to the last line, the fig-
3156 ures "in 1883" should be omitted, so as to read, "Now the
consumption actually fell off a little from 1893 to 1895? A. Yes."

Page 3085, a mistake I made in computation on the spur of the moment here at the table. I looked at the wrong figure here in a column and it changes it as follows:

In the sentence beginning in the tenth line it should read, "Now during that period the per capita sales increased from 3,288 feet to 4,550 feet, a period of ten years, and there was an increase per capita of 1,253 feet, or 125.3 feet per year."

By Mr. **Burr**:

Q. What becomes of the balance of the sentence?

A. All the other sentences I leave. Page 3094, sixth line from bottom, the words "in the" should be "no," so as to read, "and no increase per meter."

Page 3096, the fourth line, after the word "deduct" should read "from the amount." And in the next line, after the word "have" before the word "reached" should be "not," so as to read, "have not reached."

On page 3123, on the next day's testimony, the word- in the seventh line from the bottom, "per cent." should be changed to "cents;" 1.27 per cent. should be 1.27 cents.

The last change I have noticed, save very minor ones, is on page 3140, third line; instead of 27.28 degree, it should be 27.28 degrees.

The **Witness**: Now, before the cross-examination continues, I would like to call attention to a letter I have just received from President Richards of the Boston Gas Company, as a continuation of his previous letter to me, evidently. Shall I have the privilege of referring to it? It is intended to be sort of a correction to his
3157 previous letter. He says "In your letter to me from Cleveland, dated October 1st, you asked if the oil used by us during the year ending June 30th, 1906, was 34 degrees gravity, and I replied to you on the 4th of October that it was 'practically 34 degrees.' I find on a further and more thorough investigation that we used a considerable amount of oil averaging 29 degrees gravity during the period referred to, but finding that in cold weather we could not get the desired candle-power with the low gravity oil, we obtained during the cooler weather oil of about 34 degrees gravity, thus bringing the average gravity of the oil used by us during the year ending June 30th, 1906, substantially below 34 degrees. I write the above to correct any wrong impression you may have obtained from my former communication on the subject."

Now, I have assumed that from the two letters, one saying practically 34 degrees and the other saying there was substantially less than 34 degrees on account of the reasons he gave, not having any better guide, I have assumed one-fifth was 29 degrees and the other four-fifths 34 degrees.

Mr. **Mathewson**: Do you think it is worth while to assume these things? Can we not assume the same things, Mr. Master, if we want to?

The **Master**: I think so, probably.

The **Witness**: The 3.13 cents for 29 degree oil paid in Lowell, remains undisputed.

The **Master**: You may proceed.

By Mr. **Mathewson**:

Q. I have not seen any evidence except as to hearsay——

A. I will produce it now if you like.

3158 Q. I don't think you have any evidence, if you don't know yourself.

A. I have a letter here.

Q. I don't think that is evidence. It is a subject for cross-examination, however——

Mr. **Burr**: You can bring it out on cross-examination.

Q. You observe that President Richards says he found it impossible to maintain the candle-power in Boston which you say was about 19, without the use of 34 gravity oil?

A. 19.37 for all after it was mixed——

Q. Yes, whatever it is——

A. He had a much larger proportion of coal gas to mix than they had here.

Q. You observe he says he was unable to maintain even the 19 candle-power which you say was delivered in Boston without the 34 degree oil?

A. It is much colder there.

Q. And that the candle-power is much lower, isn't it?

A. Yes, sir.

Q. Do you know the proportions of coal and water gas in Boston?

A. I think I can tell you in a minute. The water gas made during the year ending June 30th, 1906, was 1,421,194,000 feet and the coal gas made was 304,340,000 cubic feet, and the coal gas bought was 2,262,654,700 feet, so that out of about four billion feet that was either bought or made, 1,421,000,000 or about 35½ per cent. was water gas.

Q. How do you know that the coal gas came into Boston at all and did not go to some of these subsidiary companies, roundabout?

A. Which gas?

Q. Not in the Consolidated Company, the coal gas?

A. That was bought from Everett. The sales to private consumers and the city by the Consolidated Company was 3,479,998,565 3159 feet, and since the gas, both coal and water gas, that was made was only 1,725,534,000 feet, the other half of the gas sold in Boston must have come from Everett.

By Mr. **Burr**:

Q. What do you mean by Everett?

A. Well, the coke oven plant at Everett which makes coal gas, sells gas to Boston and Boston therefore gets gas from three sources; it gets it from the coke oven plant at Everett and then gets some from its coal gas station and some from its own water gas station.

By Mr. **Mathewson**:

Q. You don't know whether it is sent to Roxborough, Brookline, Dorchester or Jamaica Plains, or what proportion went into the pipes of these companies?

A. No. It is all treated as one company now.

Q. Yes, but they are different pipes and different systems.

A. I think they are laced up together at present.

Q. Before we leave this question of oil in Boston, I want to call your attention to the fact that you testified the other day that when you testified in Boston in the fall of 1905—it was the fall of 1905, wasn't it?

A. I testified—I have written out that whole statement here——

Q. No, no, what was the date?

A. Well, the testimony is page 234 of the printed statement, which was reprinted for this case.

Q. Leaving that out, when did you testify in Boston last?

A. It was in the neighborhood of January, 1905.

Q. But you said you were testifying for the year ending June 30th, 1904, in dealing with the cost of gas in Boston, is that right?

A. Yes.

3160 Q. And that a contract was then shown you which did not deal with the year ending June 30, 1904, or did the contract then shown you deal with that year?

A. In my testimony at that time I did not refer to a contract. The contract was shown to me later.

Q. Well. the contract which was shown you later in that hearing and which you referred to in your testimony here?

A. Yes.

Q. What period did that contract cover?

A. Just a minute. I have it all here. It covered the year—it was dated May 9th, 1904, and was to begin to run from July 1st, 1904.

Q. Did the contract so provide that you saw?

A. Yes.

Q. And what were the rates in that contract?

A. That I have never testified to because it was agreed that I should not state what they were.

Q. Did you not say that that was at a lower price than the four and one-half cents average which you testified in the Gas Commission hearings the Boston Company was paying?

A. I was asked, "Wasn't it as high as 4.49 cents?" And my answer was, "Yes."

Q. Well, to what contract were you referring when you said it was as high as 4.49 cents?

A. This contract that I was shown in Boston that was to begin to run from July 1st, 1904.

Q. But you said that there was a contract which you were shown at that time which ran at a lower rate than an average of four and one-half cents?

A. Well, I find I was mistaken in that. I will say this——

Q. Will you look at this paper I show you (handing paper) and say whether that is a copy of the contract of May 9, 1904, to which you refer?

A. Yes, it is similar to the notes I have here of it.

Q. Will you point out where in that contract there is any provision that it shall begin to run on July 1st, 1904, instead of 3161 at its date?

A. No, I do not find anything here, but I have a note to that effect taken at the time. Perhaps it came in the course of conversation.

Q. It evidently is not in the contract?

A. I do not see it there. I had made the note at the time and Mr. Richards was present while these contracts were produced by him, and I must have got it from some remark made at the time.

By Mr. **Burr**:

Q. Do you know that the paper produced by Mr. Mathewson is a copy of the contract shown you in Boston? If you don't, say so, and if you know, say so, also.

A. It appears to be quite in harmony with my notes in every respect, so far as I can determine it.

By Mr. **Mathewson**:

Q. I state that that is a copy which I have procured, or purports to be a copy. You have no doubt that it is?

A. I have no doubt that it is.

Q. This contract of May 9th, 1904, which you say was to begin to run July 1st, 1904, for the next year, calls for a large quantity of oil at 4½ cents per gallon, an average of 4½ cents per gallon, to consist of one-half of the Texas product at 4 cents and one-half of the northern gas oil at 5 cents, does it not?

A. Yes.

Q. So that this letter covers the period during which you were testifying in Boston, and the year beginning July 1st, 1904, and ending June 30th, 1905, as you understood it?

A. Yes. It did not cover the year for which I have given figures in this testimony.

Q. That is, it did not cover the year ending June 30th, 3162 1904?

A. No, June 30th, 1906, I just meant to say.

Q. It does not cover either the year ending June 30th, 1904, does it?

A. I understood that it was to take effect July 1st. If it did take effect a month earlier or a month and a half earlier of course I was mistaken to that extent.

Q. Do you know what the Boston Gas Company——

By Mr. **Burr**:

Q. What does the fact appear to be from this copy you have been handed by Mr. Mathewson as to the time that that contract to which you have alluded is to begin to run?

A. It does not state. There is only a difference, to my mind very immaterial, between May 9th and July 1st, of 1904.

Q. But please be accurate as to the times that these contracts are to commence to run. If you are sure of it, that is one thing——

A. There is nothing in this contract that shows when it is to begin to run.

Q. There is nothing in this paper which you have been handed to show when the contract, if that is a contract, is to begin to run?

A. That is right, and I had the note that I suppose that I got at the time from a conversation with Mr. Richards that it was to begin to run July 1st. If Mr. Mathewson asserts that it began to run May 9th, I have only to say that I have this note and it may be wrong.

By Mr. Mathewson:

Q. Were you not referring to this contract of May 9th, 1904, a copy of which I have shown you when you said that the price of oil in Boston at the time you were testifying in the gas case
3163 before the Gas Commission in New York was as high as 4.49 cents?

A. I was referring to that contract.

Q. Now as a matter of fact, do you know what the Boston Gas Company paid for its oil on the average for the year, ending June 30th, 1904?

A. I do, I think.

Q. What was it?

A. In that year they paid—the Bay State Company paid 5 4-5 cents, and the Boston Gas Company 5.7 cents.

Q. Per gallon?

A. Yes. Then they made this contract——

Q. Of what grade?

A. Then they made this contract which was lower, and they may have it down still lower since.

Q. That you have already testified to, and it is not necessary to repeat it, as it takes time. What grade was this oil which averaged 4.49 cents for the year ending June 30, 1904, to the Boston Company?

A. I am not positive that I have information on the subject, but I believe I have information that it was to some extent a higher grade of oil than they are now using and I don't think they were using any 28 degree or 29 degree oil.

Q. You wish to correct your testimony of the other day when you said that that contract was not the one which was shown you?

Mr. Burr: Well, which contract—what contract do you mean?

Mr. Mathewson: May 9, 1904.

The Witness: I don't know what you refer to. Will you point to the page?

Mr. Burr: Are you referring to a paper which you have just held up to him?

Mr. Mathewson: This copy of the contract of May 9, 1904.

3164 The Master: Why not mark it for identification or read it, because it makes the record a little blind in looking it over afterwards.

Mr. Mathewson: I hardly think it is necessary. He has referred to it and he stated the figures which it provides.

The Witness: I have my testimony and I do not see any conflict between my testimony and what I say now.

Q. Didn't you say at the time that the contract which was shown to you in Boston was a contract which provided for a lower rate than four and a half cents?

A. I will read:

"Q. And whether the contract which was shown to you when you testified before the Boston Gas Commission on the last occasion theretofore, was not the current contract? A. Well, that may be.

"Q. Well, that is what I say, the current contract was shown to you at the time that you testified before the Boston Gas Commission and it showed that the Boston Gas Company under that current contract was paying a little over 4.49 cents per gallon for oil, didn't it? A. No, it did not.

"Q. You are sure about that? A. 4.49 or something like that was what the company had been paying, but the contract which they showed me was not a contract of which I could testify because I had agreed not to."

Q. I referred to the current contract at page 3143, and asked you if it showed that the Boston Gas Company under that current contract was paying a little over 4.49 cents per gallon for oil, and you answered, "No, it did not." Now don't you wish to change that?

3165 A. I think I do. That contract I thought was lower because the price became so much lower in the next year. Now I have never seen that lower contract, and not having it in my hands and not having seen for months the contract which I did see in Boston——

Q. I simply asked you the question as to the current contract and you answer that you do wish to correct your testimony, and it was a little higher than 4.49?

A. Yes. That is, it might be higher. It depends altogether on whether they used the proportion they had the right to use.

Q. Does not the contract of May 9, 1904, state that it shall average 4½ cents?

A. Yes.

Q. Now on page 1304 of the Gas Commission testimony, where you testified in respect to the price of oil, appears the following?

"Q. So that oil is no higher here apparently and not quite so high as it was in Boston, is it? A. That is true.

"Q. And if it was four cents in Cleveland and higher in the east, it could not have been a great shock to find it was 4.49 in New York? A. The figure given me in Cleveland was an offhand statement from one of the officers who said he was not sure."

Q. Now I understand that you have testified here since that you find you were mistaken about the cost of oil at Cleveland?

A. Yes, the cost of oil in Cleveland is 2¾ cents last year.

Q. Let me call your attention to the statement presented to the Commission of Gas, Oil & Electric Light in Chicago, as it appears in the pamphlet which your counsel, Mr. Burr, has quoted from occasionally, and see if I quote you correctly: "The City of Cleveland is one of the largest——

Mr. Burr: Referring to what page?

3166 Mr. Mathewson: 20.

Mr. Burr: And the date when this was given?

Mr. Mathewson: December 27th, 1905, it appears on page 4 as the date of Professor Bemis' appearance, and this statement appears from its heading on page 16 to have been given on December 29th, 1905.

Q. (Continuing:) "The City of Cleveland is one of the large cities that charges 75 cents for its gas. In Cleveland they get their coal and oil cheaper than they do here, and there they have to compete with natural gas, and in addition to the ordinary taxes they have to pay a franchise tax amounting to 5 cents per thousand feet of gas. Oil and coal are cheaper there; I don't know the exact figures, but the treasurer and vice-president of the company told me they were paying 4 cents for gas oil there. Labor also is cheaper in Cleveland than here." Now is it true that the treasurer and vice-president of the company told you that the charge was 4 cents?

A. Yes, in a street car one day, and he told me at the time he was not sure.

Q. Is that what you refer to in this testimony, when you state before the Gas Commission "The figure given to me was an offhand statement from one of the officers who said he was not sure?

A. Yes.

Q. You did not state in this statement to the City of Chicago that you were not sure anywhere, did you?

A. I don't know.

Q. Well, if you did I would like to have you show it to me?

A. That is only a condensation. I don't remember that I did, but I have since seen the contract, and it is 2¾ cents.

Q. Cheaper even than it is in Chicago?

A. I don't know the price in Chicago.

3167 Q. Didn't you testify before the Gas Commission that your information was that it was about 3 cents in Chicago.

A. I never had definite information. One engineer who went around with me refused to tell me, but from some remarks he made I thought it might be in that neighborhood; but afterwards I felt it was not sure. I had seen no contracts or definite statements.

Q. Didn't you testify before the Gas Commission that your best information was that it was about 3 cents?

A. Yes, I think I did, but don't remember precisely and I did not feel positive about it.

Q. Referring to tables 8 and 9, the first is at page 2984 of the record, comparing operating cost at the Central Union Coal Gas Station and at the 14th and 42d Street coal gas stations of the Consolidated Gas Company. You stated at page 2987 of this record that if the Consolidated Gas Company received for its coke the same amount which you computed as received by the Central Union "This only means a difference of 1.01 cents per thousand feet distributed over the 2,809,586,000 feet made by the 14th and 42d Street stations. Will you show how you procure that result?

A. By turning back to the previous page I gave a table——

Q. Table 9?

A. Yes, and that tons of coke sold, the dollar mark does not belong there, 57,844.06, multiplied into the 15 cents, gave the $8,676.61

and the 56,932.93 tons at 42d Street multiplied into 33 cents, the difference there per ton, gave me $18,787.87, and then I added the two, making the $27,464.48, which is a little more than a cent if distributed over the 2,809,586,000 feet.

Q. You say it is a little more than a cent. It is 1.01 cents?

A. Yes.

Q. Did you not divide the amount in dollars into the amount of feet which would give 1.01 instead of dividing the other way?

A. That is possible.

3168 Q. In other words, you reversed the process completely?

—. But it is——

Q. It happened to come to perhaps not over two or three tenths of a cent difference?

A. It does not come out that much?

Q. But you should have divided the amount in dollars by the number of feet, should you not, instead of the other way?

A. Yes, that is what I thought I had done, but when I came to look it over, I found it was about the same.

Q. You divided the other way and then displaced your decimal point and that brought it somewhere near right?

A. There is not a difference of over a tenth of a cent?

Q. But there would have been if you had pointed off your decimal properly, when you divided originally, you would have got about $9,000 or $99,000 instead of about one cent.

A. I don't know how it was done but I did this in giving it. I glanced through and saw that one cent would mean about that amount and did not stop to go through the full computation again. It is .98 of a cent instead of 1.01, a difference of .03 of a cent.

Q. Yes, you have this time divided the amount of dollars by the number of cubic feet, haven't you?

A. Certainly.

Q. Now, you have reached that result, as I understand it, assuming that the arbitrary figure at which coke is transferred back and forth between coal and water gas plants, is really that figure at which the coke of the company is sold or could be sold in the market. Now, let us see if we cannot find out a little more accurately what the difference per thousand feet due to coke would amount to. Will you take from table 8 the 13.49 cents which I understand includes your computation for coal gas at the Central Union station, after deduction for oil and repairs——

A. Yes, that was the figure.

3169 Q. —and now take the 14th street station, which is 24.94 cents according to your corrected figure this morning after a like deduction.

A. Yes.

Q. Now, you deducted the oil in reaching these two figures because the gases might at the time you compared them have been enriched to different degrees?

A. Yes.

Q. So you thought that was fair. But, as a matter of fact, the Central Union Station, as you have said, has more machinery, and therefore the repairs would therefore naturally be larger than they would at the station which had less machinery?

A. The repairs are larger on coal gas than water gas, but these are repairs on the coal gas separate.

Q. I understand, but as between two coal gas stations, the coal gas station which has the most machinery and the least hand labor would have higher repairs, as you said the other day, than the one with less machinery and more hand labor, because you don't have to repair you- *man*.

A. Yes.

Q. Therefore, in order to be fair in this comparison, we must leave the repairs in because that is a part of the efficiency of the Central Union plant.

A. You cannot determine that very carefully and accurately—you could over a period of three or four years, because——

Q. But the Central Union appears to be 4.48 cents and the 14th street 3.79 cents?

A. Yes.

Q. And the repairs at the Central Union station should be somewhat greater on the average, having more machinery. Now, will you add those repairs to the 13.49 cents for the Central Union and the 24.94 cents for 14th street, and see what we have, eliminating only oil?

A. In other words, add 4.88 to the Central Union and that makes 18.37 cents; now add 3.79 cents to the 14th street would make 28.73 cents.

3170 Q. Now, have you a copy of the Central Union testimony here?

A. No, I did have the other day.

Q. You understand in the Central Union and all these other cases the exhibit was made up, showing in considerable detail what was received for different products, at your request, upon the order of the Commission?

A. Yes.

Q. Well, now, I will show you that exhibit and ask you to look at page 212 and see how much coke was used in the generators at the Central Union.

A. It is an exhibit I have never seen.

Q. It is on file with the Gas Commission and also on file with the printed case on appeal, where Mr. Mayer, one of the defendants here, represented the State.

A. I have never seen it though. Page 212?

Q. Yes. Give me the amount of coke used in the generators.

Mr. Burr: Let us get this straight, if you please. This purports to be Exhibit 22 before the Gas Commission, appearing upon the printed record, being the papers on appeal in the matter of The Commission of Gas & Electricity in the matter of the complaint of H. Brown and others against the Central Union Gas Company, page 212.

Q. If you will give me the amount of coke used in generators?

A. Water gas; amount and value of coke used in water gas generators?

Q. Yes, that is the coke transferred from the coal to water gas plants. Just the amount in dollars, I do not care for the amounts, but just the dollars?

A. $34,177.41.

Q. And the amount used under the boilers?

A. $3,204.15.

Q. That seems to be the coke used in water gas which came from the coal gas station?

A. Yes.

3171 Q. Page 214, coal gas, coke used, $2,626.05?

A. $2,626.05.

Q. And the amount sold, page 215, that is the amount sold in the market and not merely transferred between stations?

A. What page do you say it is?

Q. Page 215.

A. Amount and value of coke sold or available for sale out of the year's product $114,810.02.

Q. Yes. Well, that represents all the coke of the Central Union Company which was transferred from the coal gas plant to the water gas plant and used in generators and that transferred to the water gas plant used under boilers and all the coke produced which was used at the coal gas plant and all the coke which was sold; in other words, all the coke of the company?

A. Yes.

Q. Now will you give me the total amount upon those figures for the coke of the Central Union Company, which will be simply the addition of those four items.

A. $154,817.63 appears to be the amount and value of coke produced, whether used or sold, as given at the bottom of page 214.

Q. Now will you divide that by the total coal gas made by the Central Union Company which appears at page 132 of that record.

A. 670,518,000 feet; that divided into $154,817.63——

Q. I make it 23.09 cents.

A. That is what I make it.

Q. The result is 23.09 cents per thousand feet of coal gas manufactured, is it not?

A. Yes.

Q. Now will you look at page 2142 of the printed record before the Gas Commission in the Consolidated case and tell me the amount realized for the coke of the 14th Street station of the Consolidated, all of this being for the nominal year ending October 31st, 1905, respecting which you have testified?

3172 Mr. Burr: As it appears on that page. Is that an exhibit?

The Witness: It is Exhibit 149.

Q. It is $178,527.11, isn't it?

A. Now you ask me to do what?

Q. If you will state the amount received for the coke produced at the 14th Street station for the nominal year October 31st, 1905?

A. Before or after deducting the cost of handling, labor and cartage?

Q. 178,527.11?

A. That is before the deduction.

Q. Yes, you have already dealt with the labor of cartage and handling in your table previously.

A. Was it on the same basis in the Central Union that I just figured?

Q. So far as I know.

A. The figure is $178,527.11.

Q. Now, divide that by the amount of coal gas made at 14th Street station, which appears on page 2145 of the same record to be 1,360,284,000 cubic feet, and see how many cents per thousand feet produced that would mean for coke.

A. It would be 13.1 cents plus.

Q. 13.12 cents, I make it, if that is right?

A. Well, I guess so.

Q. And if the Central Union receives 23.29 cents for coke from its coal gas and the 14th Street station receives 13.12 cents that would mean that the Central Union received how much per thousand feet of coal gas made beyond that received by the 14th Street station?

A. 9.97 cents.

Q. Now, if you will take your figures at the foot of table 8 and add 9.97 which is the difference received in coke to the 18.37 of the Central Union, it will make how much.

A. 28.34.

Q. As against 28.73 for 14th Street?

A. That is right.

3173 Q. So that upon that showing the difference would seem to lie almost wholly in the amount received for the residual coke as between 14th Street and Central Union stations, with practically no difference in operating cost outside of that?

A. Well, there is a difference in labor cost although——

Q. Yes, but those smaller items seem to adjust themselves back and forth so that there is practically no difference?

A. On that basis I shall have to look into the coke matter further before I see what other facts enter into it. Of course those computations work out that way.

Q. We have now been proceeding in the figures in the exhibits which include the figures at which coke is transferred back and forth from the coal gas to the water gas plants as well as upon the amount received for the coke which is sold by the two companies in the outside market. Will you look at page 414-A of Exhibit J.

A. In this case do you mean?

Q. Yes. And tell me the amount of coke aside from screenings coming from 14th Street plant and the amount received from it for the calendar year ending December 31st, 1905?

A. I don't know if I am looking at the particular figure you suggest from 14th Street station on account of coke transferred?

Q. No, coke sold I am referring to now, so as to get at the market price?

A. Coke sold by 14th Street you say?

Q. Yes.

The WITNESS (continuing): Sold to outside parties?

Q. Yes.

A. Yes. I thought at first this was perhaps an exhibit of several stations.

Q. No, I am now getting at the difference per thousand feet on account of coke sold by the Central Union and the 14th Street plant of the Consolidated on the basis of market prices; that is, 3174 what they can sell it for in the market or do sell it for?

A. Coke sold to outside parties 117,940.7 tons?

Q. No.

A. Loads.

Q. Oh, loads, yes.

A. Being 260,118.34.

Q. That is for both 14th and 42d Streets, the two coal gas plants, Professor, and of course we only produce coke at those two plants, you understand?

A. Yes, exactly.

Q. Then that means, according to my computation, 78,308.51 tons?

A. Counting a load as 1,500 pounds, I suppose?

Q. Yes. Will you take the screenings for 14th and 42d Streets and tell me the amount received for them?

A. Screenings 33,155.5 loads; $30,114.14.

Q. And that if I am correct means 27,847.88 tons?

A. Yes.

Q. About 2,000 pounds to the ton?

A. Excuse me. May I ask you how many pounds you give to a load?

Q. 1,500 for coke and 2,000 for screenings.

A. Then there would be the same number of tons and loads, wouldn't there?

Q. I am talking about long tons, 2,240 pounds to the ton. That would make how many tons all told, coke and screenings, and how much received for——

A. Well, taking your computations on what it amounts to in tons——

Q. If you have any doubt about it verify it if you wish to, Professor?

A. No, I haven't at present. It would be 106,156.39 tons. And did you ask the price?

Q. Yes, the total.

A. $290,232.48.

Q. At how much per ton on the average?

A. $2.73 plus.

Q. 2.733?

A. Yes.

Q. Now, will you take the amount of coke sold by the Central Union, which you stated to be from the exhibit, $114,810.02, 3175 and will you kindly reduce the pounds to tons and say how many tons that represents—the long tons, the same as the Consolidated?

A. I make it 26,787——

Q. 26,787.65?

A. Yes. It was not quite 26,788.

Q. You are willing to accept the decimal as I will give it—26,787.65?

A. Yes.

Q. And that would mean how much per ton for the coke for the Central Union?

A. Dividing that into $114,810.02 is what I must do. Well, it is nearly $4.29.

Q. I make it $4.285.

A. Yes, I think that is right.

Q. Then based on the sales by the Consolidated and by the Central Union to outside parties the Consolidated receives $2.733 per ton for its coke against $4.285 for the Central Union, or a difference of how much per ton?

A. I do not understand this exhibit yet to be able to state whether I assent or not to your statement that these are prices actually received. I am making these computations, but I do not want to assent to anything further on the basis of these computations. There is a difference between 4.285 and 2.733 cents——

Q. Well, they appear in the same volumes and appear to be *bona fide* exhibits, the same as those from which you have computed, do they not?

A. Well, how these figures are obtained I cannot say, because I am very clear in my mind that there was another exhibit I used giving the value of the coke used in making water gas which was very different.

Q. To what are you referring when you say you cannot say from what source these figures are derived the Central Union exhibit?

A. Yes, the Central Union exhibit gave very different figures from the value of the coke used in making water gas, so I must go over these exhibits very carefully to reconcile them. I do not understand them yet.

3176 Q. As far as the Consolidated exhibits go, those you have been over very carefully?

A. Yes, sir.

Q. And on the basis of this exhibit which is a part of the printed case on appeal in the Central Union case, the computations you have just made would seem to be correct, wouldn't they?

A. Why I think the figures are correct, but what they mean I cannot tell till I look them over further.

Q. Don't they appear by the exhibit to be exactly what I have stated?

A. They are in such conflict with that other exhibit of the Central Union before the Gas Commission that I am not prepared to say.

Q. This is the exhibit of the Central Union before the Gas Commission to which I have just called your attention?

A. But being one which I have never seen before I shall have to take a little time to look it over. I cannot do it in a minute.

Mr. Burr: The last exhibit is Exhibit 22, is it not, Mr. Mathewson? The one you refer to, appearing on page 210 of the printed case to which reference has been made previously.

Mr. Mathewson: Yes.

The Witness: I will call attention to the fact that I did not appear in the Central Union case as I did in the Consolidated a year ago. I prepared data for questions for Mr. Ford, but I never saw the answers. This is the first I have seen of this.

Q. And requested that information to be presented in this form for all the companies?

A. Yes.

Q. And assuming that this exhibit in the Central Union case to state the fact, the results would be sufficiently computed, wouldn't they?

A. Why, I think I have computed carefully, but what they imply I should not want to say until I took really a night's study.

Q. I do not think you have answered as to what the difference
3177 would be between the $4.285 and the $2.733.

A. It is $1,552.

Q. Per ton?

A. Yes.

Q. Now, in your testimony before the Gas Commission you had before you Exhibit 93 in this case or its equivalent, showing the cost of gas for the nominal year ending October 1st, 1905, did you not?

A. I had part of it at least. I think it had all been handed in but I am not sure when I testified that I had examined more than the consolidation of it all in a single table. Whether I had before me a separate return for each company I am not sure.

Q. What do you mean by a separate return for each company, because this relates only to the Consolidated Company?

A. Oh. That was Exhibit 145. That is the one. I meant to say that I was not sure whether I had it fully in my possession but I did have what is in Exhibit 93.

Q. Didn't you also have Exhibit 145 before the Gas Commission which showed in details the items of this?

A. That was handed in at the time I testified but I don't think I had very fully examined it.

Q. Well, the cost of the gas made, not sold, at the station, appears in Exhibit 93 to be 32.84 cents, for the nominal year ending October 31st, 1905. Now in your computation of the proper charge of the cost of gas, as given before the Gas Commission did you make any deduction from the station cost at all?

A. No, I was not then aware—I had not had opportunity to analyze these other companies. In fact, the exhibits had not yet been made in the Central Union, or the Standard, or the New Amsterdam at the time when I testified.

Q. So that your present action in deducting something from the station cost which appears in Exhibit 94 for the calendar year 1905 to be 32.77 cents, or a little less than for the nominal year,
October 31st, 1905, is based on the exhibit showing the
3178 operation of the other companies in the City of New York,
which subsequently came to your knowledge.

A. And on studies of oil.

Q. Well, you had before you before the Gas Commission all the testimony in respect to oil that appeared in the gas record, didn't you—in the record in that case?

A. I didn't have these later figures in Massachusetts at all.

Q. Do you then base your deduction at this time on the fact that you had the statements of these other companies and also on the further fact that the oil is obtained at a lower price in Boston?

A. Boston and Lowell and Lynn.

Q. Were not the data available in reference to those in the office of the Commission in Massachusetts in 1905 when you testified?

A. The data for the year ending June 30, 1906, had not been delivered to the Commission.

Q. But for all previous years it was there, wasn't it?

A. Yes. I did not get it though because I didn't have time.

Q. You know that the cost of oil for the nominal year ending October 31st, 1905, as shown in Exhibit 93, is only 4.04 cents per gallon?

A. Yes. 91 per cent. of it was oil that cost only three cents in Lynn.

Q. Because the greater part of that year—in fact all the cold part of that year came under the 20 candle-power rate, you remember?

A. Yes.

Q. Now, referring to candle-power, do you know what the penalties are in Boston for failure to maintain candle-power?

A. No.

Q. Do you — what they are in New York under the present law?

A. I have noticed some testimony about it in this case.

Q. Do you remember Mr. Cowdrey's testimony in Chicago, or his statement that you must make an allowance of two candles between the candle-power at the station and at the limits to which it is sent?

3179 A. I think he said something of that kind between at the station and at the limits. I think he may have. Others dispute that.

Q. Mr. Cowdrey is the manager of the Laclede Gas Works in St. Louis, isn't he?

A. Yes. I heard others say differently.

Q. He is a man of large experience?

A. Certainly.

Q. Assuming that the penalty is $1,000 for each offense in not maintaining candle-power, and that the tests take place daily, as they do under the present law, would it not be necessary in prudence to maintain a higher candle-power above the standard than what would be necessary if a penalty were affixed only for a failure to maintain the candle-power for three consecutive tests taken a week apart?

A. If what you state is true the law is more rigid.

Q. And there would be required a larger margin of average candle-power in order not to fall at any time below the maximum?

A. Yes.

Q. You have referred to the removal to Astoria, Professor, as probably resulting in certain economies. Do you remember the testimony of Mr. Bradley that the economies which he had in mind had been obtained so far as the water gas was concerned?

A. I remember that he testified about having affected some economies which he had previously had in mind.

Q. And that he had no idea that he could make coal gas at Astoria any cheaper than he is now making water gas in New York?

Mr. Burr: I don't think that is the testimony.

Mr. Mathewson: Yes, it is.

Mr. Burr: Then you had better refer to it specifically. 3180 Mr. Bradley started out by saying before the Gas Commission that he could economize up to five cents, and afterwards he said here whether he could economize was problematical. Now, that is my recollection of the testimony.

Mr. Mathewson: Mr. Bradley testified before the Gas Commission it would make a difference of five cents, and subsequently stated he referred to the coal gas and that that economy had been already made, and that he had reference as well to 20 candle-power and not the 22 candle-power which prevailed at that time. He also stated he could not produce coal gas cheaper at Astoria than water gas is now produced in New York.

Q. You understand that Astoria is wholly a coal gas plant?

A. Yes.

Q. And as to what the result will be at Astoria will depend considerably, will it not, upon what they are able to obtain from their coke as a residual?

A. Yes.

Q. Coke is a substance which is very easily damaged, is it not, by storing and by transfers?

A. It is affected by it. It is injured by it.

Q. The amount of screenings increased?

A. Yes, sir. I did not mean to say that the question of residuals would be the sole economy—the sole thing that would effect economies at Astoria.

Q. Well, but you have said that after the plant has an output of 700,000,000 feet or such a matter there is practically no further economy in connection with production?

A. But there would be a great economy over 14th and 42d Streets.

Q. But you have in mind that 14th and 42d Streets now produce about one-fifth of the gas of the Company, have you not?

3181 A. Yes, but as regards that coal gas, 2,800,000,000 feet per year, I think there would be great economies at Astoria.

Q. Assuming that at Astoria you were able to make a saving of five cents on that coal gas?

A. I think it ought to make ten cents.

Q. Well, some of us do not believe it, but assume that it made ten cents saving at Astoria, below the present cost, that would make a difference in the total output of the gas of only two cents, including water and coal gas, would it not?

A. About that.

Q. And if there was a reduction of five cents in the cost below 14th and 42d Street, that would mean a difference of only one cent in the total volume of gas?

A. I think they ought to do as well as the Central Union; that is my point.

Q. Before we get through perhaps it will appear we are doing as well now, aside from what we get from our residuals. Your figures this morning would seem to indicate it. And if we have a coal gas plant operating at Astoria of course we would not have to use this high priced oil to which you referred, but how about coal. We will have to use coal instead of oil, will we not, very largely?

A. Coal and coke. Oh, yes, coal for coal gas.

Q. And how are you going to enrich it to 22 candle-power? You cannot get that 22 candle-power gas out of coal, can you without any enrichment?

A. No, I testified there would be oil used but not as much used per thousand feet.

Q. Wouldn't there be just as much oil used in enriching coal gas at Astoria as there would be in enriching it on Manhattan Island?

A. Yes, that is true. I meant as much as in making water gas.

Q. But so far as coal gas which we are now producing is concerned and which would be produced ultimately at Astoria, it would take just as much oil to enrich it in one case as in another?

A. Yes.

3182 Q. So that the economy to which you refer by the use of oil would only come up in connection with surplus gas produced beyond that?

A. Yes, instead of enlarging the water gas plants or in substitution for the water gas, to some extent.

Q. Well, let us see about that. You understand that the sales of the Consolidated Company for the past calendar year were 13,283,000,000 or thereabouts, and that it only produced something over 10,000,000,000 feet itself and obtained under the Agency Agreement 3,000,000,000 feet more.

A. Yes.

Q. And you observe that that gas that it obtained under Agency Agreement represented a station cost of 33.38 cents, by Exhibits 94, as against 32.68 cents for the gas manufactured by the Consolidated?

A. Yes.

Q. Both being very largely water gas?

A. Yes, that is true.

Q. And the first unit at Astoria with its capacity of 20,000,000 feet per day maximum capacity would mean, according to ordinary computation, an annual capacity of about 4,000,000,000?

A. Yes.

Q. So that the first unit, costing, as the testimony is, something like $10,000,000, exclusive of land and tunnel, would only take care of the amount of gas which the Company is now procuring from other sources, and make a very small margin over to take care of this expected increase?

A. I did not think it would be a substitute at all for the gas it gets from other sources.

Q. You did not think it would be?

A. No.

Q. Why not?

A. Because it is much cheaper to buy that gas at the price they are paying than to pay interest on a plant to make it. In other words, the ten per cent. as margin over and above operating cost is less than interest and depreciation on a plant, I think.

3183 Q. Did you know that a suit was pending already against one of these companies from which the Consolidated receives gas because it delivers gas to the Consolidated for the figure that it does, the claim being that it is too small a figure to represent cost and return?

A. No, I am not acquainted with the lawsuit.

Mr. Burr: *The* which suit does counsel refer? To the suit now pending with this suit in the United States Court?

Mr. Mathewson: No. I merely asked the witness if he knew that the suit was pending. He says that he did not. That seems to end it.

Mr. Burr: Neither did I know, and it does not make any difference to the issues here or to the defendants.

The Witness: In my belief the Astoria plant will be used as a substitute for the coal gas plants and, to some extent, for the more expensive water gas wherever they choose, and in providing for increased consumption. As I understand it, there is a second unit under way at Astoria, so as I understand there are to be 40,000,000 feet capacity.

Q. What about the companies in New York which now have a surplus production, if there is any increase of output as you have computed by reason of any reduction in the price of gas? Won't the other companies here need the surplus here to take care of their own increased production?

A. The Mutual has 9,000,000 feet a day surplus capacity—I don't know that the others have very much. In fact, the Astoria plant, as I have just said a second ago, would be used in part in providing for increased demands for gas. I said that just now. That was one of the ways in which I thought it could be used.

3184 By Mr. Burr:

Q. In Manhattan or in Queens?

A. Anywhere where it can be most advantageously piped. Sold to Brooklyn perhaps.

By Mr. Mathewson:

Q. Now, you have figured a reduction in the cost at Astoria, 6.69 cents, if I get it correctly, upon the make of gas with the opening of the Astoria plant. Is it your idea that the coal gas plants here will be immediately abandoned as soon as that is opened?

A. The manufacturing portions of the plant, I think, will soon be discontinued. Not the holders or the land and some things about them.

Q. How soon?

A. I don't know. I believe comparatively soon.

Q. How do you make up this 6.69 cents? How much of that is oil and how much something else?

A. That, I think, appears in evidence.

Q. Isn't that made up, that 6.69 cents, that gain made up on the theory that there will be a saving in the production of all the gas that is made and not merely the coal gas which is made at 14th and 42d Street stations?

A. It assumes that the water gas will be made as cheap as the New Amsterdam and Standard make it, and it assumes that the coal gas would be made as cheap as the Central Union makes its coal gas, after making full allowance for the difference in oil and then it provided more oil on the Massachusetts prices.

Q. On what you say to be the Massachusetts prices?

A. Yes.

Q. Because the Standard and Central Union as a matter of fact do not now manufacture their gas at figures representing what you say is the Massachusetts cost of oil?

A. No. According to the exhibits they do not.

3185 Q. What do you mean when you say that the economies at Astoria will be sufficient in your judgment to be six per cent. on the entire investment? On what entire investment?

A. Well, I used the figure—well, I said it would be six per cent. on the $15,000,000, did I not?

Q. I am not quite clear what you did say or mean.

A. I was trying to find the place in the testimony where that was brought out.

Q. Don't you remember to what you did refer?

A. Yes, but I wanted to refer to the page. It was about $15,000,000. Six per cent. on about $15,000,000 was the saving and I used $15,000,000 in connection with the cost at Astoria.

Q. What becomes of the two coal gas plants which you say you would abandon? How about the valuation of those?

A. I think that has been taken up in the—that is, the part abandoned has been taken up in the repairs of the last twenty years in excess of the $9,000,000. In other words, I allow 10.89 cents for repairs, renewals, depreciations and contingencies, and so far as there is any strength in the complainant's testimony about the increase in value of the plant over and above nine and one-half million dollars since 1884, to that extent that figure is too high, and to that extent it will wipe out the 14th and 42d Streets investment.

Q. Then your argument that the 14th and 42d Street plants would be wiped out is based on that theory you have just stated?

A. I think it is cared for by that.

Q. Is it cared for by anything else, because if it is I should like to know what?

A. Why, I don't have in mind anything else now.

Q. Well, we will deal with that subject of 10.89 cents a little later, in order. You testified in Chicago about the time you were testifying before the Gas Commission, did you not, that all of the plants, or practically all of the plants of the Consolidated Company were to be removed to Astoria very promptly? 3186

A. Whatever I stated I stated.

Q. Don't you remember whether you did or not?

A. I don't remember that I stated that all of them were.

Q. Practically all?

A. I don't remember just what I stated.

Q. Well, when you came before the Gas Commission, how many did you state were going to be removed?

A. Whatever the testimony says.

Q. Don't you remember?

A. No.

Q. Do you really mean that you don't remember, or that you don't want to state?

A. I should rather you read it. I don't remember it exactly. Whatever you read I will accept but I don't remember it exactly. Only I do remember this, that the company had been testifying as if a larger amount was to go to Astoria at that time than what the testimony since then has seemed to indicate, and I don't find now as much evidence of the intention of the company to vacate the property on the Island as I did when I read their returns to the State Gas Commission, when they proposed to "scrap" it off, or "scrap" over most of it.

Q. You say this in substance:

"In other words whatever the cost you have changed your mind " since you testified in Chicago on that subject? A. Yes, sir.

"Q. Yes. A. Well, I should change it only to that extent, make " it one or two instead of three or four, to that extent."

A. I have in mind that Addicks testified that the 14th and 42d Street stations would be likely to be the first to be abandoned, and things of that kind.

3187 Q. The testimony as to purpose of abandoning the plants here by way of replacement at Astoria was before the present act was passed of the present order was made reducing the price of gas to 80 cents, wasn't it? You understand that?

A. You say that the construction at Astoria was begun?

Q. No, the testimony of Mr. Addicks as to the intention of the company to remove its plant to Astoria instead of merely — produce a plant to take care of any excess as well as their present production, was given before the act was passed reducing the price to 80 cents?

A. I think in this case since then there has been some reference to 14th and 42d Streets being likely to be abandoned first. I think so.

Q. Well, I should like to have you look that up and show it to me some time. I haven't seen it.

A. Well, I don't remember where it was but I have that in mind.

Q. I would like to have you take Exhibit 94, which is the cost of gas for the calendar year 1905. You took for the actual expenditures the figures, as shown in this statement?

A. Yes.

Q. And questioned the propriety of charging some of them to the cost of gas. Dealing with these now I am assuming that the amount properly expended and that it is simply a question of where they should be put in?

A. Some were not expended, as I understand it.

Q. No, we will reach that in a moment. Now, as a matter of fact you first deducted the fixed charges from 74.81 cents?

A. Yes.

Q. That left 67.10?

A. 67.49. Then there was deducted interest on consumers' deposits, which was .39 of a cent; that would be 67.10.

Q. In other words, you deducted fixed charges and interest on consumers' deposits?

A. Yes.

Q. Now, Messrs. Addicks and Humphreys both deducted fixed charges, so there is no difference, as far as that is concerned?

A. No.

3188 Q. Interest on consumers' deposits they did not deduct. That makes a difference of .39 of a cent between you and them?

A. Yes.

Q. Now, with reference to the contingent expenses which are stated here at ten cents, contingent expenses including renewals and replacements, you deducted that and substituted what?

A. Substituted 5.31, I think it was.

Q. Yes, that is right.

A. It appears in table 13, page 3009.

Q. That makes how much, deducting the ten and adding the 5.31?

A. 62.42 cents.

Q. Now those represent the only deductions which you made from this Exhibit 94, if I assume that the expenditures for oil and other items were of proper amount, does it not, with the exception of the item of street lamps of $289,259.09?

A. No. I made other deductions.

Q. What were they?

A. Miscellaneous income was another.

Q. Just let me correct you for a moment. There is nothing on Exhibit 94 about Miscellaneous Income.

A. Oh, yes. Excuse me.

Q. I am getting now at the expenditures of the Company?

A. Well, I made a change in taxes. Did you ask a question?

Q. As to what you made? Another deduction for taxes?

A. Yes.

Q. I thought you were about to state what that was?

A. It was from 7.27 cents to 6.08 cents, as explained in Table 12 (page 3007); it was a deduction of 1.19 cents.

Q. If you deduct 1.19 cents from the previous amount you get what?

A. 61.23 cents.

Q. Now, in connection with taxes, you deduct taxes on income from other companies' securities amounting to $5,257.48 taxes on dividends in excess of 4 per cent. on $38,643,590.14, stock 3189 invested in securities of other companies amounting to $57,965.39 both of which amounts you found that Messrs. Humphreys and Addicks included?

A. Yes, I think they did.

Q. Then in addition you took the interest on unpaid taxes $94,506.29 for that item?

A. Yes.

Q. Can you tell me how many cents this amounts to, $94,506.29, so I can see what the difference is in cents per thousand between you and these two gentlemen as to that item?

A. I shall have to divide it. I will divide by the gas sold which was 13,283,164. .71 of a cent I make.

Q. .7 of a cent?

A. Or .71.

Q Now that with the exception of the street lamp item to which I referred a moment ago includes all the deductions you made, assuming the amount of these items to be proper?

A. Yes, I think so.

Q. And that leaves you how much?

A. 61.23 cents.

Q. Now in 1905, testifying, you allowed the Company three cents for reserve or contingent fund?

A. Yes.

Q. Three cents per thousand feet on the theory that they were to remove to Astoria or were otherwise entitled to that reserve, did you not?

A. Yes.

Q. Now, I will ask you prior to taking up that subject to say how much your present computation would amount to if you add three cents to the 61.23?

A. 64.23, but in my testimony before the State Commission I deducted for lamps and miscellaneous income——

Q. I understand?

A. Which I have not done yet, I think.

Q. I understand. We will reach that point in a few moments. We are now dealing with the question of expenditures. Now on the subject of street lamps, they are included in this statement, and is it not a fact that the lamps are included in the expense of 3190 manufacture according to the form adopted by the Massachusetts Gas Commission?

A. Yes.

Q. And also the form adopted by the Gas Commission of the State of New York?

A. Yes. I am not sure about the latter.

Q. It is the same, I think. Did not Mr. Teal in his computations—Mr. Teal being the accountant of the Stevens Committee—leave the expenditure for the care and maintenance of gas lamps in his estimate of the cost?

A. Yes, but, of course, if you do that you have got to take the receipts not at one dollar, but one dollar and three cents or something.

Q. That is another proposition and we will come to that in a minute. But there is very substantial authority then for leaving this in the cost?

A. Yes. I stated that.

Q. I think with those authorities before us we will leave it so for the purposes of our present computation. Now, if you deduct that $289,000 which is expended in maintaining lamps from the operating cost of gas you will also deduct a similar amount from the receipts of the company?

A. Certainly.

Q. So that the difference between the operating cost and the receipts of the company which will be the fund available for dividends or interests on bonds, will be exactly the same in either case?

A. Certainly.

Q. So it is simply a question of how you should treat it?

A. That's right.

Q. Now, as a matter of fact the company gives certain attention and care and makes certain repairs, you know, upon the apparatus of private consumers, doesn't it?

A. Yes.

Q. And the dollar they receive from private consumers covers both the gas thus delivered and also the care that the company gives to the apparatus of the consumer, that is correct, isn't it? He gets it in no other way that you know of, does he? 3191

A. I don't know what they charge for special services.

Q. Well, they do not charge anything for those services?

A. I suppose they do not.

Q. Then the dollar received from consumers covers both the gas delivered and the services rendered to the consumer?

A. That they call advertising generally.

Q. No matter what they call it.

A. Some repairs to meters and services they charge to repairs. Repairs to stations, I think, they charge it.

Q. But even those repairs are received back indirectly and ultimately from the money they receive from the consumer, and so, too, where the company makes a contract with the city by which it furnishes gas through lamps and at the same time takes care of the lamps, the lump sum it receives from the city covers both maintenance of the lamps and the gas furnished to the city?

A. I think there is a separate contract for that.

Q. No, not this year.

A. Well, a special statement in the contract to cover each point; special paragraphs.

Q. For some of them but not by any means recently. The contracts this year, as the evidence shows, are almost wholly for Welsbachs and they are for a fixed sum covering gas and care?

A. Is that true for this Exhibit 94 for the period covered by this exhibit?

Q. Yes, the same.

A. Yes. However that would not make any difference in my view of the case.

Q. It is a fact but it would not make any difference in your view of the case?

A. No.

Q. But you and I do not differ in this proposition, I suppose; that this expense of care and maintenance here to private parties or of city lamps is an expense that the Company has to make as preliminary to getting back its money from the consumer? 3192

A. I treat them both alike. When it receives money from the consumer for the rent of gas stoves, I take that just as I take what it receives from the City for the care of lamps.

Q. Now, let us take up the subject of miscellaneous income. You now have, including 3 cents reserve, 64.23 cents after deducting consumers' deposits and these amounts for taxes, all contingent expenses of 10 cents per thousand except an amount equal to the average of the twenty-one years, and fixed charges, and we find that the miscellaneous income altogether amounts according to your table No. 11 to $177,710.53?

A. Yes.

Q. How much is that per thousand feet?

A. I think 1.34 cents.

Q. And if you deduct that from your 64.23 cents you get how much?

A. 62.89 I make it. We have not yet deducted the lamps.

Q. If you deduct that from the operating cost of gas you must also deduct that from receipts on the other hand?

A. Certainly.

Q. And there will be no difference whichever way you treat it?

A. There will be quite a difference in——

Q. In what you call the operating cost of gas?

A. Yes.

Q. But so far as the main thing we are looking to, which is the amount of our profit to be deduced by the cost of gas, subtracted from the receipts, there will be no difference whatever because you will have to deduct it from both sides of the account if you deduct it from either?

A. That's right.

Q. So that, aside from the method of treating it in reaching the profits of the company available for dividends, the only difference between you on the one hand and Mr. Addicks and Mr. Humphreys on the other, is that you have deducted lamp expenses of .39 of a cent and you have deducted $94,000 of interest on unpaid taxes, making a total of about 1.1 cent, as I figure it? 3193

A. I do not recall now whether they deducted the miscellaneous income or not.

Q. Yes, they did in that case. But whether they deducted the miscellaneous income or not from the operating cost, it would make no difference whatever, would it, because if you deduct it from the operating cost, you also deduct it from the receipts?

A. Yes.

Q. So it would be merely a different method of treating it in reaching the amount of profit available for dividends?

A. Yes, and I have done the same with the lamps.

Q. But, if the lamps are to remain in as an operating cost, that would make 61.23 cents as the operating cost before deduction of miscellaneous income; or if you allow three cents for reserve it would amount to 64.23 before deduction of miscellaneous income, or 62.89 cents after you have deducted 1.34 cents miscellaneous income?

A. Yes.

Q. Those figures I think I have quoted correctly. Now, in reference to this interest on unpaid taxes, which is $94,560.29 and which amounts to .71 of a cent, why should we not be allowed to charge that expense in the operating cost of gas?

A. Because you resisted taxes and it goes out of your own dividends, if you choose to—of course you may get it back, you may win.

Q. You understand the directors of a company are trustees for the stockholders and bound to protect their interests?

A. Exactly. That was a gamble they took on the dividends.

Q. Assuming that the company has assessed against it a tax as to which its counsel advises it that it is of sufficient doubt that it should
be tested in the interest of stockholders, and it is tested that
3194 the company is unsuccessful, is it your theory if they acted
with reasonable prudence in testing that tax that they are not
entitled to charge that as an operating cost to their business, whether it is a gas company or an industrial company or a railroad company?

A. I should think the tax itself which was originally assessed if you had to obey it would be a tax and cost, but this is extra interest that was paid by reason of not paying the tax promptly.

Q. Yes, but if the interest accrues because they are advised by counsel that there is a sufficient legal question to say that the tax should be tested?

A. Well——

Q. And assuming that they act with reasonable prudence in testing a tax in the courts and they are defeated and have to pay interest on that tax when they come to pay it, isn't that, just the same as their attorney's fee in the case, a proper charge against the operating cost of the property?

A. Well, it looks to me rather as a gamble on the dividends.

Q. In other words, being a gas company, your theory is that they must not test even a doubtful tax unless they are prepared to take the interest on the tax if beaten out of their dividend instead of charging it as any other corporation does as an operating cost of the business?

A. I think it should come out of the dividend if they lose.

Q. If they win, how about that? Should it then go to the favor of consumers of gas?

A. No, they get it in the dividends then.

Q. Don't you know that taxes are constantly tested and fought for the express purpose not only of setting aside the existing tax but for the purpose of preventing the imposition of higher taxes in the future?

A. Yes.

3195 Mr. Burr: Are you referring to the action of this company?

Q. Do you not think that it is a prudent action therefore of the trustees, and that if they make a test on a tax with that in view, that it will ultimately come to the advantage of the consumers in preventing the increase of taxes?

A. Well, I have not thought so far as that, as to anticipate that.

Q. If it be a judicious action in the interest of lower taxes, which of course are an operating cost of gas, then any such thing as interest on taxes when it comes to be paid would be properly charged against the operating cost?

A. The consumer does usually get the benefit of these taxes.

Q. But he gets the advantage of high taxes, if they are accumulated, doesn't he?

A. It depends, of course, on limits.

Q. Don't you find that the taxes against the company here in the City of New York, 6.08, being after the deduction you have made, is a very substantial item in the cost of gas?

A. Certainly.

Q. And don't you think it is the duty of the trustees of the company in the interest of their stockholders, as well as the interest of the consumer, to maintain their contention that it is beyond a figure where it should reasonably and properly go?

A. Well, I should think there would be great limits to their duty, but of course, within certain bounds, which I won't attempt to fix now.

Mr. Burr: Do you want to appreciate the property for the purpose of capitalization?

Mr. Mathewson: Please do not interrupt, Mr. Burr.

A. I was about to add——

Q. But within certain limits you said, and what would be the conclusion?

3196 A. Within certain limits they would naturally seek to keep the taxes at a reasonable figure, but I think that when it goes so far as to incur a large interest change on the unpaid taxes, that there they are running a risk which should come out of dividends if they lose.

Q. Now, Professor, speaking perfectly frankly, is it not a matter which rests in the fair discretion of the directors of a corporation as to just when and how far they shall contest such matters as taxes which they may consider to be excessive as levied against them.

A. All expenses in *quasi-public* corporations must depend to some extent upon the judgment of the public as to their fairness, as well as the directors; the public is a silent partner in all *quasi-public* corporations.

Q. That may be a question to be debated, and I don't know exactly what you mean by the statement, but we will not debate it here.

A. I mean it is different from a private business.

Q. I see that in these items of miscellaneous income which you say should be credited appears stove rentals $122,322.60, forming the greater part of the $177,710.53 and therefore the greater part of the 1.34 cents which is the total of miscellaneous income. Supposing the Company went out of the business of renting gas stoves, that item of income would fail, wouldn't it, at once?

A. You mean if no other Company took its place?

Q. If this Company went out. Yes, if it determined to furnish no more gas stoves on rental or sales, but to leave the consumer to to go to a hardware shop, that source of income would immediately terminate?

A. I don't understand that they would abandon their title to the stoves they now own and which appear in their inventory of assets.

Q. I am talking now about the miscellaneous income.

A. They would continue to get a rental on the stoves they now own, or so far as it brings them in a rental now it would continue. It would not increase if they did not buy any more stoves. 3197

Q. You know some companies do not deal in stoves at all, and some companies furnish free stoves?

A. Yes, sir.

Q. And if this Company thought it was wise to furnish free stoves, as many well-managed companies do, then there would be no income at all from stove rents?

A. Just the same as if they thought it wise to reduce the price of gas, it would reduce their income.

Q. But at the same time the expenditures would remain the same?

A. Yes, but this is not a condition which confronted me in this exhibit.

Q. But that is a condition which might occur?

A. Yes, sir.

Q. And didn't you testify before the Gas Commission that it might be just as well to add the stove rent to income, and that there was room for that argument?

A. I don't remember. I may have said so. I don't think so now.

Q. You don't think you did say so?

A. No, I don't think so now, that it should be.

Q. If you didn't so testify then you have changed your mind?

A. I don't remember what I testified.

Q. Well, if you did so testify——

Mr. Burr: I want to call counsel's attention to the fact that there is no evidence that many well-managed companies do furnish free stoves.

Mr. Mathewson: The Professor can correct that if it is not so. I have no objection to his correcting it.

The Master: I understood him to say that that was the fact.

Mr. Mathewson: Yes.

3198 The Witness: I was looking over that matter the other day over seven or eight of the larger companies in Massachusetts, and I think only two or three had any stoves in their assets. I don't know very much about the cases of those two or three companies who do have them, but I think there are—I believe there are—some companies that do not charge stove rentals. I am not prepared to say whether the majority of companies furnish stoves free or not, but I feel it is fair to take this company at what it is now doing as the basis of our present discussion.

Q. You do not remember then whether you said before the Gas

Commission that it might be just as well to add stove rentals to income, instead of deducting them from distributing expense?

A. I don't remember now.

Q. Will you look at the original Gas Commission minutes at page 1579——

A. The typewritten testimony?

Q. Yes.

A. I haven't it here.

Q. I will be glad to let you look at it. I have it at the office.

A. If you say I did so testify, I will not dispute it. I simply said I did not remember it.

Q. That is my minute of it. Now, if I understood you correctly, after certain deductions, you obtained a figure of 29.09 representing the balance of the items which were included in distributing expense and stated that you divided that into four items which appear on table 13?

A. Yes, page 3009.

Q. What are those four items into which you divide this 29.09 cents?

A. I must first say—I have the table before me but I was looking for the testimony. It is 29.11 cents, I have it on page 3008, and in another place 29.09 cents. The testimony shows at the bottom of page 3007 that I deducted the 1.19 cents from 30.28 cents to get the 29.09 cents.

3199 Q. Now, what were the four items which you said you divided the 29.09 cents into, and don't they appear on table 13?

Mr. Burr: Excuse me. In the middle of the page that 29.09 cents seemed to be changed into 29.11 cents. Is that the same, or which is the correct figure? You say that 29.11 cents should be divided into four items and you also refer to 29.09 cents in that connection?

The Witness: For the moment I do not remember, but I suppose the four items I must be referring to are the four which appear on table 13.

Q. Yes, I so took them down; 3.56 cents, 6.08 cents, 5.31 cents and 7 cents; but making the same supposition that you do now, that those are the four items making up the 29.09 cents, I added them and found they amounted to only 23.95 cents, if my computation is correct.

A. No, they make less than that, 21.95 cents.

Q. 21.95?

A. While the addition—no, add the column to the left, 3.56 cents, 7.27 cents, 10 cents and 9.45 cents and see what that gives. That is 30.28 cents, which I also had at the bottom of page 3007 and then I deducted the 1.19 cents from that and I got 29.09 cents. Then the 29.09 cents is the first column of table 13, aside from station cost after deducting the 1.19 cents for the taxes, I think that was.

Q. Yes, the 1.19 cents was taxes including the interest on the taxes?

A. Yes.

Q. Your present statement makes that ambiguity clear.

A. But I seem a little later to have called it 29.11. I think that was an error in speaking. It should have continued to be 29.09 cents. I think the difference of .02 cents slipped in there somewhere.

3200 Q. Now, if you will direct your attention for a moment to table 13 instead of other expenses "Aside from excluded items, 4.95 cents," which the company actually expended, you put in an arbitrary allowance of 7 cents or 2.45 cents less?

A. Yes.

Q. What would this 9.45 cents or your assumed 7 cents cover in general?

A. All the expenses of meter reading, collection of bills, management of the offices, rental of offices, so far as they were not owned, salaries, legal expenses, insurance, advertising, claims and damages, losses by bad debts, incidental expenses; those are the chief items; there are doubtless some others.

Q. How much would that 2.45 cents which you deduct from 9.45 cents to get your 7 cents amount to in dollars, or somewhere near?

A. About $325,437.52, as I make it, in a rapid computation.

Q. I understand you to take this $325,000 and over from our operating expenses and ask that the price of gas should be reduced so as to eliminate that, on the theory that in Chicago you figure out general expenses to be 5.73 cents?

A. That was the special reason I gave here. There are other companies whose expenses are below yours.

Q. That may well be. There are other companies whose expenses are above ours, are there not?

A. Yes, but there is no company that I think is as advantageously situated as yours is in this country for low distribution cost.

Q. Well, we will see about that a little later. As a matter of fact, the distribution cost with which you started in computing this 5.73 cents related to the Peoples' Company of Chicago, and you started with the figure of 17.234 as their distributing cost, less taxes?

A. Yes.

Q. According to the——

A. No, that included taxes, the 17 cents did.

3201 Q. According to their statement of distribution expense, that is the Peoples' Company's statement, it was nearly 22 cents, wasn't it?

A. Yes.

Q. And you eliminate certain items and bring it down to 17 cents or nearly five cents less, merely because the accountants saw fit to exclude certain items, is that right?

A. Yes, I took their report as correct.

Q. Now, what knowledge have you as to the relative cost of any individual items as between Chicago and New York entering into this 7 cents which you assume and the 9.45 which we expended?

A. The cost of labor is not very different in the two cities and the density of distribution is nearly three times as great per mile of main here.

Q. Have you employed labor in either city?

A. No.

Q. Do you know how the cost of collection compares as between the two cities?

A. No. I got data on labor, I might add. This company gave it.

Q. I know you have got it from one source and another, but it is very difficult, is it not, without knowing what each individual performs, to determine exactly the economy or otherwise of the labor?

A. It will be remembered that Mr. Burr asked for a payroll complete for a month, but I don't think it has been given him.

Q. Well, you have not had the advantage of that in your computation?

A. I had the monthly statement given by the gas company before the State Gas Commission.

Q. You don't know what the cost per thousand for collection of bills is and indexing of meters, in Chicago, as compared with New York?

A. No, the items in Chicago that made up the 5.73 cents or whatever it was, were not given.

Q. You know at some time there was a method in vogue in
Chicago of having bills collected by consumers at the express
3202 company's offices at their own expense for transmission?

A. You suggested a year ago when I was under cross-examination that that was correct, but I have never learned that it was so.

Q. Do you know whether in Chicago the company's bad debts are included in their expenses in the 9.45 cents?

A. I understood it was included.

Q. Do you know how much they amounted to?

A. No.

Q. Do you know what the practice of the Chicago Company is as to charging off bad debts?

A. No. Now that I think of it, I am very sure that the item was included.

Mr. Burr: Which item?

The Witness: Bad debts, but the amount I don't know.

Q. Do you know whether the Chicago Company has any considerable item of rent to pay?

A. That question I don't know. These items of expense were never given to the public.

Q. Do you know whether they rent any bulkheads in Chicago as we have to for our business?

A. No.

Q. Do you know whether they have——

A. They have locations on the Chicago River, but what their relation to it is, I don't know.

Q. Do you know whether they have special inspectors imposed upon them by the city, whose salaries they have to pay in Chicago, as we have to pay them in New York?

Mr. Burr: Inspectors of election or what?

Mr. Mathewson: Inspectors of street works, or how that charge compares in the case of Chicago with New York.

3203 The WITNESS: I don't know the details of the Chicago account, as conditions of secrecy prevailed as to that.

Q. You have read the testimony, if you have read it all, that we have not only inspectors of the city which we have to pay, a large number, but we also have inspectors riding in the subways constantly to detect leaks, etc. There is no like subway in Chicago which has to be cared for by like inspection?

A. No, there is no subway, but the meter readers have to go over three times as much territory to read the same number of thousand feet of gas as here.

Q. Well, you are not prepared then to give any of the details which justify your lopping off $325,000 from our expenses which amount, to 9.45 cents, are you?

A. I argue only from the total there, and what I know from a few other places and my belief, but I think I stated that it was a preliminary estimate that would on that point await the investigation of the accountants.

Q. Well, you had last year before the Gas Commission quite a detailed statement, showing the number of foremen employed, the number of laborers at the different stations and what they were paid, in classes, and the amount of legal expenses that were paid, and the amount paid to the general officers, etc., and I would like to have you point out if you can, which men we are employing in excess of the men we require, and also which ones we are paying too much to, so that we can curtail?

A. That was a statement for December of a certain year, giving the number of men, chiefly, I think, and I believe entirely, connected with one of the stations. I don't think that it was a payroll—it was not a payroll in the first place, and in the second place I don't think it was an analysis of the distribution payroll, but
3204 rather of a station payroll, if I recollect right, a coal gas station payroll, 14th Street or 42d Street.

Q. Well you know that that exhibit which was made up at your request, and a very detailed exhibit, showed the amount payable for attorney's fees and payable for general office salaries and expenses, &c.?

A. I don't remember in detail.

Q. Have you read over the exhibits in the present printed record?

A. Yes. I meant the salary lists by individuals.

Q. But did you observe anything there which you can put your finger on and say that is not a proper expenditure?

A. I have not had a sufficiently full opportunity or sufficiently full exhibit before me to be able to tell that.

Q. Let us take the figures of these accountants to which you have referred in Chicago. Did these accountants have any practical knowledge of the gas business?

A. I know they have examined gas companies before. Just how much knowledge, I would not undertake to testify.

Q. Do you know whether they have any practical knowledge of the gas business?

A. I don't know.

Mr. Burr: Do you refer to Marwick, Mitchell & Company?

Mr. Mathewson: Yes.

Mr. Burr: The same accountants that are now examining your books on behalf of the defendants?

Mr. Mathewson: I don't know anything about that, I know there are thirty or forty men up there.

Q. Now you know, don't you, from this report of the Committee of the Common Council in Chicago, that these accountants were merely appointed "to verify the figures as presented by Mr.
3205 Meagher" on account of the gas companies, and not to make any deductions of their own at all because they were not gas men?

Mr. Burr: Is that the quotation?

Mr. Mathewson: I ended the quotation.

Q. And on the further understanding that "such accountant should treat as confidential the figures of the Company thus disclosed to him."

A. What part of the page are you reading from?

Q. Second column about half way down. I will read the whole of it if you wish: "Mr. Meagher, representing the Peoples' Company consented to have the Committee select a chartered accountant to verify the figures of the Company, and this arrangement was made with the understanding that because of pending litigation such accountants should treat as confidential the figures of the Company as thus disclosed to him, the purpose of this examination being only to verify the figures as presented by Mr. Meagher." That appears to be the statement in the report, doesn't it?

A. Yes, I had read that before. I remember it.

Q. And you understand further that these accountants, in spite of that, proceeded to present certain deductions which they were not asked by the Committee to make at all?

A. No, I don't understand that they did anything which they were not asked to do. I understood they were not to give the details of the items of distribution.

Q. You did not know then that they were appointed only to verify the figures as presented by Mr. Meagher?

A. Certainly, and they did not verify them, as they could not; they found they were wrong.

Mr. Mathewson: I move to strike that out.

3206 Mr. Burr: I object to its being stricken out.

The Master: Let it stand.

Mr. Mathewson: Exception.

Q. How do you know they were wrong?

A. I have their word for it in the report.

Q. Have you examined the books?

A. No.

Q. You have the word of the officers of the Company that the figures were right. How do you know that those figures are wrong as given by the Company and that the figures as presented by the accountants are right, so far as they include the proper charges to the operating cost of gas?

A. Why, I know that this was the report of the accountants——

Q. Yes, but do you know that that is right for any other reason except that they made it?

A. I put it on the basis of the accountants having said so.

Q. You said you knew. Have you examined the books?

A. No. I do not find in any further publications of the Council or in any other place where I have read it that this report of Marwick, Mitchell & Company was followed by any disproof of their report.

Q. Merely a question of what should be charged to the operating cost of gas, and I think I can show you a little later from the conclusions of the Committee themselves that they did not accept those figures, certainly as complete. Now will you look at page 40 of this same pamphlet and see whether over the signature of Marwick Mitchell & Company, does not appear this statement, second column at the bottom; in relation to the figures which they presented and which you have quoted: "No allowance is however included in their statement for that wear and tear which is usually conceded to occur in excess of that which is covered by renewals."

A. Certainly.

3207 Q. So that their account on its face does not purport to show the proper amount which should be allowed to the Company for the cost of gas, does it?

A. It does not give the renewal and contingent account, neither did I include that in the seven cents which I took.

Q. That is all right, but I am reading the figures that have been quoted here as the cost of gas in Chicago to show that they did not include all the charges which must be made to the cost of gas.

A. But in their next letter, in the next column they state to the City Council, to the Chairman:

"Replying to your communication of even date, I wish to advise you that there is 6.0043 cents per thousand feet included in the figures for renewals and repairs in the year 1904 and included in the figures in the distribution of gas as shown by the Peoples' Gas Light & Coke Company in our report. Yours truly, Marwick, Mitchell & Co."

Q. You find, too, later that the City Council allowed four cents beyond that for repairs, don't you?

A. They allowed something. I don't remember the figures.

Q. We will therefore stop that for a moment and go back to another suggestion of yours. You say that the distribution charge ought to be small in the City of New York or smaller because the consumption is greater.

A. Per mile.

Q. Per mile. Does it not appear in Chicago the Ogden Gas Company's density of consumption on their mains was greater, nearly twice as great as the density on the Peoples' mains, and yet that the cost of distribution to the Ogden Company was greater than the distribution to the Peoples' Company?

A. I don't remember about any figures on the density of distribution of the Ogden Company. They may have been given. I have no knowledge either that the accountants investigated the Ogden Company. I have never found a report about it. 3208

Q. Was not that called to your attention when you testified in the Chicago Investigation as rebutting your theory that the greater the density of consumption the less the cost of distribution?

A. Will you call my attention to it? I don't remember it.

Q. I think I can. Was it not also called to your attention before the Gas Commission here in the Consolidated Gas Company's case?

A. It may have been. I don't recall at the moment. But the return as I have it here of the Ogden Company's total costs was 47.67 cents of which 27.86 cents were nominal manufacturing costs——

Q. You do not need to do that, because I have the testimony right here and I think I can save you the computation.

A. If I can just finish this a moment. That left 20.81 cents as the distribution cost returned by the Ogden Company.

Q. 22.81 is it not? You had added 2 cents to the Ogden Company in order to make up a difference in candle-power, had you not, in order to get that 26 cents, whereas it is 24.86 cents before you added those 2 cents, is not that right?

A. Possibly. I don't remember.

Q. Don't you remember you added those two cents?

A. Possibly, but I think however that came in another connection.

Q. I don't think so.

A. I think 26.86 cents was their return, but 2 cents was only a bookkeeping charge.

Q. I have it right here in your testimony, page 1310:

"Mr. DeFord: Yes, go ahead and make any explanation you desire. A. The statement that I am objecting to is this, that I must compute on the basis of adding this 5.18 cents to the cost of the Consolidated Gas for the same candle-power at the burner, which is 24.86 cents." 3209

Q. Don't you remember that it was 24.86 cents for the Ogden?

A. That is what I insisted was the cost to the Ogden, but they had made their return as 26.86 and afterwards their president had admitted to me that 2 cents was only a bookkeeping charge.

Q. To equalize the cost to the Peoples Company?

A. No, that came up later.

Q. Well, let me read from page 1312 of the testimony before the Gas Commission. I asked the question as follows:

"In Chicago can you tell me what the Peoples' Gas Company's distribution was or the rate per thousand? A. 21.71 cents.

"Q. Do you know what the distribution of the Ogden was? A. 22.81, or more than a cent greater.

"Q. You stated the other day that density had a great deal to do with the cost of distribution. A. The density of population.

"Q. Or consumption? A. Yes.

"Q. Did it not appear in Chicago that the density of the Ogden Company's consumption was about double the Peoples' although its output was only a fraction? A. I don't think that was brought out while I was there. I don't know what has happened since."

Q. You did testify however that high density did not always give a cheaper distribution?

A. Other conditions affecting.

3210 "Q. (Reading:) Alderman Potter: Yes, but Ogden, has it anything in density of consumption? Professor Bemis: 'Yes.' A. I had forgotten that. Now, what was the density in Chicago?"

Q. Your reply was that you had forgotten it, and you see that Alderman Potter called your attention to the density there of consumption being twice as great.

A. I don't recollect even now how many miles they have or what their consumption is in the Ogden.

Mr. Burr: Do you mean how many miles of the 2,000 miles of mains?

The Witness: That was another Company, the Peoples' Company was 2,000, and they sold eleven billion feet. I don't remember about the Ogden mileage. I don't think I have any data about it.

Q. As a matter of fact the Ogden Company's sales were only about one billion feet?

A. I think that was their sales, but I don't remember their mileage.

Q. And their consumption it appears was nearly double in density per mile of main to the consumption of the Peoples', and yet it appears that the Ogden with that greater density of consumption had a distribution cost greater than the Peoples' doesn't it?

A. Well, I cannot discuss it much without having more of the evidence before me.

Q. But I have read your own evidence before the Gas Commission.

A. I should want to go through the whole case.

Q. If that evidence is correct——

A. I never did know a great deal about the Ogden Company. It did not go into evidence, and I never visited their plant and the accountants never examined their books, so far as I can learn.

3211 Q. What is your final answer, are you prepared to say now or are you not prepared to say that the Ogden Company's distribution was greater than the Peoples' Company according to the information you have?

A. At the present time I don't recall, but if you say that I at one time testified differently, probably it would be acceptable. I will accept it, that you read it correctly, but the facts about the Ogden I don't know. The Ogden Company may have been distributing only in a specially favored district in the city. I have never looked into their situation.

Q. It appears in the testimony here before this tribunal that the Consolidated Gas Company has mains in every street in this City that has been opened, the outskirts as well as the heavily populated sections.

A. But taking that all into account it sells three times as much as the Ogden; certainly the Peoples' Company, and I think, as the Ogden.

Q. But that proposition would seem to be proven from the Ogden and Peoples' Companies that density of population only does not mean a lower distributing cost?

A. Not unless you know the circumstances attending the Ogden Company, and I don't know just where it sells its gas. It may sell to the Peoples' Company for all I know. A lot of the Companies do.

Q. If these figures you gave before the Gas Commission were correct, they would tend to show that density of consumption alone does not necessarily mean a lower distributing cost per thousand?

A. There may be other——

Q. Of course, but can't you answer that question?

A. It has the same tendency, just as the lowering of price has the tendency to increase sales, but there may be counteracting forces——

Q. (Question repeated). Can't you answer that directly?

A. Not necessarily, if other conditions are not fairly equal.

3212 By Mr. Burr:

Q. And those conditions in that case are not known to you?

A. And the conditions in the Ogden Company are not known to me at all.

By Mr. Mathewson:

Q. Don't you remember that the accountants in Chicago stated that they had not examined several of the distributing or other accounts bearing directly on the investigation as to the cost of manufacture or the distribution in Chicago?

A. Yes, but the inference they drew was that the cost would be still further modified.

Q. Well, we may draw inferences, but the point is that they did not have any definite information from which they made their report and they had not examined certain accounts?

A. No.

Mr. Burr: You are calling attention to what they claimed?

The Witness: This is what they wrote on page 40: "Had we had access to these accounts, the cost of manufacturing and distribution might have been somewhat further modified."

Q. It does not say whether up or down, does it?

A. No. I know what they think, though.

Q. I don't think such facts are very material, when you come to cut off $325,000 which we have made, as improper. Do you remember what you testified that the distributing cost in New York was, acual expenditures? *A.* In 1905, ending October 31, 1905?

A. Probably I took Exhibit 93. At that time I took their exhibit as it was.

Q. Well, you made certain deductions in order to make comparisons with Boston and other cities and you found that

3213 & 3214 the items you had left and which you called distributing expenses amounted to 16.24 cents, didn't you?

A. I don't have the figures in mind but if you say I did, I will accept it.

Q. Well, I will let you see.

A. That must have included some items not in this. Very likely it included repairs or taxes.

At 4.10 P. M. adjourned to October 23, 1906, at 10.30 A. M.

3215 Circuit Court of the United States. Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, TUESDAY, *October* 23, 1906—12 m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr and Mr. Kirby.

3216 Continuation of the cross-examination of EDWARD W. BEMIS.

By Mr. MATHEWSON:

Q. We were referring yesterday to the cost of distribution and the effect thereon of density of consumption and——

A. I have never meant to imply that density was the only important element; size of the company is an important element. Density affects the expense of meter reading and many things of that kind; the size of the company affects the salary list per thousand feet.

Q. What do you mean by the size of the company, the output in thousand feet?

A. The number of feet of sales.

Q. We found yesterday that the Ogden Company, operating in Chicago, had a higher distribution rate than the People's Company although the density of consumption in the Ogden was about double that of the People's.

A. May I read my testimony on that in the Chicago case verbatim, which I have here?

Q. I don't think it is necessary to.

A. Well, I dispute the fact, then, that there was any practical difference between the distribution costs of the two companies.

Q. Very good; supposing you assume them to be the same, that is not very material to my point. The density of the consumption of the Ogden Company appears, so far as it appears at all, to have been about double the density of the People's, and yet the distribution expenses of the Ogden Company per thousand feet appears to have been no less than that of the People's.

A. I am not prepared to admit that there was any such difference as double density. I have here the last report of Brown's Directory, which shows a different result.

Q. Well, I don't think very much of that for an authority,
3217 but does not the evidence in Chicago show that the density
of consumption in the Ogden Company was greater than in the People's?

A. A little greater, but not double.

Q. Is it not stated in the evidence that it was double?

A. I am not aware of it. If you will show me the evidence I will look at it.

Q. Well, that is my recollection of it.

A. I haven't any such recollection.

Q. Now, we will take your other proposition, that the greater the company the smaller the cost of distribution. Now, it appears that the output of the Ogden Company, as you stated yesterday, was about 1,000,000,000 per annum, and the People's Company was about 11,000,000,000 cubic feet per annum, and yet you say that the cost of distribution was substantially the same.

A. Not as found by the accountants.

Q. Well, the accountants did not find out anything about the Ogden Company, did they?

A. No, they did not look at that, but they did the other.

Q. Well, the statement as presented by the People's Company and the Ogden Company showed, so far as their figures were concerned, that the Ogden distribution was about 22.81 and the People's distribution about 21.71 cents, didn't they?

A. The distribution cost of the People's Company as claimed by them was 21.71 cents.

Q. And the Ogden was what?

A. 22.81 cents, but the taxes of the Ogden are a little higher, so the taxes being eliminated I testified the costs in each is about the same.

Q. Precisely?

A. That is the cost as reported.

Q. Well, but that is the only basis upon which you can make any comparison, is it not, because you did not examine the Ogden figures?

A. That is right, so far as the Ogden is concerned.

Q. Well, that is the only basis of comparison that you
3218 have, that is, the reports of the two companies, is it not?

A. The fact that the accountants were able to make and did make or find great reduction in the cost of distribution in the case of the People's Company does not seem to establish the probability that they would have done so in the Ogden, because experience throughout this country and Europe tends to establish the fact that the large company has lower costs, and I am not prepared to admit that it is even probable that an examination of the Ogden by Marwick, Mitchell & Company would have shown a different result.

Q. Well, so far as the reports of the companies were concerned, which was what you were dealing with in your testimony before the Gas Commission, it appears that the Ogden distribution was certainly as much in cents per thousand as the People's?

A. Just about the same.

Q. Yes, and the Ogden, on the other hand, had an output of 1,000,000-cubic feet per annum, as against 11,000,000-cubic feet per annum by the People's?

A. Yes, but——

Q. That would not indicate, then, would it, that great output was necessarily going to make a smaller distribution cost per thousand feet of sales?

A. But such absolute discredit has been thrown on the report- of the People's Company that you cannot place any credit on them.

Q. You are referring to the accountants?

A. I am.

Q. Don't you think that accountants who are not acquainted with the business are quite fallible?

A. All people are fallible.

Q. You dwell so much on these accountants' figures, that I want to inquire whether the Water Works Company at Cleveland of which you are superintendent hasn't been examined and investigated recently?

A. Yes, at my request.

3219 Q. At your request?

A. Well, by Marwick, Mitchell & Company, or others; which do you mean?

Q. I do not say by Marwick and Mitchell. I say they have been examined.

A. Yes.

Q. And an expert accountant was appointed to go over the books, wasn't he?

Mr. Burr: I object to this as incompetent, irrelevant and immaterial. I do not see what this is leading us to.

Mr. Mathewson: You will in a minute.

Mr. Burr: Before you go further, I want to know what you are going to lead us to. What is the object of the examination of this witness as to an examination of the water works in Cleveland?

The Master: It seems to me that is proper cross-examination. He has based a lot of statements here on figures of expert accountants, and I do not know but what Mr. Mathewson may be going to show that at some other time the said expert accountants were no good.

Mr. Mathewson: That is about it.

The Master: I cannot tell at this stage.

The Witness: I would like to have him go on, really.

Mr. Burr: I withdraw the objection.

Q. (Question repeated.)

A. Yes.

Q. I refer to the expert accountant who was appointed by the committee of the City Council, wasn't he?

A. Yes.

Q. And he hadn't any great familiarity with the water business, had he?

A. No.

Q. And he made certain recommendations with reference to the character of your accounts?

A. Yes.

3220 Q. And so on, which you now declare were fully unjustified?

A. Yes, the committee discharged him in disgust.

Q. And then they got another one?

A. Yes.

Q. And this other one made an examination?

A. Yes.

Q. And the result was that they found there that the accounts were not in the proper shape, and that they could not figure out expenses and receipts, etc.?

A. That is not the report of the accountant, no.

Q. I am talking about the committee.

A. The committee of two members of the opposite party, who were trying—who had a particular axe to grind——

Q. But the point is that the report——

Mr. Burr: I object, because this is entirely and plainly immaterial and has no bearing upon the facts in this case. I object to it as incompetent, irrelevant and immaterial.

The Master: Objection overruled.

Mr. Burr: Exception.

Q. Now, Professor, your conclusions were, and you strenuously maintained, didn't you, that the findings of the accountant, so far as he found anything, and of the City Council, they not being acquainted with the water business, were misleading and incorrect?

A. No, that is not a correct statement.

Q. What is the correct statement?

A. The correct statement is that there were two accountants at different times. The first was discharged by the committee in disgust. He had been employed by the electric light company, which had an especial grievance against the city, and they were afraid of the question of municipal ownership, and he was working for them and was employed by the committee. When they found that out they discharged him. The second accountant I found no 3221 fault with, and neither have I found any fault with his report. The committee of the City Council, composed of three members, has made a report, two members have made a report, composed of Republicans who had special reasons for fighting Mr. Johnson, and there is a minority report just going into the Council.

Mr. Burr: What Johnson?

The WITNESS: Mayor Johnson of Cleveland; and the whole matter has been referred to the Judiciary Committee of the City Council, which has the matter under discussion now, and I am prepared to discuss the points raised, if you wish, by the committee, but I have made no report antagonistic to the findings of the second expert bookkeeper; in fact, his report was favorable to the water works, I may add.

Q. Who was the second bookkeeper?

A. Mr. Williams.

Q. You find fault, then, with the conclusions of the committee who appointed the expert, made after the expert had reported, and not the expert himself?

A. That is right.

Q. And your conclusion is that the report of the committee, the findings of the committee, in that case, not being acquainted with the water business, were unjustified and improper?

A. Absolutely, and prejudiced to the greatest extent.

Q. Now, let me ask you about these so-called expert accountants of Chicago. Did they give any testimony in that proceeding at all?

A. All I have seen are two letters.

Q. You know, don't you, that they never appeared, and were not subjected to cross-examination?

A. They were ready to appear, I understand.

Mr. MATHEWSON: I move to strike that out.

Mr. BURR: No, I think that is——

3222 Q. I asked you if they appeared and were subjected to cross-examination?

A. I only know what appears by the evidence.

Q. Do you know whether they appeared and were subjected to cross-examination or not?

A. I am informed, on what I believe to be good authority, that a member of the City Council offered to have the entire report taken up by items with Marwick and Mitchell and the bookkeepers of the company present, and it was not accepted by the company.

Q. You get that information. Do you know anything about it yourself?

A. I was not present.

Q. You do not find any evidence there, do you, of these accountants in Chicago at all except that from statements that are in that pamphlet to which we have been referring?

A. I have been informed on this fact by the accountants.

Mr. MATHEWSON: Will you read the question, please?

(Question read by stenographer.)

The WITNESS: I find no official evidence save that.

Q. You read the testimony of Mr. Marks in which he said it was impossible for accountants who were not practically acquainted with the gas business to examine records and make a proper deduction?

Mr. BURR: Adding, unless they were guided by competent engineers. That is what Dr. Marks said.

A. I don't remember his testimony sufficiently to quote it, but I think it was along that line, in somewhat of a general way.

Q. Well, we will proceed on this subject, of cost of distribution and size of cities. It appears, does it not, according to my last question of yesterday, that your testimony as to distribution 3223 in New York for the nominal year ending October 31st, 1905, excluding taxes for comparison, was 16.94 cents?

A. I don't remember now what the 16.94 referred to.

Q. Don't you remember what that referred to?

A. No, I have not had time, I have been so busy with this testimony, to go over my testimony in that case. I know there was a figure 16.94 cents, but just what it included and what it excluded I don't now quite recall.

Q. Well, you remember comparisons were made between that figure and the distribution cost in Boston, don't you?

A. Yes, sir.

Q. Perhaps I can refresh your recollection?

A. My impression is that I took the figures of the company, of the Consolidated Company, in my testimony last spring.

Q. Oh, yes, I am assuming that you took the statement Exhibit 93 or its equivalent?

A. Yes.

Q. And from the information you then had before you you did not question the propriety of the expenditure for any one of the items that appeared on that exhibit, did you?

A. I don't think I gave a complete bill of credit to the company, but I did not—I think I took the ground that I had not data at hand sufficient to dispute it, save that I did refer to the fact that distribution costs were lower in some other places. I am positive I did that. And in that way I threw discredit on their report, but I made computations based on their reports.

Q. Well, now, I am going to read from your testimony before the Gas Commission and see if I can refresh your recollection. Page 1331:

"Q. Now, returning to the subject of distribution, it appeared at the last session that while the output of the People's Gas Company in Chicago was much greater than the output of the Ogden Company, the distribution charge of the People's Gas Company was 3224 greater than the distribution charge of the Ogden, which rebutted your theory that the greater the distribution the smaller ought to be the distribution expense? A. Yes.

"Q. And it also appeared that although the Ogden density per mile of main was double the People's, yet the Ogden's cost of distribution was greater than the People's, which also rebutted the theory that the expense of distribution depended on density. Now it also appeared that the cost in Boston of distribution was 18.76 cents, as against 16.94 cents in New York, or nearly two cents greater. That is correct, is it? A. I think those figures are correct.

By Chairman **Gunnison**:

"Q. Do you want to verify these figures? A. The evidence has been given on that in a previous volume, but I don't think they are wrong."

Mr. Burr: There is some more in that statement which you have not read.

Q. "There are often exceptional conditions." Now is that a proper quotation, is it an exact quotation from the testimony before the Gas Commission?

A. That is an excellent illustration——

Q. I must ask you to answer my question. You are not going to sum up this case. Your counsel can get such facts as he wants. I am asking you a simple question, whether that is an accurate quotation from your testimony before the Gas Commission, so far as it goes?

A. Yes, but it was not an accurate reply when made, and should not have been made.

Q. That is another proposition. There may be others?

A. Yes. I think I said altogether too much on cross-examination. I have discovered that. May I testify wherein I think I was inaccurate in my reply there? 3225

Mr. Mathewson: Well, Professor, I think really we will get through much quicker if you will let me ask my questions, you answer them, and then make any further explanations that you wish, on redirect, because it interferes with my line and does not do you any good.

The Witness: All right, sir.

Q. Now you say that your statement was inaccurate?

A. Yes.

Q. Is it not the fact that the distribution expense in Boston, deducting taxes, you computed to be 18.76 cents?

A. That may have been. My amount referred to another portion of the paragraph.

Q. Well, is it?

The Master: Cannot you answer these questions directly? We lose a lot of time getting a direct answer.

Q. Isn't it a fact that the distribution cost you computed to be in Boston 18.76 cents after deduction for taxes?

A. If it says so there, I must admit it.

Q. Doesn't it say so there?

A. Well, you read it.

Q. Don't take my word for it. I might not be reliable (handing book to witness).

A. It says 18.76 in Boston; 16.94 in New York.

Q. And you were asked then if you wanted to verify these figures, and you said that you did not think they were wrong at that time.

A. The question referred to the whole paragraph.

Q. (Reading.) "Do you want to verify those figures?" Now, the only figures in that paragraph are 18.76 for Boston and 16.94 for New York? Aren't they the only figures in that question at all? 3226

A. No.

Q. What?

A. No.

Q. What other figures?

A. That the density of the population per mile of main was double that of the People's Company.

Q. I will leave that out, I am not referring to that. I am referring to the cost of distribution in Boston and New York; those figures. The Chairman asked you if you wanted to verify those figures, did he not, and you replied, "I don't think they are wrong"?

A. Yes.

Q. Now let us proceed a step further. The distribution being 18.76 cents in Boston—that is the largest city in Massachusetts by far, is it not?

A. Yes.

Q. And according to your theory the distribution expense should be smaller than it is, in small cities. Let us see whether that is so or not. You referred in your testimony before the Gas Commission to the distribution expense in the seven next largest cities in the State to Boston, being Lowell, Lynn, Fall River, Cambridge, Worcester, Springfield and Lawrence, did you not, at page 2178 of the printed record before the Gas Commission?

A. Yes.

Q. Now, those are the same cities, or many of them are the same cities, which you and Professor Marks have been dealing with on this hearing?

A. Yes.

Q. Will you tell me what the distribution expense appears to be in those cities, less taxes, to compare it with Boston?

A. 17.03.

Q. In other words, those seven smaller cities show a lower distribution cost per thousand feet than Boston, which is 18.76 cents, do they not?

A. This is according to Exhibit 161, page 2178 of the printed testimony.

3227 Q. Have you any doubt about it?

A. I have not at present.

Q. Didn't you, in fact, before the Gas Commission testify that the distribution cost of these seven cities was 16.01 cents per thousand feet, and were you not corrected by this exhibit which was shown you?

A. I think so. I know I testified they were lower.

Q. So that would not tend to prove your theory that the larger the city and the larger the output, the smaller the distribution expense per thousand feet?

A. That particular fact would not, no.

Q. Isn't it a fact that the companies operating in great cities like New York and Boston are subjected to a great many impositions in the way of expensive pavements in the case of repairs, and metropolitan exactions of one kind or another, such as inspections, abatement of nuisances and other things which increase or tend to increase the expense of delivering gas?

A. Certain items of that kind do tend to increase it.

Q. And it would appear in this case, would it not, that Boston, in spite of having a much greater output, had a distribution expense greater than the small cities, due, perhaps, to these additional burdens that it had to bear which the smaller cities did not?

A. When you say perhaps due to that cause, I do not assent without further explanation, but that it was right as to the small cities I agree.

Q. In other words, it would appear from this, would it not, that certain cities of sufficient size to have what you might call a wholesale output and were not of sufficient size to be subjected to these metropolitan exactions, might have and do have a smaller cost of distribution per thousand feet than a greater metropolitan city which has a larger output.

3228 Objected to as assuming something. The Professor has not conceded these metropolitan exactions.

Mr. MATHEWSON: He said that there were, just a moment ago.

Mr. BURR: He said, "perhaps."

Mr. MATHEWSON: No, that was something else.

The WITNESS: In the case of Boston, I said "perhaps" as compared with the other Massachusetts cities. I did not say on that that I knew that.

Q. And your answer would be "yes," would it, to my question?

A. I answered that in some cases that was true.

Q. And in these cases it would be true?

A. But as to Boston as compared with the other Massachusetts cities, I said I was not prepared at the present time to analyze the difference in the cost of distribution.

Q. No, but you have testified in Boston during that time, have you not?

A. Yes. In one case.

Q. And you have made a very careful analysis of the Boston cost of distribution and also a very careful consideration of these other seven cities for the express purpose of testifying before the Gas Commission on the relative cost of distribution?

A. I remember in a general way that salaries in Boston were exorbitant as compared with these other cities, and that was the chief reason for the difference, but I am not prepared now to present a table, as I can in twenty-four hours, giving the exact difference and where it lies.

Q. I don't care where the exact difference lies. I would like the general rule. Isn't it true as a general rule that the salaries are higher in a great city like Boston or New York than they are
3229 in a small community?

A. They are likely to be, but Boston was then composed of six—really seven—companies which maintained, to a certain extent, an independent organization, not fully, but in considerable measure; and there were expenses there which do not exist in the case of the Consolidated, which has been consolidated for twenty years. That company effected a consolidation after my testimony. There had been a partial consolidation previously, but it had not been fully carried out; and even now, I do not think, has been completely carried out, as far as the reduction of expenses is concerned.

Mr. MATHEWSON: Will the Stenographer please read the question?

The STENOGRAPHER (reading): Isn't it true as a general rule that the salaries and wages are higher in a great city like Boston or New York than they are in a small community?

A. Absolutely yes; per thousand feet, salaries would be lower in a big city.

Mr. MATHEWSON: I move to strike out, "per thousand feet, salaries would be lower in a big city."

The MASTER: Strike it out.

Mr. BURR: I except.

Q. Now, isn't it true that the physical conditions in Boston are more nearly similar to those in New York than those on any other great city that you can mention?

A. I don't think they are any more like New York than is Chicago, nor so much.

Q. You don't think so?

A. No, because at that time Boston was not one company while Chicago was—that is the People's was one company, in a complete sense.

3230 By Mr. BURR:

Q. How about Philadelphia?

A. (No answer.)

By Mr. MATHEWSON:

Q. I am talking about physical conditions?

A. Excuse me. I thought you were talking about the general considerations.

Q. I said physical conditions. Now, won't you answer the question?

A. I still think there is no great difference in the physical conditions in the three cities, save that Chicago is nearer in population to New York than is Boston. I should say Chicago was nearer in physical conditions to New York than is Boston.

Q. Has Chicago any rock to deal with in laying their distribution system?

A. No. That affects the cost of construction.

Q. How about Boston and New York?

A. As affects the cost of operation—I don't think Boston has much rock. According to my recollection of the testimony neither Boston nor Chicago has much rock.

Q. Do you mean to say that Boston has not much rock?

A. I don't recall—and I have read all the testimony in the Boston case, that there was evidence of any considerable amount of rock in connection with street mains. The whole Back Bay District I remember is a filled-in district.

Q. Is Chicago flat?

A. Yes.

Q. How about New York and Boston? They have substantial elevations, each of them, haven't they?

A. Yes.

Q. Boston and New York are both very much older cities than Chicago, are they not?

A. Yes.

Q. They both have many old and narrow streets, with congested traffic therein, haven't they?

A. Yes.

3231 Q. Are not the streets of Chicago laid out on a much broader scale and more modern, less winding, than the streets of either New York or Boston?

A. Yes.

Q. Let me read from your testimony at page 1322 before the Gas Commission:

"Q. You finally took up the city of Boston. Didn't you say in the " Boston investigation that the conditions in Boston and New York " were more nearly alike than perhaps in other cities you could " mention in reference to their distribution system? A. Boston, " next to New York, has, I think, a dense population, but nothing " like it. It is only a third as condensed as New York, but it per- " haps comes nearer to New York than most other cities.

"Q. As a matter of fact, both New York and Boston have many " old, narrow streets? A. Yes.

"Q. Each of them has a subway to deal with, so far as that affects " conditions at all? A. Yes.

"Q. And each of them has a great deal of rock haven't they? A. " Yes."

Now, do you mean to say now that Boston has not a great deal of rock? A. My recollection is I was wrong in saying a great deal of rock in Boston.

Q. That is another case where you were wrong? Is there anything further in those answers that was wrong?

A. I believe on further investigation of the case that in some respects Boston is nearer like New York than in some respects Chicago. When you come to balance the two I will say that in the matter of size, in the matter of maintaining street mains on account of electrolysis, in the expense of wages and of labor, Chicago is nearer like New York than is Boston. Also in the fact that 3232 Chicago makes almost entirely water gas, while Boston has only about one-third water gas, is again a reason why Chicago is nearer like New York than is Boston. On the other hand, as has been just mentioned, Boston is an older city and in that respect nearer like New York than is Chicago; and the streets are narrower than Chicago, and there may be, probably is, more rock proportionately in Boston than in Chicago, but I don't recall now the percentage.

Q. Let me continue to read:

"Q. And each of them has a very condensed population in certain parts of the City? A. Yes. I do not think the density is anything like as great in Boston.

"Q. But you said the distribution cost in Boston was 18.76 cents, as against 16.94 cents in New York. In other words, Boston is nearly 2 cents per thousand greater in distribution than New York, upon the most favorable basis for New York? A. Yes.

"Q. Is not the re-location of the pipes there very expensive, where there is such a congestion of traffic? A. Yes.

"Q. Do you know what the legal regulations of New York are in reference to permitting us to open the streets and allowing long trenches to remain open? A. I have not looked that up.

"Q. Do you know what the condition is in the streets of New York as to sub-surface work, the amount of pipes, and whether there is room for extra pipe, and how deep we can lay pipes?

A. I know it is greatly congested here, because I have seen men working in them.

"Q. Do you know that if sometimes takes our gang as much as a week to get our pipes around a single corner on account of the subway traffic? 3233

A. That subway involves heavy repairs."

Is that all correct?

A. That is correct, yes.

Q. On page 1324:

"Q. Can you think of any other city which, in its change of conditions as to pipes, comes as near New York, we will say, as Boston, as to location in the East and general conditions? A. No, I don't know that I can.

A. In the East, you say?

Q. Do I quote that right: "As to location in the East and general conditions"—not in the city—in the East?

A. Let me see that once more.

Counsel hands book to witness.

The WITNESS: No, I don't know that I can. I undoubtedly said that.

Q. Now, when you speak of Western cities and you come to operation, you know that gas coal, and you know that the oil, is very much cheaper in the West than it is here in the East, New York or Boston, don't you?

A. Oil is cheaper in the West; that is, as far west as Chicago. It is cheaper than here.

Q. Don't you know that the gas coal is in the making of coal gas very much cheaper in Ohio, for instance, than it is in New York?

A. I am not sure about Chicago. I think coal in Chicago may be—I have not the exact figures, but I think gas coal in Chicago may be quite as expensive as in New York.

Q. Do you know whether it is or not?

A. I never got absolute data, but the anthracite coal goes further—

Q. They don't make coal gas in Chicago, do they?

3234 A. In making water gas they use anthracite coal and coke.

Q. Under the boilers?

A. In the generators.

Q. When I refer to gas coal you know that I mean coal which is used to produce coal gas, do you not?

A. Oh, excuse me. I was not for the moment noticing what you said, and I thought you said any coal that might be used in making gas.

Q. I refer to gas coal.

A. Of course they don't make any coal gas in Chicago, so if I had noticed what you said I would have said there was no gas coal such as you refer to used in Chicago. To be accurate, I must say there was none at the time I was testifying there. I have since understood there is a coke oven plant being put in there which will undoubtedly use gas coal.

Q. Now, the figure of 64.23 which we procured at page 3193 of the testimony yesterday, including 3 cents allowance for reserve, did not include, did it, any allowance for the additional candle-power required of the Consolidated under the recent act raising the standard from 20 to 22 candle-power? It was merely for the period, as I understand it, for which you were computing, that is, the calendar year 1905?

A. It was either the calendar year or the year ending October 31st, I have forgotten which now.

Q. That was the calendar year which you were dealing with there certainly, with 74.81 cents?

A. Oh, yes. Well, that did include then——

Q. It included six months of the new law?

A. Yes.

Q. Now, the Gas Commission, as you have read no doubt, taking the nominal year ending October 31st, 1905, which included four months of the new 22 candle-power, made an addition of 1.81 cents to their computation in order to cover the new candle-power. On that ratio how much would be added for the six months?

3235 A. Well, that is purely a mathematical computation.

Q. Well, make some estimate of your own, roughly?

A. On that basis it would be 2.7 cents.

Q. Oh, no, that could not be, because there was only 1.81 they added to the cost for the nominal year to represent the cost for 1906, we will say, due to the additional two candle power.

A. Why, if for four months the extra cost is 1.81 cents, then for six months it would be six-fourths of it. That was what I was doing.

Q. You misunderstand. The Gas Commission found 60.75 cents as the cost for the nominal year ending October 31st. They said that as only four months of that year were under the 22 candle-power law, they would add to the 60.75 cents 1.81 cents, making 62.56 cents.

Mr. Mathewson: That appears in the opinion of the Gas Commission attached to the papers.

Mr. Burr: That was excluded, I understand.

Mr. Mathewson: Oh, no. It is expressly admitted by the City in their answer.

Q. Now, the period which you have taken, the calendar year, included six months of the 22 candle-power?

A. Exhibit 94 takes six months, yes.

Q. Now, what amount should be added to the 64.23 which we have if we wanted to represent a subsequent period dealing only with 22 candle-power?

A. Oh, if you want to take the twelve months' period?

Q. Yes. It would be about one cent and a half, wouldn't it?

A. Why, on that basis of reasoning, if it took for four months 1.81 you want to know what it would take for twelve months?

Q. No.

3236 A. It took 1.81 for increase for four months, what would it take for twelve months, isn't that your question?

Mr. MATHEWSON: Will the Stenographer read the record?

The Stenographer now reads the record down to the end, starting with the question, "You misunderstand me. The Gas Commission found 60.75 cents as the cost," etc.

Q. You would have less than 1.81 in that case, because you would have six months of that 22 candle power in that period, whereas the Gas Commission had only four months of the 22 candle power in their period?

A. Yes.

Q. Well it would be roughly upon that basis one cent and a half?

A. Well, I will assume that without stopping to figure it out.

Q. Or one quarter— I don't know, it is something around there, isn't it?

A. Very likely.

Q. And whatever it is, that is not included in the 64.23 cents which we were computing yesterday, is it?

A. No.

Q. Now, furthermore, it appears in the evidence that for the year 1906 there have been assessed against the constituent companies which formed the Consolidated additional taxes which never have appeared before and that the special franchise tax or assessment has been increased $4,600,000, and that the increase in taxes from those two items alone would be 1.13 cents, if they are maintained. That amount has not been included either so far, has it?

A. No.

Q. Did you find that quotation in your testimony before the Gas Commission to which I referred you where you said that miscellaneous income or stove rent which formed the greater part of

3237 it might perhaps as well be added to income?

A. I did not look for it.

Q. You are willing to accept my word, as far as that goes?

A. If you say it is there I believe it.

Q. I think so. That is my quotation. I suggest you look it up if you have any doubt about it?

A. I should have said offhand that I deducted miscellaneous income.

Q. You did in your final computation, Professor, but that was some time subsequent to the statement to which I called attention, that perhaps it might as well be added to income. You stated in another place that was open for argument. Those are your exact words I think you will find.

Now I take up with you the subject of this reserve to see whether your theory is correct or not. It appears that of the twenty-two past years the first eleven years show an average of repairs and renewals of 12.25 cents, according to your testimony, and the second eleven years an average of 9.73 cents. Now as a matter of fact the Company began purchasing gas in 1900 and it is in evidence that for the last five years prior thereto, being the last five years within which the Company manufactured all the gas which it sold, the average repairs were 12.31 cents per thousand. Have you taken into consideration the fact that since the Company has been procuring gas from other companies, that is since 1900, there were certain repairs and renewals covering the gas which is required from other companies, which are not included in repairs and renewals of the Consolidated Company at all?

A. I have. I guess that is so.

Q. And there would be some additional repairs and renewals?

A. Yes.

Q. And if the Company were manufacturing, or as soon as it commenced to manufacture its own gas entirely, there would be 3238 additional repairs and renewals due to this 3,000,000,000 feet or such a matter which is now procured from other companies?

A. If it stops buying from them——

Q. If it manufactures its own gas?

A. Yes.

Q. And isn't it true too that the repairs and renewals in a coal gas plant are greater than they are in a water gas plant?

A. Yes.

Q. So that the Astoria being a coal gas plant, there would be additional repairs and renewals which must be considered there over what there would be even in the water gas plant?

A. But the full expense is not necessarily increased.

Q. You answer too much in a single question. I am getting a single point for the moment.

A. Well, it is true that the repairs are greater in a coal gas than in a water gas plant.

Q. And in taking into consideration that subject of repairs and renewals we must take into consideration the fact that Astoria is a coal gas plant for its first four billion annual capacity at least.

A. Yes.

Q. So that it is not entirely accurate while we are procuring gas from other companies to take merely the repairs and renewals of the Consolidated and say that that represents the repairs and the renewals chargeable to the entire volume of gas which we sell.

A. Although there are other reasons for my statement, if you wish me to give them.

Q. Well, I asked that question at the moment?

A. I think my statement was fair, taking all things into consideration, but as far as your coal gas is concerned I should agree with you and say yes.

Q. Now, take the Massachusetts municipal plant. Have you the Act here?

A. Yes. Pages 314 and 315 of the Acts and Resolves of the Legislature, Session of 1906.

Q. This is the one to which you referred and which provides for a certain depreciation fund among other things?

A. That is the Act, yes.

3239 Q. Chapter 411 of the Acts of 1906 of the Commonwealth of Massachusetts?

A. Yes, if you say that is the number. I haven't it in mind.

Q. I think so. Section 21 as amended by this Act reads in part as follows:

"Prior to the beginning of each fiscal year the manager of the plant shall furnish to the mayor, selectmen or municipal light board, if any, an estimate of the income from sales of gas and electricity to private consumers during the ensuing fiscal year and of the expense of the plant during said year, meaning the gross expenses of operation, maintenance and repair, the interest on the bonds, notes or script issued to pay for the plant, an amount for depreciation equal to three per cent. of the cost of the plant exclusive of land and any water power appurtenant thereto, or such smaller or larger amount as the board of gas and electric light commissioners may approve, the requirements of the sinking fund or debt incurred for the plant, and the loss, if any, in the operation of the plant during the preceding year."

Q. Now, under the Municipal Act of Massachusetts there is set aside a sinking fund to take care of the plant which is, of course, charged against the consumers of gas, isn't it?

A. Yes.

Q. And there is named three per cent. as the cost of depreciation which may be enlarged or reduced, but that is the figure the act names?

A. Aside from land and water power.

Q. Now, if you take three per cent. and apply it to the Consolidated Gas Company's depreciable property, which it is fair to assume is not less than $20,000,000, perhaps even upon your 3240 figures—we think it is a great deal more than that—what would that make per annum?

A. $600,000.

Q. And if you divided $600,000 by the output for the Consolidated Gas Company which is 13,283,000,000 feet, it would represent, would it not, something like——

A. 4½ cents.

Q. Per thousand cubic feet?

A. Yes.

Q. Now, you testified in Philadelphia quite a number of years ago that 10 cents per thousand was a fair allowance for depreciation alone, didn't you, beyond ordinary current repairs and renewals?

A. About 10 years ago, I think.

Q. And you founded that testimony on the opinion of Mr. Vanderpool?

A. I think that related to coal gas plants, and there was accompanying it a statement that it would be less for water gas.

Q. Now, I asked before the Gas Commission, "Mr. Vanderpool was a great authority on that subject? A. Yes." Was he or wasn't he?

A. Yes.

Q. And when you testified, you accepted Mr. Vanderpool's theory at that time, did you not?

A. I did.

Q. Now, later in Boston, about two years ago, you testified, did you not, that five cents a thousand should be allowed for depreciation beyond the current expenses?

A. Later I modified it.

Q. You changed your mind late in the testimony and testified to what?

A. That the repairs and renewals and depreciation must all be treated as one item and that the more there was spent upon repairs in one year the less the depreciation, and *vice versa;* that the chief thing was to have a total of an adequate amount; that some companies took care of their plant entirely from what they called repairs.

3241 Q. But your first impression was when you testified there, that taking the ordinary current repairs and renewals as the company progressed that five cents additional would be required for final renewals or depreciation or whatever you please to call it?

A. That's right.

Q. Last year, before the Gas Commission, you came over to New York and revised your estimate of three cents when you testified in the Consolidated case and thought that was fair for contingent and reserve fund, did you not?

A. Yes.

Q. And now this year you say it is zero cents?

A. Yes.

Q. You have reached the ground floor now?

A. Yes, I have learned from your testimony about the plant more than I knew then.

Q. You commented in Chicago a year ago on Dr. Humphreys' views on depreciation, did you not?

A. Yes.

Q. And did you make this statement in the testimony (page 1368) before the Gas Commission—I have the Chicago record here also but I am reading this from page 1368 of the printed record before the New York State Gas Commission:

"Now, the best authority that I know of in the gas world in such a matter is Alexander C. Humphreys, who is the veteran manager of the gas works and president of gas associations and now President of Stevens Institute and senior member of the firm of Humphreys & Glasgow, which builds works, and consulting engineer work here and in Europe. He installed the Consolidated in New York and Liverpool, Brussels, Glasgow, Edinburgh, Bath, Brighton, Amsterdam and Copenhagen, and from 1885 up to 1894 he was in charge of the construction and engineering for the United Gas Improvement Company, which has about sixty companies in forty cities."

3242 Do I quote you correctly?

A. I think you do.

Q. Now, in reference to this depreciation of final renewals, what ever you please to call it, with which we are dealing, did you not in Boston state in substance as follows, there is a great depreciation which comes from invention which displaces machinery which may run just as well as it did when it was built, but which the up-to-date manufacturers throw into the scrap pile when the invention gives them something better?

A. I think I said so. It certainly is so.

Q. So it is not merely the wearing out of the machinery, but it is the possible supersession by improvement that you must consider as well?

A. That is right.

Q. And in Springfield, if I am correct, you said that scrubbers, condensers, Lowe, Flannery, &c., condensers were revolutionized in twenty years?

A. Generators probably.

Q. Yes, generators—had been revolutionized in twenty years. Is that substantially correct?

A. I probably said that.

Q. And is it not the case that it is the custom in well managed companies to make an allowance for depreciation or maintenance or some account like that?

A. If you have it there I do not doubt I said it.

Q. Your answer appears to be "there are some well managed plants which temporarily ignore it but their engineers are always protesting."

A. Do you wish me to correct that now or wait till redirect?

Q. I think perhaps you had better wait until redirect unless there is something immediately relating to my question?

A. It was immediately relating to it.

Q. Very well then.

A. In stating that engineers are always protesting against 3243 it, I should say that it depends on the amount of the repair fund. I know of very large enterprises like the Pennsylvania and Lake Shore railroads that out of their repair fund do a lot of construction and I don't believe their engineers protest at all. They have no nominal depreciation fund at all in their entire accounting system and yet they improve their plant right along out of their repairs and renewals, and so when I said that engineers protest I thing it was a little too sweeping. It depends upon the amount of repair fund whether they protest or not, I think.

Q. In other words, engineers according to you do precisely what Dr. Humphreys advocates, that is to put something into extensions instead of into a sinking fund, and thereby increase the value of the plant or keep it up, offsetting any depreciation?

A. Yes, they believe in keeping it up.

Q. Now I find in the Boston testimony (page 275), if I am correct, that you stated that two per cent. on the structural value must be allowed for depreciation; is that right?

A. I may have said that. If you say I did——

Q. Does not that accord with your view?

A. At the present time do you mean?

Q. Did it accord with your view then?

A. Undoubtedly, whatever I said then I believed, and if you find it in the testimony I shall not deny that I said it.

Q. You will have an opportunity to correct it if it is not there.

Mr. MATHEWSON: I have reached a point where I shall change the line of examination a little, and if you wish to take the recess now it will be agreeable to me.

Recess to 2.30 P. M.

3244 After Recess.

EDWARD W. BEMIS resumed.

By Mr. MATHEWSON:

Q. Professor, referring to the reserve which is to be created, apart from the question of how the cost of final renewals shall be financed, the measure of the loss through depreciation is the number of years that a certain part of the plant will be employed before replacement, or the average number of years of the plant as a whole, isn't it?

A. That is the usual method of reckoning depreciation, taking the average life.

Q. When you speak of the average life being 33 years, you say, do you mean anything more than if you establish a sinking fund to take care of each individual class of items in a plant as they require replacement, aside from the ordinary current repairs and renewals, of course, the total of the various sinking funds will equal the value of the entire plant in 33 years?

A. If you take 33 years, or whatever time you take, the sinking fund at the end of the time would be sufficient to cancel the investment that had to be displaced.

Q. And I suppose that the cost of depreciation should appear as part of the cost of the product every year, and that this cost should be spread evenly over the years of the plant's life?

A. When you say evenly, that can be interpreted, I suppose, as an equivalent percentage into a sinking fund, or as President Humphreys says, an equal number of dollars, so that I hardly know how to answer your question. If you interpret the word "evenl'y," in the sense of an even percentage into a sinking fund, I would say yes.

3245 Q. Would you say yes if you interpret it to mean a uniform number of cents per thousand each year?

A. I think the one would probably be not far from the other, yet not necessarily, because the ratio of sales to investment varies; the tendency being for sales to increase faster than investment.

Q. Of course, the life of some parts of the plant exceeds 40 years or 33 years?

A. Oh, yes. In fact——

Q. So when you speak of an average life of 33 years or 40 years you are really using a term which is inexact in itself?

A. Yes. There is no absolute agreement as to the life of a plant and, of course, it varies in different cities.

Q. Your testimony was that 33 years is the average life of a plant, was it not, or your estimates have been based on that in your testimony heretofore?

A. Some estimates have, and some on longer life.

Q. And Dr. Humphreys used 40 years, didn't he?

A. Yes.

Q. Now, neglecting the question for the moment of how the fund shall be provided or the loss should be taken care of, that is the question of financing, the yearly loss on a 40-year life for each one hundred dollars' worth of depreciable property would be one-fortieth, or $2.50 on each $100, would it not?

A. If you do not invest it. But you don't have to invest that amount——

Q. Well, however you are to get it and wherever you are to get it, if you assume 40 years is the life of a plant it will mean $2.50 a year to make up the $100.

A. Yes, without any interest or profit.

Q. But whether it is interest or profit or not?

A. If you put it into a stocking it will take $2.50 each year to make the $100.

Q. But if you want to replace your $100 at the end of 40 years you have got to have enough money to equal $2.50 for forty 3246 years, or else you will not get your $100, whether you get it from accumulations of interest or other sources?

A. Yes.

Q. So that the $2.50 on each $100 in case of the forty-year life of a plant is something that must be dealt with in some way, and must be procured from some source.

A. Yes.

Q. And this means in substance that the yearly loss will be 2½ per cent. of the depreciable property, doesn't it?

A. If you ignore the element of time.

Q. I am taking forty years——

A. No, but if you ignore the element of time during forty years that is true, but since the loss is not felt very much until near the end of the forty years, you can take account of time as related to compounding of interest.

Q. Now let me see. You take a plant like the Consolidated Gas Company that has been in existence for seventy-five or eighty years or 100 years; is it not true that if you take a forty-year life of a plant, 2½ per cent. of the depreciable property on the average will disappear each year and have to be finally renewed or finally replaced? In other words, it is not going to wait until the end of the forty years and then all go to pieces like the "one hoss shay," is it?

A. No, but whatever the part be, whatever the life, when a part has been in existence for forty years or fifty years and has reached a certain gait, as it were, then a certain amount of renewals must be made each year.

Q. And it would make no difference, would it, if you established a sinking fund for each class of property separately, the result would be the same?

A. I think it would make a difference in the effect on the consumer.

Q. Let us see if it would. If to take care of a plant, assuming a forty-year life, you have to get from some source $2.50 on each $100 per annum, then on the thirty-three-year life, such as you 3247 have assumed in previous testimony, you would have to get 1/33 of $100 or $3.03 per annum, would you not? Forget for the moment whether it is coming from interest or somewhere else.

A. Yes. That amount would have to be at hand, I should say.

Q. Then if it would be $2.50 on the theory of Dr. Humphreys' taking forty years, and $3.03 on yours, that would make a difference of 53 cents, which you would have to procure from some source beyond what Dr. Humphreys would have to procure under his forty-year theory, per annum, would it not?

A. If you assume that that difference of life between thirty-three years and forty years exists. I don't think in all cases it does. I think that in a company where mains do not depreciate any more than they do in either Boston or New York there would be a longer life, forty years or upwards rather than less. In some cities and with coal gas plants it might be less.

Q. But we are making an assumption, Doctor, and in this case I understood you to take thirty-three years as your average life of plant, didn't you?

A. I said I had in some cases.

Q. Didn't you in your figures here?

A. I don't remember now, but the more I have studied it, the more I think that in view of all the testimony as to the durability of mains in New York, that thirty-three years is altogether too short a life.

Q. Well, didn't you take thirty-three years in your estimate before the Gas Commission?

A. I don't remember.

Q. Well, don't you? Just think a moment.

A. No, I have not had time to study just what I took.

Q. That was less than a year ago.

A. But if you say I took it, I will accept it.

Q. No, I ask you if you remember?

A. I don't remember.

3248 Q. You did not take over forty years, you are pretty sure about that?

A. Yes. I did not.

Q. And if the average life of a plant was one year, the loss from depreciation would be, of course, 100 per cent. each year and you would have to add that all in to the cost of gas?

A. Yes.

Q. It is simply a question of time?

A. Yes.

Q. Now, taking your sinking fund upon the theory you have advanced, you say it would be $1.05 for the first year?

A. On a forty-year life I believe that is it.

Q. And so the second year it would be a certain sum, and in order to reach the entire value of the plant in forty years, you would have to leave that $1.05 free for the entire forty years, would you not and accumulate at interest?

A. Yes. I think it was on a four-per-cent. basis.

Q. So that your theory proceeds upon the leaving of the money in a sinking fund and letting it accumulate, instead of using it.

A. Yes.

Q. Now Dr. Humphreys proposes on the other hand to use $2.50, we will say, per year on each $100, and charge that in operating expense, but that goes into renewals and extensions. Now if you don't make the renewals and extensions from that source, you have got to borrow money to make them, haven't you?

A. No——

Q. Or raise capital in some other way?

A. No. As I understand——

Q. Haven't you?

A. As I understand Dr. Humphreys' theory, the first few years' renewals would not take all of this $2.50 and it would be put into the plant in the shape of extensions or new construction and would be drawn on later for meeting the depreciation when it appears. Now, whether it is thus put into extensions—it can be put into extensions that way as a resource earning a return or it can be put into a sinking fund outside of the gas investment. 3249

Q. I think you misunderstood Dr. Humphreys. If I understand his theory correctly, it provides for putting this $2.50 per $100 we will say, assuming the amount annually back into the property?

A. Yes.

Q. Thereby keeping the investment good by additions or extensions which will take the place of plant which is losing its life?

A. Yes, but that does not differ from my view of it.

Q. If you put your money into a sinking fund instead of using it in that way, you have got to get capital from some source to make your extensions and additions, haven't you?

A. Yes, for your extensions you have.

Q. Then you have to pay a return on that property?

A. Yes.

Q. And that must come out of the consumers of gas?

A. Yes.

Q. So that while you have your sinking fund accumulating at four per cent., you are at the same time borrowing money to make these extensions in your case and paying five or six or eight or even ten per cent. for it, if you issue it as capital, are you not?

A. Of course I don't think you have to pay any eight or ten per cent.

Q. Well, you have to pay at least five per cent?

A. Yes.

Q. So that the interest that the consumer has to pay more than offsets the interest that he gets or that the company gets on its sinking fund?

A. I think the matter becomes more burdensome to the consumer during the first few years——

Q. That is your statement, but I am trying to get down to a point where you will show how that is.

3250 A. As I recall it, I can produce it next time, President Humphreys said so himself in an article in "The Progressive Age" within a year.

Q. He will testify for himself later perhaps, but I am now getting your testimony. You would produce a fund equal, if you took a 40-year life, to $2.50 per annum for forty years to make up your $100, and that would be produced either by taking the fund out of the earnings or by accumulating interest upon it after it was taken out, a smaller sum being put into a sinking fund. Now, Dr. Humphreys gets precisely the same sum by taking $2.50 for forty years. You cannot make something out of nothing?

A. Certainly. But in the one case you only take $1.05 a year out of the business, putting it into a sinking fund.

Q. But on the other hand you have to have capital, you have to get in new capital to make the extensions and additions which would have been made by the 2.50, if that had been put back into the business, so that you gain no advantage. Don't you see so?

A. Well, we are facing a concrete proposition in which the company during its past one hundred years has not accumulated any fund for either purpose, so we are as it were beginning the thing.

Q. Oh, we have got a plant here that is of age, Doctor, and we must take it as it is, as you have said in some cases.

A. Yes, but you would have to, I should think on that principle, have to divide your present capital or structural value into such portion of it as a legitimate sinking fund on President Humphreys' theory would have amounted to at this time, if it had begun to be invested forty years ago.

Q. Did not Dr. Humphreys in his article to which you refer, illustrating the effect of a sinking fund, say that the final year you would have to put in $4.85, or put in $1.05 the first in order to produce the fund?

3251 A. Yes, but you would not if you put it into a sinking fund, you would only use $1.05 each year.

Q. And your figure is on the basis that that you produce it at the end of forty years?

A. Yes, at four per cent.

Q. As a matter of fact, so long as a plant does not go to pieces all at once and fall flat, at the end of forty years, you have got to put money into your final renewal, supersession, removal to Astoria, or whatever else it is that requires some supersession from time to time as occasion requires, haven't you?

A. Yes.

Q. And if you used your sinking fund for that purpose you would not have it running for forty years, would you?

A. No, although other portions of it would run for more than forty years, so that is the theory, that the forty years is an average. Some of it would be withdrawn in twenty years and even ten years and some would last eighty years.

Q. But if you wanted to withdraw in twenty years you would not have that part running for forty years and the accumulation would not occur?

A. But I think the whole thing mathematically would work out the same in the end, if you assume that forty years is the average.

Q. Would not the same result follow more cheaply if instead of having an accumulation at four per cent. for twenty years for a part of your plant and borrowing money at five or six per cent. to add to your plant, you had added to your plant by putting in a certain amount each year and made those extensions and required no extra capital therefore to produce them?

A. It may be quite as good policy for a company to finance that way, but when you come to reckon as part of operating costs, you can get at it much more scientifically on a sinking fund basis.
3252 But if they prefer to substitute another plan in their own private financing which works out just the same at the end of forty years, there is no objection to it; but in the estimate that we are making in operating cost the scientific theory, I believe, is the sinking fund.

Q. I am proceeding on the theory of advantage to the consumer as well as the scientific theory, and if the consumer pays a smaller amount into a sinking fund but pays a larger amount for return upon capital which has been required for extensions because the money was put into a sinking fund, then the consumer is not benefited, is he, if they offset?

A. The total profits of the company may be greater by investing the sinking fund in the property rather than in an outside sinking fund investment, and so far as the consumer shares in the profits of the company he would benefit too under that supposition, but it is very much more fair and more correct, I think, in approaching a company that has no sinking fund, and no accumulated depreciation fund, to apply the sinking fund, and then admit that the company can apply any other actual method of financing they please.

Q. How do they do it in Massachusettts in connecting with the Municipal Act to which you have just called attention? Is there any provision in that Act whatsoever for a sinking fund?

A. I understood there was.

Q. Will you read it and see if it does not provide expressly that they shall be put into extensions or something of that sort (handing paper)?

A. I will read, shall I?

Q. No. I merely asked you a question. I can't think it is necessary to read it yet. The question was whether there was any provision for a sinking fund there to be set aside as such?

A. It appears to be in this way. The law states as among
3253 the expenses of operating a municipal plant this: "The requirements of the sinking fund or debt incurred for the plant." I interpret that to mean that in borrowing for the plant the town or city very likely has to agree to a sinking fund provision or there may be a State law as to all municipal bonds.

Q. I don't think it is worth while to speculate as to what there may be. Look at the Act.

A. Well, whatever law there may be regarding the sinking fund must be complied with. That is all that law says. It must comply with the requirements.

Q. That refers to a sinking fund to retire bonds, doesn't it?

A. Yes, and it must be complied with.

Q. That is not a sinking fund for depreciation purposes in the ordinary sense or final renewals?

A. Oh, no.

Q. Won't you read along down further in the Act and see if it does not provide that the depreciation fund may be used only for extensions, reconstruction, enlargements and additions, thus maintaining the investment?

Mr. **Burr**: In excess of ordinary repairs?

Mr. **Mathewson**: Of course, in excess of ordinary repairs. I am now talking about this final renewal fund.

A. It provides that the three per cent. on the property aside from land shall be put into a depreciation fund and shall be used for renewals and reconstruction.

Q. Extensions, enlargements and additions?

A. Yes, and "the surplus, if any, of said annual allowance for depreciation after making the above payments, shall be kept as a separate fund and used for renewals other than ordinary repairs, extensions, reconstructions, enlargements and additions in succeeding years." Now when I read that I was uncertain, and I still am uncertain from the punctuation just what it means. 3254 I noticed that a few days ago. For example, I don't know whether the expression, "other than ordinary repairs" is to be followed by the implication "other than ordinary extensions," and "other than ordinary reconstruction," or whether extensions is to be included on a parity with renewals; it is not clear grammatically.

Q. You have made a study of Massachusetts cities I judge, from your testimony, and you seem to have access to the files of the Massachusetts Gas Commission. Don't you know that it is the practice and custom of the Massachusetts Gas Commission to require the investment of these depreciation funds in additions, enlargements, etc., to keep the investment good and that they do not consent to the establishment of a sinking fund to accumulate for a long term of years, such as you have advocated.

A. Up to a few months——

Q. I merely asked that question. Won't you answer it, please?

A. I can only answer it by a statement. Absolutely, I can only answer it by a statement.

Q. I ask you whether you don't know that to be their practice or custom. Can't you say whether you do or not?

A. It has not been their practice and custom.

Q. It has not?

A. There has been no practice in the matter.

Q. You think so?

A. Yes, I do. The law on depreciation in Massachusetts has been only a dead letter. It has been only a bookkeeping charge. The law until that was passed did not require a cent to be set aside for depreciation; it only required the towns owning their plants to put the bookkeeping allowance for it in their reports.

Q. You put it in this way. Don't you know that the towns
3255 themselves would not consent to the establishment of a sinking
fund of the character that you advocate, and therefore the terms of the present law and the treatment of the accounts by the Commission?

A. I don't think there has been a sinking fund except for the debt.

Q. But I was going to ask you, and I will now ask you, if you will name a single gas company which you know maintains an accumulating sinking fund of the character which you have advocated instead of putting its money into enlargements and additions for the purpose of keeping the investment good in that manner?

A. No, I don't know of any.

Q. Now in your testimony in Boston some time ago, you were testifying in reference to the Brookline plant and claiming that the Brookline plant was of less value than was claimed, because it had not charged a sufficient sum to its depreciation, repairs, renewals, &c., were you not?

A. Yes.

Q. In that connection do you remember that you cited some English cities to sustain yourself?

A. Yes.

Q. And did you not cite nine municipally owned plants, Bradford, Boulton, Birmingham, Carlysle, Leicester, Manchester, Nottingham, Oldham and Salford, to show that the funds there for repairs, renewals and depreciation were equal to 12.66 cents.

A. While I don't remember the exact figures, that impresses me as substantially what I said.

Q. It occurs at page 419 of your Boston testimony. Do you remember saying that to this should be added one-sixth for wages because wages were higher in the United States, which would produce 14.7 cents?

A. Yes, I think I said that.

Q. And when you were asked why not add more than one-sixth,
if the difference is 25 to 30 per cent. (meaning in labor) your
3256 answer was "Because all distribution is not labor."

A. I think that was substantially what I said.

Q. Now the 10.89 cents which you have allowed for the Consolidated Gas Company and saying that you allow nothing beyond that, is nearly 4 cents less than the 14.7 which you showed there, isn't it?

A. Yes.

Q. Now let us look at your Chicago estimates made recently, as they appear in the pamphlet to which attention has been so often called. Did you not there on page 43 allow 10.16 cents for repairs and renewals and supplement that with an additional three cents "in order to be surely on the conservative side?"

A. Yes.

Q. That makes 13.16 cents?

A. Yes.

Q. And did you not say at page 41 "The New York Consolidated Gas Company produces about one-quarter of the gas which it makes in the form of coal gas and therefore requires more extensive repairs than the Chicago Company"?

A. Yes. . Where was that on page 41? I want to look at it.

Q. Page 41, second column.

A. That is right. I have found it.

Q. And do you remember the testimony of Mr. Cowdery, of the Laclede Gas Company in St. Louis, that he had known as much as 15 cents variation in the cost in a single year of gas within the vicinity?

A. He used some figure like that. I don't remember exactly. In the coal famine, which I thought he referred to when I heard him say it, there was of course quite a change in the price of coal and also in the demand for gas.

Q. And do you remember his statement which appears on page 22 that with the prices that gas companies are now making they must figure further into the future and on a sufficient basis, after stating that he thought ten cents should be allowed?

3257 A. I have not found in all my studies of the Massachusetts companies for twenty years that on the average for any year there was any such change as 15 cents.

Q. Well, I will read from Mr. Cowdery, on page 22 of this pamphlet, and see if this impresses you as fair:

Mr. Burr: This is the report of the Chicago Council you are reading?

Mr. Mathewson: Yes, his statement contained in that report.

"Q. I make the stat-ment that repairs and renewals as they should be made every year with a company conducting its business properly would require in the neighborhood of 10 cents per thousand and unless some extraordinary allowance were made for extraordinary things that would happen, some other means must be found by the company to raise the money for such a purpose. Mr. Bemis cannot possibly show this to be different if he states conditions as they exist in this country."

Is that a fair statement?

A. Of what he says?

Q. Yes. And do you agree with that?

A. No. I agree that he said it.

Q. You don't accept his estimate of 10 cents?

A. No, not as applied to New York. I did think it would apply to New York but I do not think so any more.

Q. How recently did you change your mind on that subject?

A. On studying the testimony you have put in as to the increase in valuation of your property since 1884 over and above the amount you have spent for construction.

Q. We will come to that in a few moments, and I think we can satisfy even you on that subject; if not, we can the Master. Referring to the——

3258 A. I may say that I have also learned more about the English companies since I was over there this summer as to my testimony about them. I find they have been improving their plants out of their repair and renewal fund, so they have been furnishing part of their capital that way, the municipal plants I mean, and it is also true of Sheffield and some of the other private companies.

Q. And don't you remember in Syracuse your statement that you were aware of an instance in which the coal bill of a gas company no larger than the Syracuse company had varied $50,000 from one year to another?

A. I was asked, I think, some such question on cross-examination. I don't remember how I replied and I certainly do not remember what company I had in mind.

Q. It appears at page 2979 of the Syracuse Minutes, that you were asked that question and that you said "Not as much as that save in the big strike four years ago. I think it did then." Now what company did you have in mind at that time?

A. Well, I don't think I had in mind any company, but knowing the fluctuations in coal, I took it for granted that that might have occurred in a very big plant.

Q. Well, no larger than the Syracuse plant?

A. Oh, I think it would not have occurred in a plant like that.

Q. What is that?

A. I think it would have been a larger plant than that.

Q. The question is "Q. Have you ever known a coal bill to vary from one year to another in a company no larger than this at least in the sum of $50,000?"

A. Then if I said that it certainly was a mistake because I certainly don't know of any such plant, but I must have had in mind that there were plants in which it would vary, without referring to a plant of that size.

3259 Q. If you did refer to a plant of that size, as the question would indicate, and the sales of that company were only 350,000,000 feet a year, that would mean a difference of something like thirteen or fourteen cents per thousand feet of sales for the coal bills?

A. Yes, but I don't know, as a matter of fact, any such plant.

Q. And you wish to modify that answer in that respect?

A. Yes.

Q. Now, if you should find a company charging twelve per cent. to depreciation, taking that out and putting it into plant, you would think that excessive, wouldn't you?

A. Twelve cents or twelve per cent.?

Q. Twelve per cent.

A. Yes, I should think it was.

Q. You would think they were building up their plant and enlarging it without letting it appear in construction, wouldn't you?

A. Yes.

Q. And doing so very largely and very liberally?

A. Yes.

Q. Would the same be true if you took ten per cent.?

A. Yes.

Q. And anything down to the two per cent. which you mentioned in Boston as a fair figure?

A. And even that two per cent. depends upon the amount they put into repairs.

Q. Yes, but assuming that they put what you may call the normal amount in repairs, your answer would be to that yes, would it?

A. Unless there were exceptional conditions.

Q. Yes, I mean the average and ordinary conditions, of course. Now, I think you have stated, have you not, that there is no definite proportion in the gas business which you have been able to figure out between the sales and operating expense?

A. Yes, I have said that.

3260 Q. Now, let us take this 10.89 cents per thousand, to which you have not added the three cents this time, but which you did before the Gas Commission a year ago, and see whether your theory is correct on which you have excluded the three cents now. If a piece of apparatus is replaced, it is proper, is it not, to charge to depreciation to reduce the capital of the company the amount which that piece of apparatus cost?

A. Not necessarily.

Q. Well, is it not proper to do so, is it not the usual custom when a piece of apparatus is displaced, to charge on the one side to depreciation the cost to the company, as it stands on its books, on that piece of apparatus?

A. Not if you are going to put into capital account more than you had before, it is not proper, that is, if you are going to put any of that discarded into capital.

Q. We will assume you are not, but that it is something which is absolutely abandoned.

A. Let me put it this way——

Q. An abandoned main that is absolutely useless and will never be used.

A. If you have a main that cost $1,000 and you discard it and put in a larger and better main costing $3,000, it is all right to charge off the one thousand dollars for depreciation if you do not add to the value of your property more than $2,000. But if you come in and ask the right to earn dividends on more than two thousand dollars, then to that extent you have charged off too much.

Q. Let us see. If we replace a piece of apparatus, a main, we will say, that cost $1,000, and put in its place a larger main that cost $3,000, is it not quite proper to charge $1,000 to depreciation and charge the $3,000 to construction, the net result being to increase the $2,000 in the capital account?

3261 A. It would seem so, unless it appears after awhile that you have increased your capital account on that ground more than $2,000.

Q. We are assuming that we do things in a businesslike way and that the books represent the facts. That being so, that would be quite proper, would it not?

A. Yes, under those circumstances.

Q. Now, the piece of apparatus, in other words, which is removed, would be charged off at its cost, of course, and the new apparatus would be put into capital account to increase capital account at its cost and any difference would be added to capital account.

A. That is right.

Q. Have you not heard Mr. Carter testify, or haven't you read his testimony that that is exactly the method that the Consolidated Gas Company has pursued?

A. I could not understand his testimony as to services, I think it was, as meaning precisely that.

Q. Well, you are referring now to an affidavit, and I will take that up later. But I am referring to his testimony which has been given in this case and also before the Gas Commission.

A. I did see testimony to that effect but when I read the valuations here I saw that it was wrong.

Q. I don't think you did see it was wrong, because the testimony was absolutely correct, professor.

A. Or the valuations were wrong, I don't know which.

Q. I don't think either were wrong. We will see about that in a minute. If a main cost the company a thousand dollars and by reason of the fall in pipe it replaced that pipe for $800 it would still charge $1,000 to depreciation, would it not, and only $800 to construction, and its capital account would be reduced by $200?

A. Renewals hardly ever take that form. That is, while prices fall renewals are generally of larger mains and services,

3262 Q. That may be so, but I am assuming for simplicity that they were of the same size?

A. For that year's operations it would not be true.

Q. Assuming that to be the case, then the capital account would be reduced by $200, wouldn't it, by proper bookkeeping?

A. I should say so, with that supposition.

Q. Now, let us take a ten-inch main which cost a company at the rate of $60 a ton for pipe, which is inside the figure that Professor Marks took for pipe at the same times?

A. That was not the basis of Rowland's value in 1884.

Q. No, no, I understand that. That is another proposition. Supposing that it is desired to replace a ten-inch pipe by a twelve-inch pipe and that by reason of the fall in pipe the twelve inch for the same number of feet cost less now than the original cost of the ten-inch pipe?

A. Yes.

Q. You then would have a reduction in your capital account, would you not?

A. Yes.

Q. And at the same time you would have a better pipe, larger pipe, and a better plant, so far as that goes?

A. Yes.

Q. Suppose that you take services and assume that the company finds it possible to replace an old service which cost it a certain sum with a service of twice that capacity, at exactly the price that the old service cost, then there would be no increase in the capital account at all, would there?

A. No.

Q. Still you would have a new service of double the capacity of the old service?

A. Certainly.

Q. So if those results followed to the Consolidated Gas Company and produced the result which Mr. Carter testified to, and the Company at all times followed its approved system of bookkeeping, of charging off against property the cost of what it has replaced and charging to increased property the cost of what it has acquired to take its place, no fault could be found, could it? 3263

A. There would be no fault with that part of it. There might be a fault with the valuation that followed it.

Q. We are not dealing with the valuation that followed it. We are dealing——

A. Well, you want to judge one by the other.

Q. Because what you dealt with on Mr. Carter's affidavit as to services was the book value and what they stood on the books, not the present valuation at all. You understand that, don't you?

A. Not if I understood your question. I dealt with Rowland's value as a structural value in 1884, and the present value as a structural valuation to-day and I understood that neither one was a book value but both were structural values based on an inventory.

Q. There is where you have made your mistake, because if you read Mr. Carter's affidavit again you will ascertain that Mr. Carter was dealing with the book value, showing how much the book value had been increased, and was not dealing with the cost of reproduction of those services to-day at all. That being so——

A. Well, admitting that, that would not apply as to what I took as to plants and holders by Mayer and certain other things I took. And as to the mains and services and meters, I understood the testimony to be that the true value was at least equal to the book value, and I understood Mr. Addicks to say that he thought it could not be duplicated without more than that book value.

Q. I am dealing now simply with the book value. Assuming I am dealing with the book value and that it charges against capital, and charges in favor of capital have been made in the approved manner to which we have referred, there would be no criticism, no matter what the result might be as to small or large increase, would there?

A. No.

Q. Then, if that be the case and if my supposition is right you still then would allow this three cents for the final renewal which you have excluded on the other theory. 3264

A. Yes, because the total increase in valuation of the property now over 1884 is over twice the increase in book value.

Q. You are speaking now, Professor, of the cost of reproduction. I am not dealing with that at all because Mr. Carter's affidavit, where he showed an increase in capital account chargeable to services of only $177,000 in twenty-one years, dealt solely with the present book value of the services and not with the cost of reproduction. You understand that, don't you?

A. Well, on that particular point——

Q. Don't you understand that?

A. I don't remember as to—yes, I got $177,000, but I find somewhere in the testimony of your witness they put a valuation on those services to-day of $1,994,034, an increase of $959,793 over the valuation that Rowland put on them.

Q. Oh no, not at all. You found that the cost of reproduction today was $1,994,000?

A. Yes; and that the book value of these services was about $1,212,000.

Q. Well, Mr. Carter used the $1,212,000 in reaching his $177,000 and not the larger sum.

A. Yes, that is right.

Q. Then if in the books of the Company so kept renewals and replacements were charged in the manner we have discussed here; then there would be no inflation of property at the expense of the consumer of gas and you would be compelled to allow the three cents beyond the 10.89 on that supposition, wouldn't you?

A. If it should appear—I take services now alone which are not typical of the whole situation, but taking services now, which we are speaking of, if it should appear that the Company made a claim on behalf of the increase of cost in duplication and claimed they were entitled to some consideration on that account, in charging for
3265 gas, then it would certainly be right to take into account that the repairs and renewals were too heavy on the services.

Q. But, taking the book values of the property and assuming that that 10.89 cents has simply taken charge of the current repairs and renewals and that no part of it has gone in to swell property accounts, but that the accounts in relation to replacements and renewals have been conducted in the approved manner that we have suggested, then you would need a final renewal allowance beyond the 10.89 cents, the same as you allowed before the Commission?

A. Not if it should appear that the property as a whole had greatly increased in value, aside from land. Now I do not allow for increased value of land or mains on account of paving, but if it should appear that all the other property had increased in value more than that book value and you made any claim on that account than to the extent to which you proved your claim, to that extent would 10.89 be excessive.

Q. But I understood you to say that you based your conclusion on some assumption that part of this 10.89 which has been expended for current repairs and renewals had gone to swell the plant account?

A. It may have done so.

Q. Well assume that it did not, as Mr. Carter testified it did not, then that would modify your conclusions?

A. Not if the property has really increased in value.

Q. Then the point is if the property has increased in value, that is to say the present cost of reproduction is greater than the cost to the Company, that is what controls you and not the putting of any part of this 10.89 cents into additional plants, is it?

A. Well, I exclude the land and the mains, but so far as relates to the rest of the property I find, excluding land and mains, that your witnesses have reported the property has increased in 3266 value in excess of the book repairs and renewals by $10,671,000. Now, if there is any claim made that any portion of that should go into capital account, then to that extent is the 10.89 excessive.

Q. You understand the testimony is that the cost of reproduction of these plants is a certain figure?

A. I have taken your witnesses on that, for what they have testified.

Q. Just a moment. I want to find what you understand. You understand from the testimony that the cost of the reproduction of this plant is a certain figure?

A. According to your witnesses, yes. I understand it so.

Q. That land we will assume, which cost the company $11,000,000, is now worth fifteen and one-half million dollars. Now, no part of that increase in land has come out of that 10.89 cents that we have spent for ordinary renewals, you understand that?

A. I do.

Q. And that increase in the value of the land has been a natural and normal increase?

A. Certainly.

Q. Now, supposing you take mains, the fact that the mains to-day would require $12,600,000 to replace them on account of the expensive pavements which have been put down, as against the cost of $7,852,000, is not due to any part of that 10.89 cents going into mains to increase their values; you understand that too, don't you?

A. Yes.

Q. So that the increase in the value of the property is not in any way due to the use of any part of that 10.89 cents for anything else than current repairs and renewals; you understand that, do you not?

A. No, I have my grave doubts about it.

Q. Well, assuming that to be so, as Mr. Carter has testified, and waiving your doubt for a moment, then you would have to add something to the 10.89 cents for the final renewal of plant on 3267 expiration of life, upon the theory you have enunciated, wouldn't you?

A. No.

Q. Simply because these items of plant, like land and mains and services have increased by what we may call normal processes, and without taking any part of the increase out of the consumers of gas you would say we are not entitled to any reserve fund to take care of final renewals, would you?

A. No, if you claim profit on that appreciation.

Q. You mean by that if we claim that we are entitled to a return?

A. Yes.

Q. On the present value of our property we then are not entitled to any reserve fund to take care of final renewal of our property, is that it?

A. Well, so far as your theory of appreciation balances with the theory of depreciation. You cannot work the one without the other.

Q. Well, I don't know whether we can or not. We are going to rest on the law, so far as we are able to ascertain it.

Mr. **Burr**: Well, that is the question.

A. Now, so far as depreciation has not balanced, why, of course, we must take it into account.

Q. Supposing the appreciation of that property had a good deal more than counterbalanced the entire 10.89 cents that we spent for ordinary repairs and renewals, then we are in a dreadful state, aren't we? What would happen then?

A. Why, I should say if you claimed there was profit——

Q. In that case we ought — divide up part of our property among the consumers of gas, ought we not, on your theory, because it had increased beyond the amount of 10.89?

A. That is not all your expense of gas production. It would sweep out the entire repair and renewal accounts. Certainly
3268 you cannot work a depreciation theory and an appreciation theory unless you work them together.

Q. Now, let me call your attention to another point. When we are figuring upon the amount required for final renewal of these plants in forty years, or any other time, you have got to take the plant as it now is and figure the reproduction of this plant, haven't you?

A. I deny that as to land or mains.

Q. Well, if we have got to reproduce mains at the end of forty years we have got to reproduce mains under this present expensive pavement? You cannot suppose there will be any poorer pavement at that time than there is now; isn't that so?

A. Yes, but you do not replace them in forty years.

Q. And we have got to figure our sinking fund or our depreciation fund, whichever way you treat it, upon a basis which will reproduce the property as it now exists, haven't we? Mains, services and other things, in computing its life; is not that so?

A. The land does not have to be replaced.

Mr. **Burr**: The testimony is a main does not die. You may have to put down larger mains.

Mr. **Mathewson**: That is a replacement which may be a final renewal.

Q. (Question repeated:)

A. It is not true as to land, and whether it is true as to mains I should have to consider a little more. It would be true as to everything else.

Q. But you could not replace your mains upon the expiration of their life, whether it is ten years or one hundred years from now without replacing those mains under pavement just as expensive as there now is, so far as you can see.

A. When that replacement occurs under this more expensive pavement, then by the theory that we both agreed on a little 3269 while ago the difference between that replacement and the original cost of the main can then be charged into capital account, and not until then.

Q. But we must provide for the final death of the plant by the sinking fund which you have just referred to, and I want to know——

A. You will then——

Q. Just a minute. I want to know what the value of the property is which we have got to provide for or for the replacement of; and isn't it the property as it is to-day and not as it was fifty years ago?

A. Not as to mains, services and land; but as to everything else I agree.

Q. How are you going to replace the mains except by going under the pavement as we find it?

A. Then you can charge it to capital account.

Q. Do you mean to say that you charge that to capital account, the replacement of the mains?

A. Less the original cost.

Q. Has not your whole theory been that we are entitled to replace the plant at the expiration of its life and to charge something against the consumer of gas to produce a fund for that purpose?

A. As to the original cost of the mains, that is my theory, but I say, just as we said a little while ago, if the main cost $3,000 that took the place of a main costing $1,000, the $2,000 difference would be charged into capital account; the $1,000 would be charged off. Now, suppose that $3,000 is not due to the extent of more than $1,500 to a difference in the cost of the pipe; suppose the other $1,500 is due to the difficulties of paving which did not exist when the original pipe was laid; it would still remain true that the new main cost $3,000 and the old one $1,000, and the difference between the two, or $2,000, I would charge to capital account.

Q. In other words, we could wipe out our entire capital, 3270 and be obliged to, and have nothing left if there were expensive pavement enough so that it cost a great deal to get under it, couldn't we, under your theory?

A. No.

Q. Why not? If you have got to charge to capital account any replacement of that kind instead of charging it against the consumers of gas by the establishment of a depreciation fund, you concededly would wipe out your entire capital by what might be charged to it in that way, if pavement were expensive enough?

A. Oh, no.

Q. Well you would cut a very large hole in it, wouldn't you?

A. No.

Q. If you had to replace the system of mains in New York City to-day, we will say which cost $7,852,000, and we had to pay $12,600,000 for it, would you say that we charge $5,000,000 against our capital account and impair our capital to that amount?

A. I should say this, that if by virtue of changes in conditions of New York——

Q. Won't you answer my question first?

A. You would be entitled to charge for cost and return on that increase of investment made necessary by the conditions in the City, and I still say that as to mains that when you have to renew them by virtue of paving you then have to put in a bigger capital account, and you will be justified in earning a return on that capital.

Q. In other words we would be entitled to increase our capital by $5,000,000?

A. Yes, for your expenditures.

Q. And then against consumers of precisely the same amount of gas we would have a right to charge in that case enough to produce a return upon $5,000,000 more of capital than to-day?

A. Certainly.

Mr. **Burr**: It does not appear it is precisely the same amount of gas.

3271 The **Witness**: But that would never occur under those conditions.

Q. But it will occur in degree from time to time and you must know that we are replacing mains constantly under these pavements?

A. As I understand the theory, those charges now go into book value. I understand to-day if you tear out a main and put in another main, having to dig through new pavement for the purpose, and if the entire cost is $3,000 for the job, no matter how much is on account of the new paving, that you charge the entire $3,000 to the book value.

Q. But our depreciation fund of three cents which you allowed last year was to take care not of these ordinary current repairs and renewals but for extraordinary life such as you stated, such as the removal to Astoria, which leaves our plants here in good condition, many of them—all of them we say—you say many of them—and which is not due at all to the wearing out of the plants; and we have got to determine, have we not, whenever we establish a final renewal fund some basis upon which that fund may be computed, and the question I am asking you is, isn't it the present value of the property that has to be replaced, excluding land, if you please for your purposes?

A. I say, no. Excluding land and mains and services I say yes.

Q. As far as manufacturing plant and holders are concerned, it all applies, so far as mains and services, it does not?

A. It does as to the pipe. But I am talking as far as the paving is concerned, as to mains and services.

Q. And we have got to charge that to additional capital if it ever becomes necessary to replace?

A. Yes; and that is what you are doing now, as I understand your book value of account.

3272 Q. I don't know whether we do or not but I am getting your views on it. Now, you have referred to Boston, which is obliged to maintain 16 candle-power against our 22. What would be the difference in the cost of six candles?

A. Some would say that it was a gallon and a fifth of oil. Some would say it was only a gallon.

Q. Well, a gallon and a fifth would mean about five cents, wouldn't it?

A. Yes.

Q. For the difference in the candle-power?

A. With oil at four cents.

Q. Well, you are referring to oil?

A. With oil at four. It would be 4.8 cents, of course.

Q. Yes, it would be about five cents. How did you take pains to find whether any city in Massachusetts paid as high as four cents for the oil?

A. I think I have obtained figures, tried to, of all the large cities of the State.

Q. You found some of them paid at least four cents for oil, didn't you?

A. I think one or two did, but I am not sure. I can tell if you wish.

Q. I was wondering whether there were not some that paid more than Lynn?

A. Yes. I will say the average of all of them is much lower than your price.

Q. You know the average of all the companies in New York is much higher than that, don't you?

A. I don't recall any but the Mutual which pays more.

Q. Didn't you see the statement of Professor Marks as to the average of certain oil in cities which he cited?

A. Yes. I thought you meant New York City.

Q. Don't you recall in the cross-examination he was asked as to the cities he left out and that the average there was over five cents?

A. Yes, I remember that testimony.

Q. Isn't it your information that the prices paid in New York
City by the Consolidated is not in excess of the average paid
3273 by the cities in New York State?

A. So far as that testimony shows it. I don't think that it is very exhaustive testimony.

Q. Oh, no, but it was derived from this Brown's Directory on which you place such weight.

A. I haven't quoted Brown's Directory for oil.

Q. No, but you have on other things. Let me quote it on a few.

A. On the miles of main in the Ogden Company in Chicago I quoted Brown's Directory or started to.

Q. You notice that Doctor Marks quoted it constantly?

A. He quoted it on oil.

Q. And now let me ask a further question about Boston. Don't you know that the Boston Company procures considerably more than half its gas from the New England Coal & Coke Company, which is a coke company?

A. Yes, I read the figures. I think it is about half.

Q. And this New England Coal & Coke Company is not a distributing gas company at all, is it?

A. No.

Q. Just a manufacturing company?

A. That is right.

Q. Its business is manufacturing coke and it has this gas as a residual?

A. That is right.

Q. Now, in a coke company of that kind, a ton of coal produces in round numbers say 10,000 cubic feet, doesn't it, speaking roughly?

A. No. In the coke oven plant it produces about 4,000 feet. That is of a proper quality for sale; but in a coal gas plant you are right.

Q. In the New England Coal & Coke Company do they not produce about 10,000 feet of gas with a ton of coal?

A. Not commercial gas for sale.

Q. I am not talking about commercial gas for sale. I say gas—10,000 feet per ton of coal. Is that a round figure?

A. I think not. 4,000 feet is the usual allowance of gas at coke oven plants.

3274 Q. Didn't you testify before the Gas Commision in response to my questions that the New England Coal & Coke Company produced roughly 10,000 feet of gas per ton of coal, and that 7,000 cubic feet of this was used to coke more coal, leaving about 3,000 cubic feet to go for illuminating purposes?

A. I may have said that. I do not recall exactly.

Q. You certainly did, or else I am much mistaken. Was that an error if you did state it?

A. I don't know how much they used for heating their retorts. All I know is the amount they sold.

Mr. Burr: Have you a reference to the testimony?

Mr. Mathewson: No.

The Witness: I don't know the amount of gas they produced. I know the amount which is commercially saleable, which is 3,000 to 4,000 feet per ton of coal.

Q. When you coke a ton of gas coal, is it not the fact that in round numbers you produce about 10,000 feet of gas?

A. Yes.

Q. And if this New England Coal & Coke Company delivers 4,000 feet that would indicate that they had used about 6,000 feet for their own purposes of coking more coal, wouldn't it?

A. Yes, but when I say that amount of gas, 10,000 per ton of coal, I refer to the commercial coal gas process. I am not sure just how much gas they do get out of the coke ovens because it has never been a matter of report to any commission; it has never been a matter of investigation so far as I have been able to trace it. It is quite likely true that they get 10,000 feet. It is not a matter I am very positive about. They refused to let anybody go through their plant in Everett.

3275 Q. You say you have been a statistician and studied the gas business and other things in the City of New York and you know that a ton of gas coal produces about 10,000 feet of gas, do you not?

A. It does in commercial coal gas; perhaps 10,000 to 11,000.

Q. Have you any idea less gas is produced in coking their coal at the New England Coal & Coke Company?

A. I don't know.

Q. You don't know that there is any difference, do you?

A. No.

Q. And do you know that about 4,000 feet of the gas that they produce is delivered commercially to the City of Boston or the companies they are operating?

A. And I do know that they could not deliver 10,000 feet of ordinary commercial coal gas.

Q. No, because they have to use part of the gas; they use it to coke more coal and to keep their own business going.

A. I understood they did not produce of commercial quality, 10,000 feet in coke oven plants, but maybe 10,000 feet of some kind of gas.

Q. Do you know at what figure they are able to deliver that gas to the Boston companies?

A. I know what price they do deliver it at.

Q. Well, what is it? I think you stated before the Gas Commission that it was fifteen cents unpurified, or something of that sort, was that right?

A. I have here the figures for the year just closed.

Q. Where did you get those?

A. From this copy of schedule just made to the Massachusetts Gas Commission by the Consolidated Gas Company of Boston, in which it tells how much gas it made, how much it bought, how much it paid for it, and so on. Now, they bought 2,262,654,700 feet.

Q. That is considerably more than one-half, isn't it, of their total output?

A. Their total output? It is. Their total output is
3276 3,988,188,700; so it is 55 per cent.

Q. That includes about 500,000,000 cubic feet sold to other companies?

A. They buy it first and then sell it afterwards.

Q. But the 3,988,188,700 include about 500,000,000 sold to other companies?

A. It includes 432,040,070 feet sold to other companies.

By Mr. Burr:

Q. You mean they buy it from other companies and sell it to other companies?

A. Yes. They do not sell as much as they buy, but sell about one-fifth of what they buy.

By Mr. Mathewson:

Q. What do you find they paid for that New England Coal & Coke Company gas?

A. 23.01 cents per thousand.

Q. That is the total cost?

A. Yes.

Q. That was 19 candle power, as you say—about that?

A. I did not say it was that candle power. I do not think it is. I said that the mixture of what they bought and what they sold had an average test according to the State tester of 19.37, but I did not say that what they bought was that. It is not. It is not over 15.

Q. How do you know it is not?

A. Because the testimony that came out in connection with the gas hearings, if I recall correctly, was that this gas was commercial coal gas.

Q. Didn't you testify before the Gas Commission that the cost to the Boston companies of this New England Coal & Coke Company gas was about fifteen or sixteen cents, but that there was additional
expense put on to treat it afterwards, and isn't this twenty-
3277 three cents which you refer to here the cost of the gas after
it has been raised to the candle power required by law?

A. I think it has been purified, and probably some oil, but I do not believe it has been raised to the average of 19.37.

Q. You do not know, do you, Professor?

A. No, not positive, but that is simply my impression, that it was mixed with the other gas before that candle power was reached.

Q. Well, what did you find the cost at the station was of the gas that this company manufactured itself at Boston?

A. 42.05.

Q. That is very much in excess of the cost at the station of the Consolidated Gas Company's gas, isn't it?

A. Yes, they make it under very much greater difficulties than you do. They have to mix it by "fits and starts."

Q. And it costs very much more, too, doesn't it, about ten cents more?

A. But the average cost of the whole is about the same.

Q. Well, that is another proposition. The company's gas which it manufactures itself costs nearly ten cents per thousand at the holder more than the gas of the Consolidated Gas Company in New York, according to the reports, didn't it?

A. Yes.

Q. Now, don't you know that the New England Coal & Coke Co. which produces this low priced gas as a residual product and delivers it to the Boston companies, gets its coal, alongside, from Nova Scotia; and I think you testified before the Gas Commission at $1.95 a ton?

A. There was testimony to that effect brought out by some investigation, but I never, I think, knew the price except as I have heard it.

Q. You have no reason to doubt it—you have heard it generally?

A. I don't know what the price was covered by these figures
3278 for that year. I have heard it, but I was unable to get official
information on it.

Q. You have no information it was different from $1.95?

A. My impression is the $1.95 was first brought to my attention in the examination six months ago.

Q. And you testify that was your information, don't you?

A. I don't recall what I said.

Q. Don't you?

A. I don't remember that I said I had any information.

Q. I suggest you look it up.

A. Cannot you look it up for me?

Q. Isn't it your information that the New England Coal & Coke Company, when you were testifying in Boston, was paying about $1.95, alongside, for coal?

A. It is my impression that there was no testimony given on the subject, and none ever given by the Company, as the Company said it was not a corporation and refused to give information.

Q. But you have based your testimony here on what you learned and heard, didn't you? Don't you remember it was said it was about $1.95 a ton?

A. I don't remember anything but what you said?

Q. Didn't I ask you if it was not about $1.95 and you said that that was your information?

A. I don't remember. That is the coal from Nova Scotia with a great deal of sulphur in it.

Q. But a very rich gas coal?

A. Yes.

Q. As a matter of fact that coal was delivered to the New England Coal & Coke Company according to your information, was it not, and to no other Company in the city of Boston, because the same interests that controlled the New England Coal & Coke Company also controlled this Nova Scotia coal mine; is that right?

A. Your question has too many questions in it for me to answer it.

3279 Mr. MATHEWSON: Well, the stenographer will read it.
(Question read by stenographer.)

The WITNESS: Shall I tell you how many questions there are? You ask me the price, and whether delivered to any other Company, and to state that it was for a certain reason. There are three different questions. Which do you want answered?

A. I cannot answer them all by the same answer.

Q. Well, answer them all in detail then without answering them together.

A. I believe that the interest that owned the plant at Everett owned the mines from which they get coal in Nova Scotia. I believe to the best of my knowledge there are other mines in Nova Scotia situated near it of about the same quality, but the price obtained in Boston for that coal I am ignorant of.

Q. But, I am going to read your testimony now before the Gas Commission and see if you have any further corrections to make. I read from about the middle of page 1325, as follows:

"Q. You stated in Chicago if I read your testimony correctly, that about a third of the gas delivered by the Boston Companies was not made by themselves, but that they bought it? A. Yes.

"Q. Isn't it a fact that, according to the testimony last year in Boston, about 1,800,000,000 feet out of 3,000,000,000 feet distributed was bought; that is to say, was what was known as the New England Coal & Coke Company gas, which is produced as a by-product by that Company, which is a Coke Company? A. I have here the exhibit which shows that there was purchased about 1,600,000,000; in other words, about one-half of that they used for fuel.

3280 "Q. About one-half in the past year? A. Nevertheless, their cost——

"Q. I am just asking you whether that is a fact, Professor? A. Yes.

"Q. I am coming to that later about the cost; do you know what the New England Coal & Coke Company, which produces this gas, sells it to the companies for in Boston, I mean at what price? A. 15 cents; but it has to be purified a little afterwards.

"Q. Do you know what it costs to purify it? A. I had those figures, but I do not have them with me.

"Q. Could you make a general estimate? A. Oh, perhaps two or three cents, but ordinary purification does not cost that, but I think there are expenses in connection with the pipe line amounting to that much.

"Q. Let me ask you this, as I understand it, and you will correct me, if I am wrong, the New England Coal & Coke Company is a company whose main business is the production of coke? A. Yes, sir.

"Q. For the production of coke, it produces, we will say, from each ton of coal, about 10,000 cubic feet and about 7,000 cubic feet out of 10,000 feet produced per ton of coal is used to coke more coal, and about 3,000 cubic feet is transmitted to the pipe line company, which purifies it and delivers it to the Boston companies to sell as gas? A. From 3,000 to 4,000 feet.

"Q. So that only about one-third of the gas which this New England Coal & Coke Company produces really goes to illuminating purposes? A. Yes.

"Q. The rest, about 7,000 feet out of 10,000 produced per ton of coal is simply used by the New England Coal & Coke Company to coke more coal? A. Yes, sir. 3281

"Q. It cannot furnish and does not furnish, therefore, enough to the Boston companies to supply all their consumption, so that the Boston companies make about as much more? A. Yes.

"Q. Now, as a matter of fact, don't you know that the New England Coal & Coke Company was owned by the same interests that controls the Dominion Coal Company in Canada, and that the Dominion Coal Company accordingly delivered gas coal to the New England Coal & Coke Company in Boston for $1.95, alongside? A. About that.

"Q. And they do not deliver coal to anybody else in the City of Boston for gas purpose at that price, do they? A. No."

Now, do I correctly quote your testimony?

A. Yes. And it may be I had in mind some statements that President Richards may have made about that coal, but I don't remember it now.

Mr. **Burr**: He did not suggest the figure in that testimony you just read, Mr. Mathewson. You did.

Mr. **Mathewson**: I asked him if it was not that and his answer was "about that."

The **Witness**: It looks reasonable. It should be about that and it may be at that time I had some recollection. I don't know now about any recollection.

Q. If you so testified at that time, that was the best information you had at that time, wasn't it?

A. Yes. It applied to a previous year, not to this current year.

3282 Q. Now, as a matter of fact the *coal* which is produced by the Boston Gas Company itself and is not obtained from the New England Coal & Coke Company is produced from coal which comes from other sources, the same as we get our coal in New York from other sources, isn't it?

A. Yes.

Q. And the cost in the holder of the gas which the Boston Company itself manufactures is, you have stated, about 42 cents?

A. Yes.

Q. Now, let me ask you whether it is not so that in the cost of gas local conditions govern and that you must take each place and figure it out on its own basis as to cost of material, cost of distribution, salary, wages and other things?

A. You will have to do that largely but you can be greatly helped in forming your judgment of good management by your knowledge of what other companies are doing.

Q. Did you not in Boston before the Gas Commission testify in this manner (page 1336 of the record before the State Gas Commission):

"So that, when you come right down to it, as I think you said in some other place, you must, to get exact data, take the particular place under consideration, and devote yourself to the local conditions there? A. That is right. I was only trying to establish a general rule, but there are always exceptions to all rules."

A. Yes. Now, you just read a long quotation from my testimony. I want to call the Master's attention to the fact that I did not there refer to whether the gas obtained from coke oven plant was enriched in candle-power or not before it was delivered over to the pipe line, but what I did refer to was its being somewhat further purified. I am not sure as to the enrichment even now, but you formed the
3283 impression I think that I had testified as to its enrichment. What you quoted there only referred to purification.

Q. Now, in view of the difficulty in getting this thing down on the record I am going to read further from the Gas Commission record while I have it before me, and ask you to say if this is an exact quotation of your testimony before the New York Gas Commission? I read from page 1336 as follows:

"Q. Now, in 1897 you testified in Chicago, if I am correct in my " assumption, that ninety cents was a fair price for gas in the City of " Chicago? A. I don't—that was brought up in a hearing in Chi-

" cago the other day. I don't know what it referred to, as I didn't " give any testimony in 1897, and I never gave testimony in the Chi- " cago gas case—oh, I thought—yes, it was a hearing in Springfield, " not in Chicago.

"Q. But relative to Chicago? A. But relative to Chicago, yes.

"Q. Ninety cents. Now, isn't it a fact that, since 1897, both labor " and material have risen? A. Yes.

"Mr. DeFord: Now, I would just like to ask with respect to what " part of the direct examination is this cross-examination? He has " made no statement here as to what it would cost to produce gas " here, and he is asking what he testified concerning the cost of pro- " duction of gas in Chicago, at a Springfield hearing in 1897. It " seems to me remote and not proper cross-examination.

"Mr. Mathewson: I do not think it needs much argument on " that proposition. You have asked him about Chicago distribu- " tion and one thing and another in this case, and, besides 3284 " that, I propose to show what he testified, that in one city " ninety cents was proper in 1897, and labor and material " have risen since then. I think, to test the witness' observations " and the value of them, all these things are proper.

"The Witness: I would like to explain to the Commission the " fact, that, in 1897, when this testimony was given, I had not made " much study of the Chicago gas companies. I did not know any- " thing about their real costs of material, if I recall correctly, and it " was pretty largely an estimate based on a guess, as you might say. " I don't remember that the company had ever produced any accu- " rate data. Soon after that, however, I did come across a report of " a Chicago gas company to the New York Stock Exchange.

"Q. But, professor, at the time you delivered this testimony, then, " that you thought ninety cents was a proper figure in Chicago, you " say it was only a guess, and you have no data to proceed upon? " A. I didn't say I had none, but I don't think I had accurate data " of the cost of oil and coal.

"Q. You said a moment ago it was only a guess, did you not? A. " Yes, to a large degree; that it was based on some evidence, I insist " on. But I say it was not based on as much evidence as my later " testimony in Chicago, or the later testimony I have been able to " give in other cases. I had not studied the subject then as much as " I have since, but I think I ought to say that I later found a report " of the Chicago companies to the New York Stock Exchange, when " they were issuing some securities."

3285 If you have any doubt about my having accurately read it, I wish you would note it any say whether I have or not.

Mr. Burr: You have accurately read it.

A. I believe you have accurately read it.

Q. You stated there that labor and material have both risen since 1897, when you testified that 90 cents was a fair price in Chicago, and even the last year you have gone to Chicago and testified that less than 60 cents was a proper figure, is that right?

A. I do not recall about less than 60 cents.

Q. Was your estimate a year ago in Chicago when you testified there above 60 cents as the cost of gas?

A. Do you refer to this pamphlet?

Q. I refer to your estimate to the City of Chicago, as shown in the pamphlet to which we have all referred.

A. Will you point out the page?

Q. No, I merely asked whether you did not give an estimate to the City of Chicago a year ago which was less than 60 cents in spite of the fact that the material and supplies have both risen since 1897?

A. I don't remember. I don't find anything here. I may have referred to the operating expenses, but I don't know what you refer to, and in fact, I may say that I have since then been trying in every way to see what the testimony in 1897 in Springfield was and I could not put my finger on it or find out if there was any authority for saying that I stated 90 cents, except Mr. Mayer's implication when he was cross-examining me in Chicago. I took it for granted he had the evidence there before him and I did not remember it and assumed he was quoting it correctly just as I have in this case frequently assumed you were quoting it correctly, but I had no personal recollection of it.

3286 Q. I merely asked you before the Gas Commission if this testimony is correct, whether you did so testify and you replied as the record shows, didn't you?

A. I did, but I do not think it is what you find; it changed a good deal since then and I cannot put my finger on what I said or when.

Mr. Burr: And it does not say it here in the testimony. You claimed he said 90 cents.

Mr. Mathewson: I will let the testimony speak for itself.

The Witness: I think it was because of my too readily assenting to a suggestion on cross-examination in Chicago.

Q. And do you remember in Mr. Cowdery's statement, in his estimate to the Committee on Gas an- Electric Light of the Common Council of Chicago, "There are no two places probably in the United States where conditions are same," referring to the cost of production and distribution?

A. I don't remember, but I should prefer to believe they were not absolutely the same.

At 4:25 P. M. adjourned to October 24th, at 12 o'clock.

Last Exhibits:

Complainant's 256.
State's W.
City's 59.

3287 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIEN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *October* 24, 1906—12 m.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

3288 Mr. BURR: On page 3267, in my remark on that page, the word "custom" should be "question."

EDWARD W. BEMIS resumes the stand.

Cross-e-amination by Mr. MATHEWSON (continued):

Q. Referring to the Chicago report to which the City counsel referred, and upon which we have commented from time to time, it appears that statements were presented by yourself, Doctor Humphreys and Mr. Cowdery. That is çorrect, is it not?
A. Yes.
Q. Now, as to you and Doctor Humphreys we know. It appears from this pamphlet, page 8, if it is correct, that Mr. Cowdery has been connected with the gas business for thirty years, that he commenced with the Toledo Gaslight & Coke Company of Toledo, tha in 1877 he went from there to Milwaukee, where he became assistant superintendent; that from 1882 to 1884 he was connected with the People's Gas Company of Chicago; in 1884 he returned to Milwaukee and became superintendent of the plant——

Mr. BURR: What is the object of all this description of Mr. Cowdery?
Mr. MATHEWSON: I am just calling attention to Mr. Cowdery's experience, and then purpose to ask some questions as to Mr. Cowdery's views and ask this witness if they affect him, after showing his qualifications.

Q. (Continuing:) and subsequently general manager, remained there until 1903, when he took charge of the Laclede Gas Co.'s property in St. Louis, and it appears on page 8 in his statement that he has been interested with others in the purchase of gas 3289 properties and their improvements, building up their business, and so forth, including the plants at Racine, Kenosha, Fond du Lac, and other Wisconsin cities, and I quote from his statement as follows:

"During those thirty years it has been my duty as well to cover the country thoroughly to know what other gas companies were doing, to become acquainted with the men operating those companies; and during that time I believe I have become pretty well acquainted with practically all of the men operating gas properties in the United States, and I am familiar more or less with the conditions that govern the different properties throughout the country. I have been connected with the gas associations of the country for ever twenty years. In 1892 I served as president of the Western Gas Association, an association which is supposed to incorporate in its membership practically all of the gas men operating gas companies throughout the Middle States. I have just served during the last year as president of the American Gas Association, which is the national association of America and supposed to embrace all of the gas men of the United States. I was for one year president of the State Association of Wisconsin."

Now, in the questions which I asked you yesterday as to Mr. Cowdery's statements and views and as to your concurrence therein, were you familiar with Mr. Cowdery's experience and practical work in the gas business as he has recited it?

A. I had never met Mr. Cowdery until I was introduced to him during that week, but I have seen his name as connected with the Milwaukee company, particularly, and later with the St. Louis Company.

3290 Q. You have no doubt, I suppose, that the statement of his experience which I just quoted is true?

A. I know nothing about the other companies except what you have read that he stated. I do have other information that he was connected for a long time with the Milwaukee and St. Louis companies.

Q. You have no reason to doubt the accuracy of his statements, have you?

A. I have no reason to doubt the accuracy of what you have just read, as to his being connected with these companies, but at the same time I have no information either way, only I suppose that he would not give any inaccurate information on such a thing, but I cannot speak from any knowledge.

Q. Now, it appears that this committee of Chicago, in their report (page 3), referring to you, Mr. Cowdery and Dr. Humphreys, employs the following language:

"In selecting these three men your committee had in mind not only the obtaining of the best authorities on the subject, but authorities who would represent every phase of the subject. Professor Bemis was selected as representing the theoretical side of the question and that phase of it which is antagonistic to private control of public utilities and strongly favorable to municipal ownership. Mr. Cowdery, as one who for many years has been actively engaged in the construction and management of gas plants. And, lastly, Mr. Humphreys, the head of a great technical school and the leading consulting engineer of America and Europe on the subject of manufacture and distribution of gas, as one who would present the subject from a wholly impartial standpoint, simply as a great engineer."

3291 Is that a fair statement of your position, as representing the theoretical side of the question and one that is antagonistic to private control of public utilities and strongly favorable to municipal ownership?

A. A little exaggerated.

Q. The Committee in their report say of you, "He approached the subject wholly from a statistical standpoint." That is correct, is it not, in that you had no personal experience in operating gas plants in Chicago or elsewhere?

A. I have had no personal experience, as I have stated in this case, in the operation of gas works; but I do not say that I am antagonistic to well-regulated, privately-managed gas works. I think that more and more the movement will progress toward municipal ownership, but I do not take the ground that all privately-owned gas works are to be tabooed or outlawed or treated unjustly.

Q. I see that Mr. Cowdery (page 10), referring to the fluctuations of as much as five cents per thousand in cost within two years, adds: "In trying to fix the price for gas you must not take too narrow a view *for* it and therefore take the lowest possible cost in any one year as a basis. You must take into consideration the fluctuations in the prices of oil, fuel and labor, and make due allowance for such changes."

You will concur in that, will you not?

A. Subject to one qualification; that the general tendency of costs, as I have found in sixty odd Massachusetts companies, has been downward.

Q. But the general tendency of labor and material, as you have also stated, has been upward?

A. Yes, but despite that fact, the statistics of the sixty odd Massachusetts companies, tabulated as one company every year in the returns of the Commission, shows a tendency downward.

3292 Q. But the lower you get the less room there is for a further drop?

A. Well, I would not say that.

Q. Don't you think that it is so? There must be some limit below which you cannot expect companies to reduce the cost of gas, and the nearer you approach that limit the more serious the question becomes, doesn't it?

A. Why, in fact, there is a limit at the present time. That limit is a fluctuating one, with the progress of the art.

Q. Mr. Cowdery also states (page 10), that whether water gas is cheapter than coal gas in manufacturing is a question of locations and conditions entirely. That is the fact, is it not?

A. As to whether coal gas or water gas is more economical?

Q. No; whether water gas is cheaper in manufacture than coal gas, is a question of locations and conditions entirely?

A. Yes.

Q. On page 13, Mr. Cowdery also says:

"The only way that one can get at the proper cost in any particular place is by making a careful investigation in that particular place and by taking all the conditions into consideration that exist there."

Do you concur with that proposition?

A. That is one of the things to be undertaken, but there is always great room and reason for judging of the efficiency in one plant by one's knowledge of good practice elsewhere.. The two are well put together, or would be.

Q. But you would not feel that it was proper to fix the price of gas in any particular place through your generalizations until you had made a careful investigation of the conditions and costs there?

A. I have urged that that should be done in all cases. I have urged in this case for accounting and engineering investigations to supplement others.

3293 Q. Now, Mr. Cowdery further says (page 15), that

"The repairs and renewals that take place frequently should be charged to the repair account as they come along, but those that take place at infrequent intervals should be provided for by a reserve fund."

Is that substantially the view that you have taken and that you understand has been taken by Dr. Humphreys, that what is called final renewals should be taken care of by the reserve fund, and current renewals and repairs should be charged to the current repair and renewal account?

A. I understand Dr. Humphreys to provide that this whole thing can be put under the renewal fund and spent from time to time. That is what I understand his testimony to be. A sinking fund provision would rather look forward to a fund set aside as a sinking fund would be, and I have suggested that that was to me a simpler and more scientific method of treatment. But it can be done in either way. I think this *this* company has been doing it as Dr. Humphreys has suggested, in the way of a renewal fund.

Q. You stated, it appears at page 20, that coal and oil were cheaper in Cleveland than in Chicago, and you also said "labor also is cheaper in Cleveland" than in Chicago. Is that a correct quotation, or is that the fact, as you understood it?

A. I suppose I stated, if it appears there—you ask me now do I think it is true that labor and oil are cheaper?

Q. I asked you whether it is a correct quotation of your statement? I suppose that to be the fact myself; I am not questioning it at all.

A. I have an idea that that is true, but as to oil there was not ever given in this hearing a statement about the cost of oil per gallon in Chicago.

3294 By Mr. **Burr**:

Q. Which hearing?

A. In the hearing before the Chicago City Council.

By Mr. **Mathewson**:

Q. But, assuming the cost of oil in Chicago to have been what you assumed it to be and what we have assumed it to be in the testimony here, according to your best information, you stated the other day that the cost of oil in Cleveland you now understood to be cheaper than in Chicago?

A. Yes, but I am not positive about the Chicago price.

Q. Now, taking up the subject of returns on capital. I want to ask you at the outset on what theory of valuation of capital you compute your return? Is it the original cost of the property? Is it the cost of reproduction now, or what is it?

A. It is any investment in the gas business. I say any investment in the gas business in the shape of stock or bonds can be floated on a six per cent. basis.

Q. No, I am getting away from paper and taking the substance. I do not care how much paper there is out representing the property. For the moment, I ask you whether you compute a return in your estimate upon the structural value of the property as it exists, or upon some other basis of valuation of plant and property?

A. My testimony was based solely on the way the securities sold in the market of all the leading companies east of the Mississippi River, without regard to whether that stock was larger than any particular theory of valuation or not. It was based solely on the dividends and interests of said securities as related to the market price of the same.

Q. But you have testified that you took six per cent.?

A. Yes.

Q. In your computations?

A. Yes.

3295 Q. And you have computed six per cent. on some valuation and have added the number of cents per thousand that that computation produces to your assumed cost of gas to reach the proper selling price for gas? Now, I want to know upon what you computed your six per cent.?

A. Yes. I understood you were asking me how I got the figure or six per cent. I will tell you. I used in my table as a matter of computation——

By Mr. Burr:

Q. Speaking of Table 16, page 3052?

A. Yes. I used in Tables 16 and 17 (page 3052) I used, as will be noticed, three or four different estimates of capitalization, and showed what six per cent. would be upon each.

By Mr. Mathewson:

Q. You expressed no view or preference then, nor did you establish any theory of valuation of property on which you were to compute the six per cent.?

A. I may not have done so. I have a theory and should have expressed it. It is quite likely I did not. Well, whether I did or not will have to be determined by the testimony.

Q. Now, on what basis of value of capital did you compute your six per cent. in procuring what you call the proper selling price for gas?

A. First, original cost of land now in use, after deducting land sold or no longer in use in the gas business. Second, original cost of mains and services that are now in use. Third, present structural value of the rest of the property necessarily used in the conduct of the gas business, such as buildings, machinery, holders, meters, supplies on hand, necessary working capital, which I assumed, as 3296 Mr. Carter had testified in the previous case before the State Gas Commission, at about a million dollars.

Q. Oh, no, he stated three million dollars, but arbitrarily divided it into a million dollars cash and two million dollars outstanding. Do not forget that. In addition to working material, which was $616,000 more.

A. I allowed the $616,000, and I allowed the million, and I made reference to the other two million dollars as the amount due the company, but there was no interest computed on it. Now, the present structural value which I have described or named is, in my opinion, to be determined by engineering investigations such as are now being made on the one side by the City and State engineers, and such as have been made on the other side by the engineers of the company, taking into account the cost of duplicating that property at present prices, and taking into account the present age and condition of the said property and its prospect of continued use. If, for example, a lot of that property is about to be discarded, as was asserted in the returns to the State Tax Commission, then a very low value——

Mr. Mathewson: I move to strike out "as was asserted in the returns to the State Tax Commission."

The Witness: As asserted in the evidence relative to those——

Q. Do you refer to the evidence in this hearing, before this Master?

A. This hearing and the State Gas Commission, that the value had been reduced very largely because of the prospective abandonment.

Mr. Burr: There isn't any question about that, is there?

3297 Mr. Mathewson: Yes, there is a great question. We do not intend, as far as I understand, to replace a single gas plant at Astoria if this 80-cent gas act is sustained. We could not afford it, could not think of it for a moment. That is pretty nearly in evidence.

Mr. Burr: No, it is not.

Mr. Mathewson: All this testimony the Professor is referring to is while the charge for gas was one dollar.

The Witness: I was not determining what you were to do with that property, but I say the facts bearing on that must all be taken into consideration in fixing the structural value. That is what I meant to say.

Q. Very good. Now, let me ask you a question right there. If you were going to reduce the value of the plants in Manhattan on the theory that they are going to be abandoned and the Astoria plant substituted for them, you cannot avoid substituting in place of these Manhattan plants the value of the Astoria plant, can you? You cannot discard one without including the other, can you?

A. I could not answer you that without an explanation.

Q. Well, it seems to me you can a-swer it and then explain. In other words, if you propose to discard part of the value of the Manhattan plants on the ground that they are to be abandoned, can you logically avoid including in the property the value of the Astoria plant which would be in existence when the Manhattan plants are abandoned and which will take their place? Cannot you answer that directly and then explain, if you please?

Mr. Burr: Do you mean included in the Consolidated?

Mr. Mathewson: I mean included in the value of the 3298 property, a return on which must be taken into consideration when you are fixing the price at which the gas produced by those plants goes to the consumer. I do not care how you figure it out as a mathematical proposition.

Mr. Burr: It is a different entity at Astoria, and a different corporation.

Mr. Mathewson: Oh, well, that makes no difference.

A. The valuation of the Consolidated would certainly be an independent valuation. I would not assert that when the plants are abandoned that there would not be necessary other capital to take their place. I believe that it would be necessary, and productive capacity, to take their place.

Q. Can you then reduce the value of the Manhattan plants in your estimate upon the assumption that they are to be replaced by other plants without at the same time including the value of those other plants which are to be substituted, and if so on what possible theory?

A. The valuation of the Astoria plant to me is an entirely separate proposition. When it comes to manufacturing gas, it will have to be reckoned with.

Q. But you are anticipating now when you say you would reduce the value of the Manhattan plants on the theory that they are going out of the manufacturing business; you are anticipating there. Can you anticipate in that way in reducing the value of the Manhattan plants without anticipating also by including the value of the plants that are to be substituted for them at the same time?

Mr. Burr: I think we shall contend that if there is any loss by reason of the removal of these plants to Astoria, the construction of new plants in Astoria for the Astoria Light, Heat & Power 3299 Company, that the loss should not be sustained by the consumers in the Borough of Manhattan, but must be charged up to the corporation known as the Astoria Light, Heat & Power Company.

Mr. Mathewson: That is not the proposition. The proposition which is now advanced is that the value of the plants in Manhattan will be reduced in some way on the theory that they are going out of business, but that nothing will be included for the value of the plants which take their place when they do go out of business.

Mr. Burr: What plants take their place?

Mr. Mathewson: We won't argue on that now, Mr. Burr.

Mr. **Burr**: The Astoria Light, Heat & Power Company's plants take their place, if any.

Mr. **Mathewson**: We may absorb the Astoria Light, Heat & Power Company before that occurs; and it may be a single corporation, for aught you know, if that was of the slightest importance in the discussion.

Q. (Question repeated.)

A. In my computation I did not cut off that loss of value connected with removal to Astoria. I contemplated no reduction in the value of the plants on the Island of Manhattan, except such reduction as engineers now studying the subject would find to be their actual depreciation, taking into account the present state of the art, and the relations of these plants to it, and their efficiency; based also on their location; but I did not take that position which I understood to have been taken, by the evidence, as a justification for a return to the State Tax Commision, namely, a scrap value, for half of the duplicable property on the Island. I did not do that. I have said—I think I made that clear.

3300 By the **Master**:

Q. Well, have these engineers reported?

A. They have not reported yet. They are still at work, by permission of the Court.

Q. Do you understand they have decided what they are going to report in advance of completing their investigation?

A. No, I do not. I have not said that I did, have I?

The **Master**: No, but I wondered if that was so.

By Mr. **Mathewson**:

Q. But you advanced the theory a few moments ago that in estimating the value of the Manhattan plants you would take into consideration the probability of their continued use or their early abandonment, and that was the occasion of my asking you how, if you are going to reduce their value by reason of that, you logically avoid including the value of the plant which will be substituted for them to the same degree, and if there is any logical reason I would like to know what it is.

A. Well, my thought in that statement a few minutes ago, was that there should be two valuations by the engineers, one with reference to the present efficiency of the plant, and the other with reference to the removal to Astoria, and I had not in mind to settle the question as to the relative weight to be given to those two points of view, but in my own computations I have taken the view of the valuing of the properties on the basis of their efficiency and not on the basis of any scrap value.

Q. In fact, you have discussed here the probability of the production of the coal gas at Astoria cheaper than the production of the coal gas in Manhattan and have based on that an argument in 3301 favor of the probable reduction in the station cost of all the gas, have you not?

A. Yes, sir, I have fully taken that into consideration as to the coal gas plants.

Q. You cannot take that into consideration on the one hand and then exclude the Astoria plant from consideration on the other when it comes to a consideration of capital, can you?

A. I could not, but I did take both into consideration in this way, that the economies that could be affected by an up-to-date plant, whether at Astoria or elsewhere, I would not undertake to say, ought to return in a short time—not the first year necessarily—six per cent. on the investment. But I did not presume to pass upon the wisdom of the selection of Astoria.

Q. I understand. Now, let me ask you another question on this Astoria proposition. The consumers of gas produced at Astoria must in some way pay a sufficient amount to make a return upon the investment at Astoria, must they not?

A. In the course of four or five years; not necessarily the first year.

Q. Well, directly or indirectly——

A. Yes.

Q. The consumers of gas produced by the Astoria Company must pay a return on the investment at Astoria which produces that gas.

A. Yes, I should say the average for the next ten years should be six per cent.

Q. I did not ask you about rates.

(Question repeated.)

A. I must qualify even what I stated, provided the Astoria investment was a wise one, which I will not undertake to determine. If it was an unwise one, there is nothing in the law of nations or fate by which we should guarantee them any return.

3302 Q. Then if gas is produced at Astoria and is consumed by consumers, they don't have to pay anything for their gas as a return on capital, provided the investment at Astoria is an unwise one; is that the proposition?

A. That is the law of business.

Q. That is your proposition?

A. Certainly, unwise investments are failures always in all businesses.

Q. Do you mean to say that consumers receiving Astoria gas, if it is sent out by the Astoria Company and sold to them, and is produced at reasonable prices at Astoria, that the consumers of that gas will not, under all circumstances in law, be compelled to pay a return upon the capital that produced the gas, assuming that the capital was invested at not excessive amounts?

A. If they have not made a wise investment they certainly will not be able to sell their gas at all.

Q. That is another proposition.

Mr. Burr: That is what you mean, is it?

The Witness: Yes. They would fail up for lack of a market.

Q. We will have to take our chances about failing up. You are not under that burden.

A. It is the same proposition as the New England Gas & Coke Company.

Q. Let us see if it is. If you treat the Astoria Company as separate from the Consolidated Company, then the Astoria Company is entitled to charge to the Consolidated Company, to which it delivers its gas, the cost of the gas, plus an amount sufficient to make a proper return on the Astoria investment, is it not?

A. Depending on whether the Consolidated Gas Company can do better in its own works. It is not obliged—if they are separate corporations, as your questions ask, the Consolidated Company is not obliged to buy it.

3303 Q. Supposing the Consolidated Company does buy it or any other company buys it, Company A, B or C?

A. Yes.

Q. The Astoria Company is entitled, if it makes gas at a reasonable and prudent rate, to charge in selling the gas the cost of the gas, plus enough to return a proper rate of interest upon this prudent investment in the production of gas, isn't it?

A. If it is a rational investment of capital; otherwise not.

Q. We will assume it is.

A. That is the point I was making all the time.

Q. Let us go a step further. The Consolidated Company then would get the gas at the cost at Astoria plus an additional amount sufficient to make a proper return upon the investment at Astoria that produced the gas?

A. Yes.

Q. And that would have to be taken into consideration by the Consolidated Company when it fixed its price to the consumer, would it not?

A. Yes, so far as it bought any gas from the Astoria Company.

Q. Now, supposing the Consolidated Company owned the Astoria plant directly, it then would be entitled to the proper cost of the production of gas at Astoria plus an amount sufficient to produce a return upon its investment at Astoria, would it not?

A. Provided the investment was a wise one.

Q. So that in substance there is not the slightest difference whether the Consolidated Company owns the Astoria plant directly or whether the Astoria Company is a separate organization and the Consolidated Company buys the gas at the cost to the Astoria Company plus an amount sufficient to afford a fair return to the
3304 Astoria Company on its investment, is there?

A. Yes, I think there is a difference.

Q. Does it work out any differently in dollars and cents?

A. Yes.

Q. I should like to know how?

A. If the whole plant were owned by the Consolidated Company and you admit that it was a wise investment——

Mr. **Burr**: Wise and necessary investment.

The **Witness**: Wise and necessary investment, the Consolidated stockholders would be affected by the profits of that company from the start. If, however, it were an independent organization which was establishing a plant for the next, not two years but ten years and longer, twenty years and thirty years, in the growth of this city and Brooklyn, or Greater New York, in other words——

Q. But we have no franchises, you know, outside of the Island of Manhattan and Long Island City.

A. Well, the right to sell gas to other companies, I mean—if that be taken as an independent proposition, then its burdens for the first two or three years would not be borne by the Consolidated. The Consolidated would simply pay for the gas that it bought, and it might be that the Astoria Company, building for the future, might do wisely to look forward to no dividends the first two years, and then dividends that would gradually increase until ultimately they averaged six per cent. from the start. I should say it would make a difference to the Consolidated Company therefore.

Q. I am not talking about the Consolidated or the Astoria; I am talking about the cost of gas wherever the investment is, or whoever owns the investment, assuming it is a prudent one, and that the gas is produced at a fair price, the consumers of that gas must 3305 pay enough to afford a fair return upon the investment in addition to the station cost of that gas.

A. It must be such, assuming that the Astoria is built solely for the Consolidated consumers.

Q. Assume that, then.

A. I do not find anything in the evidence to prove that.

Q. Assume that, and then is your answer in the affirmative?

A. Read the question, please.

Question read as follows:

"I am not talking about the Consolidated or the Astoria, I am talking about the cost of gas wherever the investment is or whoever owns the investment, assuming it is a prudent one, and that the gas is purchased at a fair price, the consumers of that gas must pay enough to afford a fair return upon the investment in addition to the station cost of that gas."

Mr. **Burr**: That is the object of this action, to have that determined, is it not?

Mr. **Mathewson**: Not at all.

Q. Isn't that so?

A. On those assumptions, the consumers—all the consumers, not necessarily the Consolidated Company's consumers, but all the consumers of Astoria gas wherever located in the long run, would be, according to my theory, likely to pay and ought to pay a six per cent. return upon the investment.

Q. They ought to pay whatever is a fair return, ought they not?

A. Yes, taking that assumption, you understand, that it was a wise and necessary investment, and taking the further assumption that it is all the consumers of that gas and not merely the Consolidated consumers.

Q. Of course you understand from the evidence, don't you, that

the Consolidated Gas Company owns all the stocks and bonds
3306 and notes and securities of this Astoria Company?

A. Well, I could not put my finger for the moment on the evidence, but that has been my impression of the evidence. I think I have read it.

By the MASTER:

Q. Professor, you said that in figuring on the price of gas, you take the land at its original cost. Now, do you announce that as a general proposition or do you simply have in mind this particular case of the Consolidated Gas Company?

A. I asserted as a general proposition, upheld by the law and practice in Massachusetts and Great Britain as to all gas companies. I know of no exception to it in either Massachusetts or Great Britain in the last ten years.

Q. This Consolidated Gas Company, let us say, has paid dividends continuously, for some period. But suppose you had a gas company that for some reason had not paid any dividends for a few years but had skipped, say, for three or four years in dividends. How do the stockholders of that company get a return on the capital that is locked up in their real estate, if always as a general rule you are going to base the proper price of gas on the original cost of the real estate irrespective of any subsequent rise in value or any extraneous consideration whatever? Is that fair in your judgment?

A. Yes, the company that is declaring no dividend, would have the right, I suppose, to appeal to the State Gas Commission in New York State for the privilege to increase its price. That has been done in Massachusetts and it is done in England.

Mr. MATHEWSON: Well, it is not done here.

3307 The WITNESS: And they would have the right to show—
Gas has been increased in New York City after the gas war.

Mr. MATHEWSON: No, never by the Legislature or by any authority.

The WITNESS: Well, by the company. The companies would have the right to show not merely their dividends but their accumulated profits if it should appear that they had not declared dividends, because they had put the earnings into extensions of mains and holders, &c., that would have to be taken into account and would be considered a profit, though they had not divided it. But your question may not be answered fully, and if you mean to consider a company which has made no profits in any form, shape or manner, either by dividing them or by putting them into extension, and has simply done business without a profit for a series of years, is that the question?

Q. No, but I assume on a general proposition, that any capitalist who puts any money in the business is entitled to a return on his money. That you do not dispute?

A. No.

Mr. BURR: But you will bear in mind this is a public utility corporation.

The **Master**: Well, a man has some rights even if he puts his money into that sort of a company.

Mr. **Burr**: But assuming that function to the general public is a little different than the general proposition you have submitted.

Mr. **Mathewson**: Only to this extent, and it has been upheld by the decisions, that within reasonable and just limits, the rate of return may be governed; that is all.

3308 Mr. **Burr**: That is right, I agree with you.

Mr. **Mathewson**: Not as to the value.

Q. The only question to my mind is this, if you take an inflexible rule as I understand you do, a general rule that in getting at what would be the proper price of gas, and proper return on capital invested, you have to take real estate at its original cost, a case might arise where that would work injustice. I do not mean to say that is this case, but suppose you take a case where for some cause or other a gas company had been obliged to suspend its dividends for several years during which time the stockholders got no return on their investment at all.

A. I would say as to that that such a fact should be taken in consideration in connection with the price of gas. A Company would be treated very differently that had made no profits in any shape or manner than a Company that had, but that is not a question of valuing the capital.

Q. Then it comes back to the point that it is not an inflexible rule necessarily?

A. There are two questions to consider, first, the capital and next, the capital on which the profits are to be rendered. Now when I said that some consideration in fixing price so as to yield profits, should be given in a case such as you mention, I did not mean to say that I would change my theory as to determining the proper capital, only the proper price and the profits; but the capital, I do not see any exception to the position which has become an inflexible rule both in Massachusetts and Great Britain, that they cannot capitalize any increase in the value of land or any results of street paving.

Mr. **Mathewson**: We do not think that is a fair statement, either of the law of Great Britain or Massachusetts.

3309 Mr. **Burr**: Mr. Mathewson smiled at the suggestion of the Professor, that they might under those conditions, appeal to the Commission to raise their rates. The very object of this action here is an appeal to some future Legislature to raise their rate, if they are successful here, because the Court is not going to fix a new rate. The Court may say that this rate is confiscatory and unfair and unreasonable, but the Court will not fix what is a fair rate, and they have to appeal to another Legislature or another Legislature will take up the question of what is a fair rate.

By Mr. **Mathewson**:

A. I recall in the law the provision that a mayor of a city or the consumers of gas may appeal to the Gas Commission in the State of New York to fix the rate of gas. Do you know of any provision in that law authorizing the gas company who produces the gas to appeal to the Commission for anything?

A. I am not sufficiently familiar with the law to state. I think it is in the Massachusetts law.

Q. I think it is a very remarkable omission in our law. I do not find any such provision as that in it.

Mr. Burr: The old decisions say you can go back to the Legislature, and the new decisions say you must go to the Court.

Q. Now you lay down two lines of computation in reaching capital. You say so far as land and mains and services are concerned, you will take the original amount invested therein as your basis, but when you come to — plant, you will take, not the original amount invested, but the appraisal thereof to show the structural value at present. What logic is there in that proposition?

A. Before answering that, in order that my previous reply
3310 may be correct on the record, I wish to qualify what I said
about mains and services to this extent. I should take the original cost of laying the mains and services, but for the pipe itself, I should take the present structural value, just as I would of buildings and machinery and holders and meters; in other words, the duplicable property, as it were, should be taken on its present structural value, but the land value and the laying resulting from paving should be fixed at its cost originally. Now, coming to your question, as to why I make that distinction, I make it because I—I have described it I think in the case of paving a few days ago, in answer to the Master——

Q. No, you are getting beyond my question. Then I understand you now to say on reflection that the basis of capital upon which you compute your return is the cost of reproduction to-day except that you exclude the additional cost of paving, the additional value of the services and mains due to a more expensive paving, and exclude any additional valuation of land due to lapse of time and growth of the community. Is that right?

A. Yes, if you understand as to the rest of the property that it is the cost of duplication less the decline in its efficiency and value due to use and the progress of the art, to what I mean structural value.

Q. Structural value?

A. Yes.

Q. Structural value with you, then, means cost of duplication, of course taking into consideration the depreciation which has occurred?

A. Yes.

Q. And that was the basis which you assumed in Chicago, wasn't it, cost of duplication?

A. I had no data in Chicago as to the plant; there was no inventory and no engineering report, but I think I took an estimate of what a new plant would cost and took their statement that their plant was as good as new, and figured out an estimate there.
3311 But——

Q. Cost of duplication, wasn't it?

A. Yes, but I asserted in that statement that I made, wherein I think I took the figure of $3.20 per thousand feet, that should be subject to change on an investigation by engineers.

Q. Oh, yes, but the theory was cost of duplication?

A. Oh, it was that theory, yes.

Q. Now, we will assume that we have land in the gas business which cost $7,000,000; that it has increased in value, and meanwhile of course our taxes have increased as it has increased in value, until to-day it is worth fifteen million dollars in the market, and that we could sell it to-day for fifteen million dollars, and have the use of that money or that we could lease it on a basis of fifteen million dollars valuation, and that our manufacturing plants are properly on that land; now do you mean to say that it is your view that because the public is having the use of that land in a sense, that we are entitled to a return of only seven million dollars, while if we sold it in the open market, or used it for any other purpose, or leased it, we could get a return of fifteen million dollars?

A. You are assuming that this is all an increase in the land value?

Q. Yes.

A. Yes, I hold that they should not increase the price on account of the increase in the value of land.

Q. You hold then, that while anybody else might have to pay fifteen million dollars for the land, or while we could lease it to anybody else on a fifteen million dollar basis of valuation, that merely because the public is using it, we can get a return on only seven million dollars, when we could sell it for fifteen million dollars in the market; is that it?

A. I should hold——

3312 Q. Well, is that it or not?

A. As I understand your question, it is the same as I assent to.

Mr. Burr: You must also have the further fact in mind, according to the testimony in this case, that no better or greater gas can be made on the land that was purchased in 1884 than on the same land in 1906.

Mr. Mathewson: Yes, there is a great deal more, and very much cheaper, both.

Mr. Burr: On the same land?

Mr. Mathewson: Yes.

Mr. Burr: Because of the land?

Mr. Mathewson: No, of course not, there is no claim of that sort.

The Witness: That is what I assumed.

Mr. Mathewson: Our claim is that here is land that we are devoting to the use of the public and they are obliged to pay for it the same as any individual.

Mr. Burr: Used in the gas making business.

Mr. Mathewson: Certainly.

Q. Now, Professor, if the land should increase from something like five million dollars in valuation, which you have assumed from Mr. Yalden's report may have been the original cost in 1823, and from then on to fifteen million dollars and even one-third of that land were sold, that five million dollars would wipe out the entire investment in land would it not?

A. Yes.

Q. So that in that view you would allow no land at all and no return on land, in computing the capital upon which we are entitled to a return?

A. That is right.

Q. You don't think then if land increases in value, the capital of a company not being impaired at the outset, that that
3313 increase in the value of land forms a surplus which stockholders are entitled to?

A. I have not discussed the question of a sale of one company to another——

Q. No, I am not discussing it and do not want you to answer on that basis, because I did not ask you any such question.

A. No. But if the other position be taken, that the company is entitled to earn on the appreciation of its land, then to exactly the same extent has its operating expense been reduced, because you will have set that increase off against your expenses of operation; as long as the six per cent. on the original investment is kept, justice has been done and you can get your capital. The main point is that Wall Street will give you your capital, and that is all we need to know. The law of the market will give you all the capital you need on a six per cent. basis on that proposition.

Q. We do not think we can settle this on a Wall Street basis, but have to settle it on a business basis.

A. The United States Supreme Court has declared you could, in the Adams Express Company cases.

Q. If they did, you will not have to emphasize it with your own opinion. But do you think that a theory, which by an increase in the value of land very much less than is claimed, and I may say admitted in this case, to have been the increase in the value of the Consolidated Gas Company land, would wipe out the entire investment in land, is a possible theory to entertain?

A. Yes, and I maintain further that it is the practice in Great Britain and Massachusetts.

Mr. MATHEWSON: I move to strike that out. We have had it four or five times.

The MASTER: No, let it stand; it is a justification for his opinion, and I think he is entitled to have it appear there.

3314 Mr. MATHEWSON: Exception.

The MASTER: Let me ask another question, if you do not mind my interrupting.

By the MASTER:

Q. Suppose this land that Mr. Mathewson speaks about cost $7,000,000 originally, and is now worth $15,000,000; suppose the gas company in order to make the same amount of gas under equally advantageous conditions that they now make on this land would have to pay ten million dollars for a piece of land if they moved; what effect would that have on your scheme?

A. No effect unless the law compelled them to move because they were a nuisance or something of that kind. Then it would have an effect. The increase—if, for example, they were obliged to sell their own land and buy new, on account of their becoming a public nuisance, then any increased investment in land after selling their old land would become a legitimate charge on capital.

Q. Well then, would it not resolve itself into this, that if under existing conditions, to make a certain amount of gas, the necessary land on which to put your plant would cost ten million dollars, because a gas company bought this land a good many years ago when it was cheap, and they got it for seven million dollars, the public on your theory would get the benefit of that unearned increment, would they not? They would have the benefit of gas made on land that cost three million dollars less than any gas company starting in the market to-day, to manufacture gas, would save to pay?

A. Yes.

Q. That is about the size of it?

A. Yes.

By Mr. Mathewson:

Q. Supposing it were the case that by reason of rise in
3315 material and labor, it would cost to-day twenty million dol-
lars to produce the manufacturing plants which originally
cost certain companies ten million dollars, then you concede in fixing the price of gas you must take as the valuation of that plant, the cost of duplication which would be twenty million dollars?

A. I have in this case assumed that it has been the—there are certain reasons for criticising that, but I have assumed that any change, either a rise or fall in the value of material—pipe for example has fallen in the last thirty years, although not much since 1884; building materials may have risen; and so I would apply the rule in this case and I am applying it that you asked me about; but I realize there may be some objections to it.

Q. So the theory you are now applying is cost of duplication of property except land, but not cost of duplication of land?

A. And the same applies to paving as to land.

Q. Yes, but in the case of land, the city has not put any expensive pavement over that to raise the value, you understand, that is the mere natural rise of value due to the growth of community.

A. Partly due to public improvement.

Q. For which we probably paid our assessments in due course?

A. I don't know.

Q. Now, you said the other day that a purchase in the market was the best evidence of a proper return or of the rate of return which might be allowed——

A. Before you ask that question, may I make a further explanation of my last answer, or would you rather I wait until the redirect?

Q. If it is anything brief, I have no objection to it.

Mr. Burr: It is ten minutes after one. Do you want to stop now?

Mr. Mathewson: Let the Professor say what is on his
3316 mind, if he has something brief on that subject. I do not
want a long discussion.

The Witness: In conversation with the Massachusetts Gas Commission at different times I have found their theory has been——

Mr. Mathewson: I object to that. We have had conversations and we have letters and other things. Does he want to quote the Massachusetts Gas Commission? Why not bring them on here?

The Master: I think that is a little remote. I think you can explain what your own view is, but I don't know that what they told you is of very great importance.

Mr. Burr: And he may explain his reasons.

The Witness: I will change it and see if this will be less objectionable. In the decisions of the Massachusetts Gas Commission I have found that the companies in Massachusetts, the sixty odd companies, have not been allowed to capitalize any increase in the value of their buildings, even, or machinery, that has been brought about by earnings.

Mr. Mathewson: That is another proposition, and when we get to it we will see what earnings they do allow in Massachusetts. I think we are satisfied with that.

The Master: Shall we take the recess now?

Mr. Mathewson: I would like to have the Professor state the companies which he had in mind which he said sold bonds at par and above, for a five per cent. rate.

The Master: Did he not give that on the direct?

Mr. Mathewson: No, he only gave a few. In Table 14
3317 he gave certain companies as illustrations.

The Witness: Shall that come this afternoon?

Mr. Mathewson: I would like the whole list if you have them.

Mr. Burr: You have them, have you not?

The Witness: I think so. I have not them at my fingers' ends, but can produce them this afternoon.

Recess until 2.30 o'clock p. m.

After Recess.

Edward W. Bemis resumes the stand.

Cross-examination by Mr. Mathewson (continued):

Q. Continuing my question, I refer to the thirty-four cities which the witness mentioned at page 3017. I merely asked the names of them.

A. I had hoped to present it in tabulated form, but the stenographers were out at lunch, so I will simply be obliged to read from my notes.

Q. I did not ask for anything except the names of the cities.

A. I see. On bonds: Boston, Minneapolis, Montreal, Rochester, Newark (New Jersey), Paterson and Passaic, gas and electric, Peoria, Rochester, St. Paul, Syracuse, Troy, United Gas and Electric of New Jersey, Washington, Brooklyn Union, Buffalo, Detroit, Kansas City, St. Louis, Milwaukee, New York and Richmond, Chicago, Trenton.

Q. Which Chicago, Ogden or People's?

A. On bonds, it was Chicago Gaslight & Coke 5's, which
3318 are bonds assumed by the present People's Company. It was the name of one of the largest of the original Chicago companies and the bonds are still outstanding. Newton, Massachusetts, I suppose, Westchester Lighting. So much for bonds.

On stocks: Cambridge, Mass., Charlestown, Mass., Boston, Montreal, Hartford, Kansas City, St. Louis, Louisville, Lowell, Lynn, Masschusetts Gas Company's preferred stock, Albany, Nashville, Toronto, New Bedford, New Haven, Providence, Syracuse, Troy, the United Gas Improvement Company of Philadelphia, Washington, Brooklyn Union, the Consolidated Gas of New York, Detroit, Milwaukee, People's Gaslight & Coke of Chicago.

Q. Do I understand that the Boston Consolidated Company has any bonds outstanding? You gave Boston as in the list of bonds?

A. That was the only city in the list that I could not read distinctly and it looked—it was written as I dictated it to one who wrote in longhand several days ago, and it looked like "Bo." Now it may be intended for Baltimore. I recognize that Boston has not any bonds and it is probably the Consolidated Gas of Baltimore. That was 5's of the issue of 1939, that is, payable in 1939; and I think that must be Baltimore.

Q. Do you think that a five per cent. bond, where the earnings equal only five per cent. on the bonds, would sell at par?

A. Where the interest was paid at five per cent. right along.

Q. Do you think that the bond of a gas company where the earnings of the gas company are barely sufficient to pay the five per cent. and did not show a substantial earning capacity above five per cent., would sell at par?

A. It might have to be joined to dividends of six on stock.

Q. Isn't it as a matter of fact a very important element in the selling price of bonds, the determination of what the earn-
3319 ings of the company are, and how much those earnings exceed the requirement of interest?

A. That always is an element, but in this wide group of securities all of them are practically on a four to six per cent. basis. There are many whose full earnings are probably not known by the investor. He only knows that they have kept up their interest payments and their dividends.

Q. Have you been a large investor in gas bonds?

A. No.

Q. Then your idea as to what the investor thinks is simply your theory, is it?

A. Yes; but I am sure of the fact that the profits of many of these companies are a secret, which is not generally known to buyers of securities.

Q. Well, I don't doubt you do know that, Professor, but some of them pay interest on stock—it is a matter of public knowledge—do they not, or do not most of them pay interest on stock?

A. You mean dividends on stock?

Q. Dividends I mean?

A. Yes.

Q. And that itself would be some indication that the earnings would be considerably more than enough to pay five per cent. on bonds?

A. Yes, I said that myself a few minutes ago.

Q. Have you taken pains in each one of these cases to ascertain the amount of the earnings of the company as distinguished from the amount that they pay on bonds or stock?

A. No, I took the quotations, as I stated in my testimony, of the *Commercial and Financial Chronicle,* and the rate paid by the bonds, as also given there.

Q. Without analyzing each one of those companies I am going to take one company (Table 14) respecting which we all know something, because it is a large company and we can test it; that is the Laclede Gas Light Company of St. Louis?

A. What page is that, please?

3320 Q. 3018. In illustration of your theory you say that the stock of the Laclede Gas Light Company is selling at 95 and paying 5 per cent. and that the preferred stock is selling at 95 and paying 5 per cent.?

A. And it is not in the table but I can tell you the bonds if you wish.

Q. Very good. I wish you would tell me the bonds.

A. What I have here is that all five per cent. bonds are quoted at 106⅞ to 110.

Q. Now you are coming to just the point I want. Will you tell me how many first mortgage bonds there are of the Laclede Gas Light Company in par value?

A. No, sir, I don't know.

Q. Haven't you the *Financial Chronicle?*

A. Yes.

Q. Will you tell me the amount of the bonds, first mortgage, and then the amount of the extending and refunding bonds?

A. If you have the page it will help me quickly.

Q. I haven't it. I have, however, the amount of the bonds, if you wish to verify it: Ten million first mortgage bonds and seven million extending and refunding bonds, or a total bonded indebtedness of seventeen million.

A. I have now on page 166 of the Railway and Industrial Section of the *Commercial and Financial Chronicle,* published on July 28, 1906, a statement about the Laclede Gas Light Company, and you ask me now about the number of bonds, do you?

Q. Yes.

A. It states here that twenty million of bonds, authorized issue——

Q. Of which?

A. Of which six million five hundred thousand dollars have been issued, ten million dollars are reserved to refund the outstanding bonds due 1919, and three million five hundred thousand dollars for not exceeding eighty-five per cent. of cost of future extensions and improvements. Then the outstanding bonds would be sixteen million five hundred thousand dollars.

3321 Q. That is the latest record you have, is it?

A. Yes.

Q. My impression is they will a little exceed that now, but we will take that figure.

A. There may have been a supplement since, but this was the last one I got the other day.

Q. That is the amount of the preferred stock and the common stock?

A. Preferred 5 per cent., cumulative, two million five hundred thousand; common authorized, seventeen million five hundred thousand; outstanding, eight million five hundred thousand dollars; so there is a total of eleven million dollars of stock. The dividends were five per cent. last year.

Q. Do not answer any more than the question; I haven't got to that yet. How much does that make, all told, for bonds and stock, all of which you say are paying five per cent.?

A. Well, eleven million of stock plus sixteen million five hundred thousand of bonds, make twenty-seven million five hundred thousand dollars.

Q. Precisely. Now, you know, do you not, that the output of the Laclede Gas Company of St. Louis, a city of about the size of Boston, has a little less than 3,500,000,000 feet?

A. I have not tried to look up their output and don't know. I wouldn't know any place to look except Brown's Directory for that.

Q. Well, it is about the same as Boston, isn't it? If you have Brown's Directory supposing you look at it, if you think that is an outhority.

(Witness consults Brown's Directory.)

Q. I think Brown's will give the total output and not the sales, but what does that give as the total output?

A. Approximate annual output, four billions cubic feet. That is the directory dated 1906, but relating, I suppose, to last year.

3322 Q. Now for purposes of computation, will you not take 3,500,000,000 feet which I think exceeds the amount of the sales, but it is not far from four billion, and see how much that capitalization amounts per thousand of sales on that basis?

A. It amounts to $7.86.

Q. Yes, nearly $8.00.

A. Yes.

Q. That is to say, they pay five per cent. on nearly $8.00 in securities for every thousand cubic feet of sales on this assumption?

A. Yes.

Q. That would be equivalent to about eight per cent. if you followed it up on five dollars capitalization per thousand cubic feet of sales, wouldn't it?

A. Yes, five per cent. of $8.00 is the same as eight per cent. of five dollars.

Q. Well, if you take that eight per cent. rate therefore, and assume $5.00 per thousand feet of sales as the capital, you would get exactly the same result as to the amount of dividend and interest requirement?

A. That is true.

Q. Now, if you take the Consolidated Gas Company's sales of

13,308,000,000 at even $5.00 per thousand feet of sales, that would make between $66,000,000 and $67,000,000, would it not?

A. $5.00 per thousand feet, yes.

Q. Did you take occasion in looking up the market price of these bonds in these various companies to ascertain what relation they bore to the value of the tangible assets of the companies in each case?

A. No.

Q. That is a very important circumstance, isn't it, in determining the safety to an investor of securities which he purchases?

A. Yes, most of these stocks undoubtedly are much larger than the tangible assets, yet they are on a five per cent. basis, which is a greater confirmation of my theory.

3323 Q. But they are on a five per cent. basis on a very large capitalization in the case of the Laclede Company?

A. Yes; on a legitimate capitalization probably of four and one-half per cent.

Q. And at four and one-half per cent. capitalization on the basis of the Laclede Gas Company, that would be equivalent to a nine per cent. or ten per cent. dividend, wouldn't it, as compared to what they actually do pay on that capitalization?

A. No. I mean capitalization on earnings, not on the stock.

Q. Well, I am taking your own companies and analyzing those.

A. That's right.

Q. Now, taking Exhibit 82 of the present record?

A. I haven't it with me.

Q. I will show it to you. Here it is. Now, in reference to the relation of Stock Exchange sales to dividends, it appears that the highest prices quoted for the Consolidated Gas stock were 241½ in 1887 and exactly the same, 241½, in 1897, is it not, by that table?

A. Yes. That does not mean for the whole year.

Q. No, the very highest quotation ever reached?

A. Yes.

Q. Now, what was the rate of dividend in 1887 when the quotation was 241½?

A. Four per cent.

Q. What was the dividend in 1897 when the quotation was the same?

A. Eight per cent.

Q Just double?

A. Yes.

Q. So there is no special relation between the dividends paid and the market price, so far as that is concerned, is there, in these cases?

A. There is always a tendency to that, but there may be counteracting circumstances.

By Mr. Burr:

Q. Special circumstances?

A. Special circumstances.

3324 By Mr. Mathewson:

Q. Well, so far as that is concerned, the quotation is precisely the same when the stock was eight per cent. as when it was four per cent., in those two highest years; is that right?

A. Yes, sir.

Q. Now, in 1891 the stock sold as low as 92½, didn't it?

A. Yes.

Q. And the highest price was 104¾?

A. Yes.

Q. What was the dividend in 1891?

A. Five per cent.

Q. So that in 1891 the stock paid five per cent. and sold for less than par, and in 1887 the stock sold for 241½ although it paid one per cent. less, or four per cent., is that right?

A. Yes.

Q. So that so far as those particular instances are concerned there does not seem to be any fixed relation between the dividend and the market price of the stock at those times, does there?

A. That's right.

Q. Now, will you look at table 18, the table of Cambridge, Fall River and so on?

A. It is on page 3055. It does not seem to be numbered but that is undoubtedly it.

The MASTER: It is numbered on the preceding page.

Q. Now, when you give the dividend paid upon capital, including bonds, per thousand feet in this table, you refer, do you not, to the dividend on the par value of the securities?

A. Yes.

Q. And not the dividend that is paid upon the structural value of the assets, although they may be greater?

A. Certainly. It is the dividend paid upon the stock.

3325 Q. Now, taking $2.52 for Cambridge as capital, you know, do you not, that some of the Cambridge stock was sold for two hundred dollars a share?

A. I testified, I think, to that effect.

Q. So that would be an addition to the assets of the company which would not appear in this $2.52, so far as the premium on stock is concerned?

A. So far as it applies to new stock issued, that would be true.

Q. My point is that the $2.52 would not adequately represent the structural assets if the stock were sold at a premium, but only carried into this $2.52 at par?

A. That is, any new stock sold at par, allowed by the Commission?

By Mr. BURR:

Q. What would not be true?

A. It would not be true, to apply the premium to all the existing stock.

By Mr. MATHEWSON:

Q. If you averaged it over the existing stock it would amount to the same thing?

A. Oh, no. The law did not go into effect until about 1894, I think, in Massachusetts.

Q. I understand, but when you take the stock oustanding and the market value of stock, you get an average value of all the stock outstanding, of course.

A. Yes, but the inference could not be drawn from that that the premium on all the stock represented investment in structural assets. You could only derive that from stock issued under the auspices of the Gas Commission.

Q. Oh, yes, I understand that. Now, when you stated the amount of dividends that are paid in this table 18, and the amount of dividends per thousand feet of capital, you do not refer to the amount of earnings, net earnings, do you?

A. No.

3326 Q. The net earnings of a company might be very substantially more than the amount distributed in dividends, might they not?

A. Yes.

Q. And do you not know that some stocks sell at par even before they pay any dividends at all?

A. Yes.

Q. On the strength of earnings. So that if there is any test of that character, the real test is the amount of earnings that a company is permitted to make rather than the amount which it sees fit to pay out in dividends to its stockholders, isn't it?

A. Not altogether in Massachusetts.

Q. Well, isn't ordinarily the value of the stock based on the amount of earnings which it makes, whether it pays out any dividends or not?

A. So far as that is known to the investor.

Q. Well, we are assuming that the investor knows a thing or two and that he does not buy blindly. Some companies pay pretty nearly all their earnings in dividends, as you know, and some other companies pay perhaps small dividends and put large amounts to one account or another, but their net earnings are just the same and they all go to determine the real value of the stock, do they not?

A. Yes.

Q. Now did you take pains to ascertain what the net earnings actually were in these cases rather than merely what part of the net earnings was paid out in dividends?

A. You mean in these Massachusetts companies or generally?

Q. Well, generally.

A. Generally there was no data available.

Q. Did you as to the Massachusetts companies?

A. Yes, that is, I looked into their reports to the Gas Commission.

3327 Q. On page- 3021 and 3022 of the testimony you gave a list of various Massachusetts companies, Lynn, Cambridge, Clinton, and so forth.

A. I don't see any table there.

Q. No, I don't think it was in the form of a table.

A. Well, I think you are correct, pages 3022 and 3023, yes. I was looking for a table.

Q. Lynn, Cambridge, Clinton, and so forth?

A. Yes. I have it before me.

Mr. BURR: Clinton, Cambridge, Lynn, Brockton, Newburyport, Fitchburg, Natick, Malden and Melrose, Worcester County.

Mr. MATHEWSON: Yes, eight companies, were there?

The WITNESS: Clinton, Cambridge, Lynn, Brockton, Newburyport, Fitchburg, Natick, Malden and Melrose, Worcester County. Nine now, I count.

Q. Do you include Worcester County in your computations?

A. I understood you to ask me how many companies I had presented here?

Q. Yes, precisely.

A. I say I count nine.

Q. I ask you now if you included Worcester County in your computation or in your statement in that connection?

A. I made no average. I included in this list, if I recall right, every issue of stock to a gas company in Massachusetts last year.

Q. But the Worcester County Company had no earnings, did it?

A. That's right. Well, it paid no dividends. I don't know about its earnings.

Q. Well, omitting that, and taking the other eight companies, did you take pains to ascertain what the assets of those eight companies were and what their profits amounted to on the assets as permitted by the Commission?

A. No. I did not look into that except as I have in the past looked into some of the larger ones, but in preparing this table I did not especially do that.

3328 Q. If my computation is correct it would show assets of those companies of about $5,895,499.60, and profits permitted by the Commission amounting to $595,968.12, or an average return upon the assets of all the companies of something over ten per cent.

A. What do you mean, "permitted by the Commission?"

Q. I am using the same term you have used right along that the Commission permits so-and-so.

A. The Commission had no authority except on a complaint by a certain number of consumers.

Q. I understand that. We won't split hairs on that. These companies are under the jurisdiction of the Commission, are they not?

A. Only on a complaint.

Q. They are under that jurisdiction if they are brought before the Commission in proper form.

A. Yes.

Q. Now if it be true that the earnings of all these companies, their profits, were more than ten per cent. on their assets, that would tend to rebut your theory that only five per cent. or six per cent. should be allowed, wouldn't it?

A. Not at all.

Q. Now as a matter of fact, have you taken pains to ascertain how many cents per thousand, of profits, the Massachusetts companies earn over the operating cost of gas? I mean profits applicable to dividends and interest.

A. Which companies?

Q. Oh, the Massachusetts companies generally.

A. In addition to what they pay out in dividends?

Q. No, over the operating cost of gas. I refer now to the number of cents per thousand that they have available for dividends and interest, which, as I put it, the Commission permits them to earn above the operating cost of gas.

A. It varies from thirty to thirty-two cents generally.

Q. Doesn't it average more than thirty cents for the entire State of Massachusetts, taking all the companies?

A. I have not averaged it.

3329 Q. You would be surprised if it did not equal thirty cents, wouldn't you?

A. I couldn't say I would be.

Q. Of course the maximum rate of dividend or return which is fixed must be applied to a successful company, well located, and not to the average company, must it not?

A. Why, if I understand what you mean possibly the most successful companies earn the largest rate.

Q. In other words, the fact that a company, poorly located, may earn only three per cent., or that the average of all the companies in a State may earn only five per cent., would be no reason why you should limit the dividends of an exceptionally successful company to the average rate, would it?

A. I have not argued on that basis.

Q. I understand. I am asking a question, I am not arguing.

A. There is naturally some premium for exceptional skill. I would not take that away. In other words, I should not insist that a company must be allowed to earn good dividends if it was poorly managed or a poor plant.

Q. You referred to Dr. Humphreys' testimony at Holyoke, and to his reference to five per cent. upon the assets. Was not the testimony in that case directed rather to fixing the value of the entire plant and property of the company, including its intangible assets, with a view to their purchase by the municipality?

A. It was a valuation with a view to purchase by the municipality.

Q. It was not primarily a hearing to determine what rate of charge should be allowed for a company which was to continue, was it?

A. No.

Q. And don't you remember that Mr. Humphreys' associate, Mr. Randolph, made an appraisal of the property, and gave the structural value of the property, excluding franchises and good-will?

3330 A. I recall that Mr. Randolph did some work of that character and that there were structural values presented. I do not at this moment recall the particular work of Mr. Randolph as to distinct matters.

Q. Don't you remember that the earnings with which Dr. Humphreys was dealing represented about ten per cent. on the value of the assets as appraised, excluding the intangible assets?

A. No, I have no recollection as to that physical value.

Q. But you did understand, did you not, that the five per cent. to which Dr. Humphreys referred was five per cent. upon the total valuation of all the property, tangible and intangible, and was not confined to the tangible assets at all?

A. I understood the valuation was based on a capitalization at five per cent. of the net earnings.

Q. A capitalization of five per cent. upon the net earnings?

A. That five per cent. was a fair capitalization and a fair earning on an investment in the gas business.

Q. Did he mean by an investment in the gas business the tangible, structural assets alone or the franchise and good will and value of the established business plus the tangible assets?

A. I don't know what he meant——

Mr. Burr: Well, his testimony is here and speaks for itself.

Mr. Mathewson: You have not got in all the testimony or anything like it.

Q. On the record appears this answer, quoted from Dr. Humphreys' testimony at page 3025 of the present testimony:

"I did not go into that very specifically but I am reinforcing my opinion, &c."

3331 Now, the question respecting which the witness made that answer is omitted from the record or from the quotation as given by Professor Bemis here and is as follows, is it not, Professor:

"Did you in making this value assume that there were any differences in respect to the legal status of gas and electric light companies in Massachusetts and the status of companies in New York and New Jersey, and the other places where you made valuations."

Then there was some discussion between counsel and then followed the answer which has been quoted. Is that correct?

The Witness: Yes.

Mr. Burr: Page 3025 is the page where Professor Bemis quoted the testimony as given by Dr. Humphreys in the examination in regard to the Holyoke Company.

Q. In other words, to be brief, the purpose in that inquiry was to find the total value of the assets of the company, tangible and intangible, was it not, Professor?

A. It was to find what the property was worth for purposes of sale to the city.

Q. Referring to the amount paid by the Massachusetts companies upon paper capital, so far as that is of any value at all, it is true, is it not, that many of the Massachusetts companies are paying ten or more per cent.?

A. I have in my hand the last report of the Massachusetts State Gas Commission——

Q. I do not ask you to name them over but simply to reply to the question generally if you can.

A. On page 103-104 where the dividends are given, I find but three companies, namely the Adams, Attleboro and Marlborough, all very small, that paid over 10 per cent.

3332 Q. You find quite a number that did pay 10 per cent., don't you?

A. Yes.

Q. And that is refer-ing to dividends, you understand, in my question, and not to earnings.

A. Certainly. In my table I gave all the large companies, I think.

Q. So that assuming that the companies earned anything more than they paid out in dividends, the earnings on many of these companies must be over 10 per cent.?

A. On that supposition, yes.

Q. And is it not true, too, that some of the English companies under their method of supervision pay ten per cent. on their paper capital?

A. I am not prepared just now to say what they are. I have not yet gone into that particularly.

Q. Does it not appear by the reports of the Committee of 1886, that the South Metropolitan Company of London was then paying twelve per cent?

A. I don't recall what it stated.

Q. Page 655.

A. Mr. Mathewson, I shall not dispute the accuracy of your quotation if you state as a matter of fact that it is in there.

Q. I will merely ask you to correct me, if I am wrong if you are willing to leave it that way?

A. It is a mere matter of a quotation appearing in a report twenty years ago, and if you are reading from it I have not any reason to doubt that you are reading it correctly.

Mr. Burr: Did it not further state that they were selling gas at 75 cents?

Q. In many of these cases in which you testified that stocks and bonds were selling on a five-per cent. basis, it appeared, did it not, that the price of gas was well over a dollar?

A. I never looked into that carefully, but I do not believe, and I
know most of these companies off-hand, I do not believe that
3333 the price exceeded one dollar in more than one-tenth of the
companies selling over one hundred million feet, but it certainly only exceeded a dollar in a very few cases and it was less than a dollar in some of them.

Q. That answers my question.

A. Lowell and Lynn is 90 cents and Boston is 85 cents, and I quoted Chicago. That is 85 cents, too.

Q. You testified in Boston, in December, 1904, or about that time and advocated there a six-per-cent. rate, didn't you?

A. I don't remember what I suggested, but six per cent. has been the usual rate that I have suggested for quite a while.

Q. Can you remember whether you advocated a six-per-cent. rate in Boston or not?

A. Absolutely I don't remember, but if you find it there I do not doubt it.

Q. I do find it there, and you say you represented the city on that occasion as well as another interest.

A. Yes.

Q. Are you not aware that when Mr. Morse referred to the six-per-cent. rate and proposed to go into a discussion of that and the propriety of a six-per-cent. rate, Mr. Babson, the attorney for the city for which you were acting, said that he would not argue that at all.

A. I don't remember about that.

Mr. **Burr**: Does he say why?

Mr. **Mathewson**: Obviously, because he does not consider that it was fair.

Mr. **Burr**: No, that is not obvious at all.

Q. Will you look and see whether Mr. Babson, the attorney for the City, said that he would not argue that at all?

A. On page 602 of the record in this case I find a question from Mr. Mathewson to that effect.

3334 Mr. **Burr**: And Mr. Morse added, "I don't know that you will, but I think somebody is going to argue it in this case."

Mr. **Mathewson**: Mr. Babson was the attorney for the City for whom Mr. Bemis was testifying there.

Q. Is it not a fact that the Committee of the Legislature of Massachusetts as late as 1900 referred to the ten per cent. maximum up to which a company might be permitted to earn if it could, as recognized by custom in Massachusetts?

A. I don't recollect.

Q. You do remember, don't you, that in the investigation in 1900, by the Legislature the question arose of bringing the New England Gas & Coke Company, to which I have referred (I think I have referred to it heretofore as the New England Coal & Coke Company), under the wing of the Commission, although that company manufactured gas but distributed none; and the Committee of the Legislature in Massachusetts, House Document No. 1405 of that year, referred to the propriety of that action; and will you look at this document which I show you and say if the committee in that connection did not say in substance that in that event they would be compelled to allow the New England Gas & Coke Company to pay "not exceeding, of course, the ten per cent. heretofore recognized by customs," at the bottom of that page?

A. This report of the Committee on Manufactures, dated June 11, 1900, stated as you read, as follows: "The enactment of any law which will place the New England Coke Association under the control of the Board of Gas & Electric Light Commissioners as the New England Gas & Coke Association at present exists, without first compelling it to incorporate, will be a legislative sanction and 3335 approval of its $35,000,000 securities and it would compel the Board of Gas & Electric Light Commissioners for all time in arriving at the cost of gas to reckon and allow all charges, interest or dividends that the New England Gas & Coke Association chose to pay upon the $35,000,000 of securities, not exceeding of course the ten per cent. heretofore recognized by custom." That is the quotation but it is an incorrect statement of the practice of the Commission.

Q. That is the report, is it not, of the Committee of the House of Representatives of the Comonwealth of Massachusetts, which was investigating this very subject in 1900?

A. Yes, but it is a wrong statement of the facts.

Mr. Burr: And you dispute its conclusion as the conclusions of the Stevens Committee are disputed here by the Consolidated Gas Company?

The Witness: Yes. No ten per cent. position has been taken by the Massachusetts Gas Commission.

Q. Don't you know that the Massachusetts Gas Commission permits a well regulated, successful and well located company to earn as high as ten per cent. if it is able to do that?

A. It will and has reduced it below that when cases have been brought before it. It has no right to initiate proceedings.

Q. In any case where it does not believe ten per cent. can be earned, total net earnings upon the structural value of the property?

A. They have reduced prices so as not to leave ten per cent.

Q. Will you name the cases that you think they did?

A. I have not them in mind at the present moment.

Q. Now, a lot of English companies pay ten per cent. dividends, don't they?

3336 A. That applies to some companies for their original stock issued many years ago.

Q. But a lot of them have that ten per cent., have they not?

A. I don't remember how many. There are some.

Q. Well, say a lot, put it generally; that is about right, isn't it?

Mr. Burr: What do you mean by "lot?"

Mr. Mathewson: Let the professor put his own construction on it.

A. I don't know. I know there are a number. There are a good many but just how many I don't know.

Q. I will simply read from the Syracuse testimony on that subject—*A.* A good many of the older companies.

"Q. In England how much are companies allowed to earn on the capital paid in 1887? A. I don't know.

"Q. Did not your investigation extend to them over there? A. A lot of those companies had ten per cent., but I don't know that there is a law for all of them."

A. Yes.

Mr. Burr: Which page?

Mr. Mathewson: Page 2942 of the Syracuse testimony.

The Witness: It is simply a vague expression. I meant to say that a good many of them do.

Q. And seven per cent. after that time?

A. But there is an option clause in all of those.

Q. And seven per cent. afterwards in all of those?

A. Seven per cent. with the option clause. The actual earnings on the actual stock is much below what those figures would indicate.

3337 Q. But not below the actual earnings on the assets, is that right?

A. What?

Q. But not below the actual earnings on the assets, is that right?

A. I don't know what you mean by actual earnings on the assets.

Q. I mean the actual earnings as applied to the assets, the value of the assets, to get your per cent.

A. I cannot say as to that.

Q. I will just read a little more from the Syracuse testimony:

> "Q. Wasn't ten per cent. prior to 1887? A. Not for all companies.
>
> Q. And seven per cent. after that time? A. I think that relates to a certain class of companies.
>
> "Q. Will you testify positively that that was not the fact as to all the companies there and the sums allowed during those periods? A. It may be. I am not sure. There are many companies that have that——"

That is all on that subject so far as I can see. Do I quote that correctly, Professor? (handing book.)

A. I believe you do.

Q. Are you also familiar with the fact that the Senate Committee of 1886, Senate Document 47, recommended ten per cent. as a maximum rate for the earnings of this Company, with a further allowance of a reserve fund to accumulate until it equalled ten per cent. of the capital?

A. I don't remember it now. Ten per cent. twenty years ago is quite different from that now.

Q. Perhaps not, if you put most of your money in twenty years ago on that basis. What did you allow the Syracuse Company in your recent testimony up there as a return upon capital?

A. I think I gave them on different bases showing——

3338 Q. What did you allow them finally?

A. I don't remember.

Q. Can't you remember? That was inside of a year?

A. Yes, but I have had so many figures to deal with and other matters that I am not carrying them in my head. When I get through with a case I try to dismiss it from my memory and think of something else. My impression now is that bearing in mind the decision of the New York State Gas Commission for eight per cent. in New York City, I made an estimate on an eight-per-cent. basis in Syracuse, in harmony with the eight-per-cent. basis used in the decision by the Gas Commission for the City of New York.

Q. Well, did you allow 8 per cent., put it in that way?

A. No, I never intended to, and I remember having conferences with the attorneys in which I said 6 per cent. was sufficient, but I think I made an estimate on the witness stand of what 8 per cent. would amount to.

Q. I read this from page 2936 of the Syracuse minutes, testimony of Prof. Bemis, referring to another subject in the first part of this question:

> "Q. And therefore struck out as compared with 100 years. Well we will pass that. You allowed us 8 per cent. dividends, did you not? A. Yes."

A. That means, allowed in the computation I made. I made a computation as you will find on some previous pages.

Q. You did make a computation there in which you allowed 8 per cent.?

A. Yes.

Mr. **Burr**: Just as you have here.

The **Witness**: Certainly, I have done so in this case.

3339 Q. And that is what you meant when you said you allowed 8 per cent?

A. Yes, you will find I have done that in one of the tables here.

Q. And the Gas Commission to which you have referred as allowing 8 per cent. allowed that after they heard your testimony in which you recommended a six-per-cent. basis, didn't they?

A. Here in the city, yes. I used 6 per cent. in Chicago and Montreal, I remember.

Q. Did you not find in the testimony of the Stevens Committee with respect to which you have spoken, the basis assumed by Mr. Hughes in his question as to return was an eight per cent. basis?

A. I don't remember.

Q. Did you not observe that he asked the witnesses what the earnings would be on the various capitalizations at eight per cent.?

A. I don't remember.

Q. Professor, in some cases you have referred to the question of candle-power marked disapproval of a candle-power as high as 22, have you not?

A. Yes.

Q. And you have advocated an 18 candle-power?

A. Yes.

Q. You are still of the same view, that an 18 candle-power, all things considered, is better for all concerned, are you not?

A. Yes.

Q. And if the public wants a 22 candle-power or some higher candle-power, it is for the public to pay for the additional cost?

A. Of course, it must do that.

Q. Let us refer now to the cost of the properties of the Consolidated Gas Company on the basis which you have advanced. You say at the outset that you took certain figures of Mr. Yalden, the accountant for the Committee of 1886. Mr. Yalden was an accountant only and not a practical gas man, was he not?

3340 A. The evidence so far as I am aware, brought him in as an accountant.

Q. Are you aware that he had anything before him except the books of the constituent companies from which he made his report?

A. I think he went back to vouchers and pay rolls.

Q. Well, have you any evidence that he did so except the testimony before the Commission of 1886?

A. I have nothing except what is in that testimony.

Q. You found that these companies which consolidated in 1886 forming the present complainant, had many of them been paying large dividends, didn't you?

A. Yes.

Q. Very prosperous companies, apparently?

A. Yes.

Q. And you found the statement of the Committee of 1886 was that, except so far as the franchises were concerned, the property in 1884 appeared to have been appraised at simply its cost of reproduction?

A. They said that Mr. Yalden's figures were in contradiction of that. They also said——

Q. Did they say anything more than this, that the only evidence against the value as fixed by the appraisal of 1884 being fair was the fact as reported by Mr. Yalden, that the properties or some of them were appraised at a higher figure than they appeared to be charged on the books of the constituent companies?

A. Yes.

Q. That was substantially what the Committee said?

A. Yes, and in that they did not correctly quote the evidence.

Q. You think that the Committee of 1886, who had all these witnesses before them and went into the subject for an entire year, did not know what they were talking about?

A. Right in black and white there is proof to the contrary.

3341 Q. You draw deductions from the evidence contrary to the Committee of 1886, do you?

A. There is evidence——

Q. Well, do you?

A. Yes.

Mr. Burr: You are speaking of the majority report?

Mr. Mathewson: Yes.

The Witness: Yes. The chairman reported differently.

Q. Did you find in the report of the majority of the Committee so far as the franchises were concerned, which were appraised at $7,781,000, the statement that the franchises of four of the companies alone were worth more than the entire $7,781,000?

A. I don't remember about that.

Q. Did you observe that the assets of the Knickerbocker Company, which was under lease to the Municipal Company at that time, were not carried into this $20,942,000 total which Mr. Yalden reported, except only to the extent that the Municipal Company had made expenditures on the Knickerbocker plant?

A. My impression was that all the assets were carried in, that is the way I understood Mr. Yalden's report.

Q. Don't you know that the Knickerbocker Company had outstanding something like $1,200,000 of bonds when it was leased by the Municipal Company and that no assets were carried into this total at all representing this $1,200,000 of bonds?

A. I did not gather that any assets were omitted by Mr. Yalden.

Q. You understand, do you not, that the Act of 1884, under which the Consolidated Company came into being, provided that the constituent companies might consolidate at the aggregate value of their property, franchises and rights at that time, and not upon the basis of original cost?

A. While I have read the report, at the moment I don't
3342 remember its exact wording.

Mr. **Burr**: But the Act Mr. Mathewson is referring to is in evidence and speaks for itself.

The **Witness**: I don't remember the exact language.

Q. Don't you remember the statement of the Committee of 1886, in their majority report, that there was no great complaint as to the valuation of the tangible property which was valued at $29,994,000 at that time, but that the main complaint was that the company had capitalized its franchises at $7,781,000?

A. They made a remark along that line, but with the reservation that Yalden's figures were different, and they did not correctly quote, as I said, the testimony.

Q. Their reservation was, was it not, that Yalden's figures, as derived from the books, showed, or tended to show, that the costs of the properties originally were less, is not that a fair statement?

Mr. **Burr**: The report is the best evidence.

The **Witness**: The report had better be quoted here.

Mr. **Mathewson**: Yes, but the Professor has been referring to the report from time to time in his testimony and I am very briefly testing his understanding of it. That is my last question on that subject.

The **Witness**: My recollection is that Mr. Yalden was the one they quoted as having given different figures for the cost of the plant.

Q. You don't find in your examination of the testimony, do you, that any witness was called who purchased or acquired for
3343 any one of the constituent companies, any item of their assets and testified as to what the cost was?

A. There was no purchase that took place.

Q. By the constituent companies was there not?

A. There was simply a consolidation.

Q. Do you mean to say that the six constituent companies never purchased any property?

A. I thought you meant that the Consolidated Company—purchased from the constituent companies.

Q. There again you misapprehend me. Did you find any evidence presented, any witness appearing aside from the books to testify what the cost of the assets of the constituent companies was or anyone of the assets?

Mr. **Burr**: Do you mean their original cost?

Mr. **Mathewson**: Yes.

A. No witness except Mr. Yalden.

Q. But he proceeded on the books and records?

A. Yes, and he was backed up by the president of the Mutual.

Q. And besides that, no witness appeared to testify what the original cost of these items was.

Mr. **Burr**: Except Mr. Kennedy.

A. Mr. Kennedy testified as to his faith in Yalden's report.

Q. Oh, yes, but can't you answer my question?

A. There was no other witness, neither was there anybody that disputed it.

Q. Did not the Committee in substance say that the value in 1884 was the basis upon which the companies were entitled to capitalize, and did not the majority of the committee therefore fail to go into the question of cost at all? Now give me a fair answer.

A. The majority took that position, two members taking 3344 one position and the Chairman taking the other.

Q. We lay greater stress on majority reports than we do on minority reports.

Mr. Burr: The minority report took the contrary view and gave its reasons *in extenso,* which are in evidence in this case.

Q. Now let us look at Table 15 for a moment, entitled Cost of the Gas Properties up to October 31, 1905:

A. Page 3046?

Q. Yes. Now in starting this off you say, cost in 1884, $20,942,632.85?

A. Yes.

Q. That is the amount, is it not, which Mr. Yalden reports as the property being charged as costing on the books of the six constituent companies, or the figure at which it appears as carried on the books of the companies, if you please?

A. Yes.

Q. To that you add net increase from 1884 to October 31, 1905, $9,693,565.90?

A. Yes

Q. From what time in 1884 did that increase accrue?

A. I think it was November 11.

Q. Don't you know that between the appraisal of June, 1884, and November 11, 1884, there was an addition of nearly two hundred thousand dollars to the assets of the Consolidated Gas Company, which you have omitted entirely?

A. Perhaps there was that amount. I remember there was some such amount.

Q. Suppose you look at Exhibit 71 of the present record and see what the amount was that you have omitted here?

A. $196,419.01.

Q. Well, then, so far as this is concerned upon your own theory, there should be added $196,419.01, should there not?

A. Mr. Yalden's report was of June instead of November. I have forgotten which it was. If you say Mr. Yalden's estimate 3345 was of the earlier period then that should be added. May I ask if it was?

Mr. Kirby: That is right. It takes two figures. The first one was the one stated here and the next was the addition of that amount.

Q. My understanding of his report was that $20,942,682.45 covers the same property appraised by Mr. Rowland at $29,994,000, and that was of June, 1884.

A. With that understanding this $196,000 should be added.

Q. Now that would make a total of about $31,450,000 in round figures, would it not?

A. I get it $31,449,087.84 or roughly, $31,450,000.

Q. Now you have deducted from this total the item: "Less value of the property taken by the city at 18th Street and other property sold by the Company given in the testimony of Prof. Marks, page 2364, $1,985,874.37." The figures that Prof. Marks took were the present value of the land and other items which he deducted, were they not?

A. I think it was.

Q. Don't you know, if you have read his testimony, the figures he took were the present value of the land which we now value at $15,000,000, but which you valued according to the report of 1885 at only about five million dollars?

A. I think this was based on the sale to the city, which of course, is present value.

Q. Let me ask you if this is a fair way to make the comparison, to take the value according to Yalden in 1884 which included land, as you have stated at about $5,000,000, and deduct therefrom property which has now been disposed of, at the present land value, which is three times that according to our testimony?

A. Certainly, I think it is fair.

3346 Q. You do?

A. Yes.

Q. In other words, while the same land went into the $20,942,000 at, we will assume, $600,000—you could pick it out—you think it is fair now in making this deduction to take out one and one-half times that, do you?

A. Provided it is sold for that. I am not taking out a theoretical valuation, I am assuming the company is to get this money for it.

Q. And you think it is fair to take out the present value of the land from the original appraised value, do you?

A. I think if the company paid $5,000,000 for land and subsequently did not require the use of a million dollars of that land, and could sell it for $4,000,000, that $4,000,000 cannot be capitalized, but should go into the business as providing for extensions.

Q. Does it not go into the pockets of the stockholders, if it is the surplus upon the capital?

A. It is part of the earnings that tend to make up the legitimate six per cent. I have said this morning that the unearned increment does not belong to the stockholders.

Q. It does not?

A. It is part of the earnings of the company, but I should not give it in excess of the six per cent.

Q. Supposing a company has assets of one million dollars, a part of which is land; supposing that land increases so that its assets are worth one and one-half million dollars and the company winds up; does not the entire one and one-half million dollars go to the stockholders?

A. Yes.

Q. Supposing the company was able to dispose of part of its land and obtain two hundred and fifty thousand dollars for it, and still had its entire capital of one million dollars intact, would not that surplus go to the stockholders and be divided among them, and if not, why not?

A. My understanding of it is that would not be allowed in Great Britain.

3347 Q. Well, we are talking about New York City, and good fair business judgment.

Mr. BURR: I think you are under a misapprehension, we are not deducting the present value, we are deducting the present price which you have received. This is money you actually received for the land.

Mr. MATHEWSON: No, we have not received it, and whether we will receive it or not, Heaven only knows, because the city has condemned this property and they have not yet paid us. But that is another proposition.

Q. Assume that we have obtained for that land one million dollars and that we still have land upon which we are still manufacturing gas to supply our consumers, and having taken that million dollars and distributed it to our stockholders, our capital is still intact, are we not entitled to distribute that to our stockholders?

A. I don't think so.

Q. What should be done with it?

A. To be used in new construction as you need it.

Q. So in getting at the present value of property you would take land appraised or carried on the books in 1884 at five million dollars, making part of a total; you would then deduct from that the land which was disposed of now at three times the price, three times the amount at which that particular land was carried in Yalden's figures of 1884, and you think the balance would be a fair balance?

A. Certainly. I don't think you are entitled to more than six per cent., you are not entitled to the unearned increment on the rise of that value of that land.

Q. Did you not testify before the Gas Commission in response to my question that if a company had a surplus in the value 3348 of its land, it was entitled to divide that among the stockholders and that it belonged to the stockholders and did not belong to the consumers of gas?

A. I don't remember.

Q. I suggest that you look them up, professor, for unless my recollection is at fault, and it is not often on those things, you will find my statement is right.

A. But if I did say it, I should say I was mistaken. But I don't remember saying it.

Q. Now, I am going to put another question to you. We will suppose here is a company in the gas business that proposes to go out of the gas business in a certain city; it has land which is then worth a million dollars, but which cost it seventy-five years before, five hundred thousand dollars; of course if it goes out of the gas business it can sell its assets, distribute the assets among its stockholders and go out of business, can it not? In other words, it is not obliged to distribute any part of those assets to the consumers of gas, is it?

A. I should think it could go out of the gas business and wind up, I should think so.

Q. And its assets should be so distributed to its stockholders and not to anybody else after the payment of debts?

A. I should think so.

Q. Now, we will assume that another company proposes to take the place of this company in furnishing gas to that community and it buys land equally well located for the purposes of its gas plant, a prudent investment, and has to pay $1,000,000 for its land, because that is the market value. Would not the company in having a price fixed which it might charge for gas, be entitled to a computation of a return upon $1,000,000 which it thus prudently expended in land?

A. I think so.

Q. And supposing that this successor company that intended to go into business bought this very land of the company which 3349 was going out of business and paid $1,000,000 for it, it would then be likewise entitled to count its land as $1,000,000 in computing its capital upon which it was entitled to a return, would it not?

A. I doubt it.

Q. In other words, if this new company going into business saw fit to buy its land from some third party and pay $1,000,000 for it, it could include that $1,000,000 as part of its capital upon which it would earn return, but if it bought equally good land from the company that was going out of business at $1,000,000 it could not include the $1,000,000 in its capital for return. Now, that is your statement. Is that what you want us to understand?

A. I will modify it to the extent that I have not perhaps thoroughly settled on this question of what would happen in that particular instance. But I answer positively that if a new company bought the old one out, as a going concern, it would not have the right to capitalize any of the price it paid for the old company but only could continue to earn on the original structural assets. That was tried in Haverhill and the Massachusetts Gas Commission ruled it out.

Q. And that is still at issue and the courts have not decided it yet?

A. Yes.

Q. Then the proposition is this: While the new company might purchase land and pay a million dollars, equally well located, from a third party, then that would be part of the capital upon which the new company would be entitled to earn, yet if it bought land for a million dollars from the old company for the same purpose, the old company going out of business, then it would be doubtful whether it would be entitled to include that million dollars in its capital?

A. I will not take a positive position on that question. When the old company goes out of business absolutely and ceases to 3350 exist, I am not positive, but when the old company is bought out as a going concern, then I am positive as to the land. Of course the most of the Haverhill case related to improvements and not to land.

Q. Take this position. If, then, the new company buys land from a third party for a million dollars and goes into the gas business it is entitled to a return on that one million dollars, and perhaps it is if it buys the land only from the old company at a million dollars, but does not buy out the old company as an operating concern; but the old company, if it continues in business and uses that same land of the same value, would not be permitted to include a million dollars as part of the capital upon which it would earn, is that your proposition?

A. Yes, as long as it is in the business of gas manufacture it cannot recapitalize its land value. If it goes out of business and winds up, then I think it would be entitled to what it sells the land for.

Q. You feel pretty sure about that, don't you, Professor?

A. Yes.

By Mr. Mathewson:

Q. Let me proceed a step further, Professor. The new company if it laid its mains under an existing pavement, which we will assume is new and improved pavement, would have to expend, of course, the cost of reproducing the mains under the present pavement?

A. Yes.

Q. And if they did that they would be entitled to a return on that amount as part of their capital?

A. Yes.

Q. Whereas if instead of doing that, there being no collusion, they purchased from the existing companies the mains of the existing company, at a little less than the cost of reproduction, just a little less, not much, they then would not be entitled to include
3351 the mains which they had so purchased and add the cost to the new company as part of the new company's capital upon which it might earn. Is that right?

A. Before I answer that let me ask you what your further supposition is as to whether the old company continues in business or not.

Q. I will assume that the old company went out of business.

A. I would say that the new company might be justified in recapitalizing the expense that it was put to, to get possession of these mains, provided it did not pay more than they could be duplicated for; but I say that if it bought out the old company as a whole, as a going concern, it could not increase its capitalization because of any money it paid in excess of the original cost of those mains.

Q. It might wait until the old company was out of business and buy in detail perhaps.

A. Gas Companies are too prosperous to go out of business.

Q. Not all of them.

A. They are in large cities.

Q. And the same theory would prevail as to all the other classes of assets of the old company, would it, as acquired by the new company?

A. Well, I have made a disinction between pavement and land one the one hand and other structural assets on the other, so I don't know just what is implied by your new question.

Q. I will put this question. Supposing all the assets of the old

company would cost to reproduce now ten million dollars, and suppose it is going out of business and a new company is organized by other parties to take up that business. The new company has the option of reproducing a plant of ten million dollars, but it meets the officers of the old company and the old company says "we will sell you this plant, all of it together as it exists to-day, for nine and a half million dollars and make a discount." Now your proposition is, as I understand it, that if the new company bought
3352 out the old company in that way for nine and one-half million dollars, it could not include all of that as part of its capital upon which it was entitled to a return, whereas if it put in its new plant for ten million dollars it would be entitled to count that ten million dollars as its capital upon which it was entitled to a return, and if you think that is so, where does the advantage to the consumer come in by compelling him to put in a ten million dollar plant where he could get one for nine and a half million dollars?

A. If the old company is still in business and is bought out for $9,500,000 that cannot be an excuse for increasing the capitalization. But if the old company has actually disappeared from the field as a gas producing enterprise, it would be like what I've said as to the mains or the land.

Q. It would be to the advantage of the public, would it not, that the new company should acquire the entire plant of the old company at $9,500,000 rather than put in a new one in its place for ten million dollars, assuming them to be equally efficient?

A. I can see some reason for that position.

Q. Now referring to Table 15, respecting which we were speaking at page 3046 of the record, the $196,000 is not in the table. Is there any working capital in that table?

A. No, I put that in in the next table, or the second table after it.

Q. Except the materials and supplies of $616,470.08?

A. Yes. You will find, in the next table 16, the million dollars for working capital.

Q. I am referring now to Table 15?

A. No, it is not in there.

Q. Is the property of the National Coke & Coal Company included there?

A. No.

Q. Why not? The income of the National Coke & Coal Company you took as part of the miscellaneous income and took that out the operating cost of gas in order to reduce the cost, and
3353 if you do that, how can you fail to include the National Coke & Coal Company in the capital?

A. Well, it was only $50,000 capital in all.

Q. It is not a question of amount, it is a question of consistency. Now, there is Table 11, in which appears as part of the $177,710.53, miscellaneous income, the following: "Dividends of National Coal & Coke Company, $5,000." That makes part of that total. Now, how can you deduct the income from the National Coke & Coal Company from the cost of gas on the one hand and exclude the investment in the National Coke & Coal Company from the capital of the Consolidated Company on the other?

A. It is possible that I could not. I may be mistaken, but I rather think I should have excluded that $5,000.

Q. Should you have excluded the $5,000 in miscellaneous income, or should you have included the investment in the National Coke & Coal Company in the capital of the Consolidated upon which it may earn a return?

A. I rather think I should have excluded it. It is another company altogether.

Q. But you understand that the testimony is that it is really the cartage department of the Consolidated, and didn't you read in this testimony, if you have read it through, the statement of Mr. Gans, one of the counsel for the State, that they claim that the National Coke & Coal Company is part of the capital of the Consolidated and accordingly its returns should be credited in the cost of gas?

A. Yes, I think I have read such testimony. I am not able to say whether you quote it with absolute accuracy or not.

Q. I am trying to be substantially accurate.

Mr. Burr: Mr. Mathewson quotes it as a statement which he claims was made by counsel for the State.

3354 The Witness: I will say that I do not recollect the testimony, except this, that there was a claim that the National Coke & Coal Company was owned by the Consolidated Company. I do not recall much beyond that, save an exhibit as to their operating expenses and dividends.

Q. And of course this Table 15 does not include either the values of the company's franchises, does it?

A. No.

Q. Nor the value of the good-will or of an established business which forms part of the value of a going concern?

A. It does not include good-will or franchise value.

Q. Nor does it include anything for the Astoria investment, does it?

A. It does not.

Q. You remember the amount expended at Astoria, on June 30 last, was testified to be $7,710,000?

A. I don't remember the exact figures. They are not very different, from my impression.

Q. Nor does that include any part of the $5,500,000 or such matter that Professor Marks allowed for additional capital as producing a portion of the gas which the Consolidated Company is now selling, does it?

A. No. I don't think it necessary since this company was buying its gas and paying for it, to put in addition a return on the capital which the New Amsterdam Company, or the Standard or the Central Union were employing.

Q. You know the contracts that provide that gas shall be delivered to the Consolidated at the bare cost of labor and material plus ten per cent., which ten per cent. ordinarily amounts to three cents, or in that vicinity?

A. Yes. I am aware of those contracts.

Q. And that three cents is not a very heavy return on the capital invested and producing, is it? Three cents per thousand feet?

A. No.

3355 Q. And you hadn't thought whether that arrangement was temporary, awaiting the completion of the Astoria plant only or whether it would be possible to make a permanent arrangement of that kind, had you?

A. I understood the company to say that the majority of the stock of those companies was controlled by the Consolidated.

Q. They are entirely distinct concerns operating with other stockholders, and the trustees and the directors must protect the minority as well as the majority. But didn't it occur to you that it might not be possible to continue indefinitely procuring that gas at the mere cost of labor and material, with only three cents over to represent return on capital investment?

A. You brought that up.

Q. I ask if that did not occur to you, as to whether that could be continued indefinitely?

A. I had observed that there was no testimony on the subject so far as I could recall. I thought it——

Q. Now you said at page 3050 that you exclude two million dollars due from consumers and that that "might be considered as a surplus." I think your statement that that "might be considered as a surplus" may occur on a later page. What did you mean by that expression, it "might be considered as a surplus."

A. Why, it did not seem to be covered by the amount covered by previous exhibits of extensions, new construction, since 1884, and it seemed to have been undivided profits. It was not in the 1884 appraisal and is in this appraisal.

Q. Do you mean to say that the amounts due from consumers are necessarily undivided profits?

A. I mean to say by that growth of assets. It is an asset of the company as a growth, for there was scarcely any of it, if I recall, in 1884; that the growth of that amount due to the company was one of the profits of the last twenty years.

3356 Q. Don't you know that if you have sales of thirteen and one-half million feet per annum and send out bills monthly and collect promptly, you still would have outstanding in accounts receivable something like $1,100,000 all the time?

A. Well, it wasn't anything in 1884?

Q. But don't you know that?

A. Why, I think so, yes. That is, it depends on how you send the bills out.

Q. Does that mean that is surplus of profits merely because you have that amount due to you?

A. It is part of your profits and if you began in 1884 with an arrangement of some kind, under which you were not credited with anything of that kind, and now in the course of twenty years you have two million dollars that you did not have to start with, I would say that that was a profit.

Q. But we haven't it. It is money due.

A. Yes, but there wasn't any money due in 1884.

Q. Don't you understand if the company has a million and a half or two million dollars of money out in account receivable that the probability is it has to secure funds at some other point to carry itself? Isn't that ordinary experience?

A. I think the million dollars adds that working capital.

Q. That is your view?

A. Yes.

Q. You have never managed a gas company, I understand, and especially one of the size of this one?

Mr. BURR: I think you asked that question before.

Mr. MATHEWSON: I think it is quite obvious, perhaps.

Q. Now in case the company does require a larger amount of working capital than a million dollars, adjustments being made, that would be allowed?

3357 A. If it required it, although I am not sure how it would be financed. If it requires that—I will say yes. I will leave the question answered for the time being as I did a minute ago. I may return to it, but I will leave it now.

Q. Did you not read the testimony of Professor Marks which showed that these typical Massachusetts companies which he selected, even excluding notes payable, had a working capital of thirteen cents, which would amount to $1,726,000, as he computed it?

A. I remember reading over his testimony very hastily, about 13 cents, but I don't remember dwelling on it at all.

Q. Don't you remember that your attention was called to the fact that the notes payable were treated as capital by the Massachusetts Gas Commission, and that making that correction in his testimony these Massachusetts companies which he considered typical, showed 47.8 cents per thousand feet, or something more than $6,000,000?

A. I remember there was a long discussion on it but I had so much else to attend to and since I was not going to refer to the Massachusetts companies in that respect, I left that for him to treat.

Q. I understood you had read his testimony with great care and you collected certain figures from Professor Marks' testimony?

A. Some portions of it I read with far greater care than others. I have been limited in time and strength.

Q. Well, if the figures to which I have drawn your attention are sustained by the operations of these Massachusetts companies that would tend to negative your theory that only $1,000,000 is required, or something like seven cents, for working capital per thousand feet, wouldn't it?

A. If the evidence tends to establish it would be two or three million, of course, I would accept it.

3358 Q. In other words, what is required we are entitled to add?

A. Certainly.

Q. You in your testimony here, in your computations, under the heading, "Capital, including bonds, per thousand sold" did include the notes payable in Massachusetts?

A. Referring to the testimony in Boston?

Q. No, to your schedules that are here presented, such as table

No. 18, "Cambridge, ten per cent., $2.52," the $2.52 being under the caption "Capital, including bonds, per thousand sold?"

A. Including bonds, yes.

Q. You understand, do you not, that the notes payable are included in that $2.52?

A. Well, I took it just the way the heading was in the Gas Commission's report.

Q. Haven't you made a careful enough study of that report so that you know whether notes payable are included under the heading, "Capital including bonds per thousand feet sold?"

A. I took that table direct from the Commission without stopping to go back to the Appendix to see how they made it up. I didn't verify that table.

Q. So you don't know whether it includes notes payable or not?

A. No, I suppose it included all that the Commission considered was rightful capitalization, but just what the Commission considered in making up that table, I didn't have time to investigate.

Mr. Burr: There is a note to that table, as follows: "(1) There are no bonds, but the above item includes 22 cents per thousand feet sold of notes payable unsecured."

Mr. Mathewson: Yes.

3359 Q. Now, I will direct your attention to table No. 16, appearing at page 3052 of yuor present testimony, and table 17 immediately following it. As to the first basis of capitalization used, $29,266,757.48, that is identical, if I am correct, with the capitalization of table 15, which we have just discussed, is it not?

A. Yes.

Q. And that excludes the $196,000 of increase between June and November, 1884, the entire Astoria investment, all working capital except $616,000 of material, the stock of the National Coke & Coal Company, the franchises and the good will?

A. Table 16 has the million dollars for working capital additional included, which you did not mention.

Q. Yes. With that exception, all the items to which I have just referred are omitted in this $29,266,757.48?

A. Yes.

Q. And in the $40,500,454.99 there is excluded the Astoria investment, the entire working capital except the $616,000 of material, and the investment in the National Coke & Coal Company and the franchises and good will?

A. That's right.

Q. And in the $49,281,454.99 there is excluded the Astoria investment, the National Coke & Coal Company investment, all working capital except one million dollars?

A. That is excluded, too.

Q. That is excluded, too. Very good. All working capital. Now——

A. Well, the $616,470.08 is in there.

Q. All the working capital is excluded except the $616,000 of material?

A. Yes.

Q. Now, in order to be quite fair, I am going to take the rate of return which the Gas Commission found was fair and the cost of gas that the Gas Commission found and see where we come out. The Gas Commission reported the cost of gas to be 62.56 cents did they not, if you remember, including the 1.81 cents for the additional two candle power? 3360

A. I think that was the figure. I haven't it clear in mind.

Q. Now, at eight per cent. you figured the profit on the $29,266,757.48, which is your smallest amount, at 17.6 cents; or if you include one million dollars of working capital, which would make $30,266,757.48, you figure it at 18.2 cents per thousand feet, do you not, at eight per cent.?

A. That is 17.6 cents and 18.2 cents; that is right.

Q. Now, if you add that to the Gas Commission's finding of the cost of gas which did not include any allowance for reserve at all, you will find what total?

A. 80.76 cents.

Q. And if you take your second amount of $40,500,454.99, eight per cent. on that would be 24.4 cents, according to your table?

A. Yes.

Q. And that added to the finding of the Gas Commission as the cost of gas, would make how much?

A. Adding that to 62.56 cents, would make 86.96 cents.

Q. And taking the final amount of $49,281,454.99, eight per cent. on that you compute to be 29.7, do you not?

A. Yes.

Q. And adding that to the cost according to the Gas Commission, what is your total?

A. 92.26 cents.

Q. So that with no reserve whatever included in the cost of gas, and with these various capitalizations shown in table 16, excluding the various items which the Consolidated Company claims should be included, and which I have recited in every case, the return on the capital at eight per cent. upon your assumed amounts would exceed the 80 cents which the present act provides, if added to the cost of gas as bound by the State Commission?

3361 A. On those suppositions. It is a mere matter of computation.

Q. Yes, that is true, is it not, on those computations?

A. Yes.

Q. Now, in table 17 your operating cost so called does not include in any case any three cents for reserve, does it?

A. No.

Q. Or anything else for reserve?

A. It assumes that 10.89 cents which is the average of the last twenty years is sufficient. There is some renewal in it.

Q. It takes the actual expenditures for renewals and repairs for twenty years and averages the actual expenditures?

A. Yes.

Q. With nothing added for reserve or contingencies to your average?

A. Yes, that's right. That is what I stated in the evidence.

Q. You have computed a further and larger capital than any of the figures appearing on Tables 16 and 17, if I understood you correctly, amounting to about $53,600,000, by taking Mr. Wheelock's valuation for the land, Mr. Mayer's for plant and holders, Mr. Humphreys for mains, Mr. Simpson's for services and Mr. Carter for meters and other personal property?

A. Yes.

Q. But you did not include in that connection the entire working capital that the company claims, did you?

A. No. I think I was trying to give the structural assets that could be compared with the 1884 valuation.

Q. You did not include any working capital, did you, in the $53,600,000?

A. No, I don't think that was included in either. I think not, but my object was——

Q. Well, be sure on that because my recollection is you included $1,000,000. I am not quite sure about it.

A. I think not.

3362 Q. You think not. Very good.

A. Subject to correction afterwards.

Q. And you did not include the value of the franchises?

A. No.

Q. Nor any investment representing the plant which is producing the 3,000,000,000 feet or more which the Company now purchases?

A. No.

Q. Nor the National Coke & Coal Company?

A. No.

Q. Now, as to the Astoria plant, you heard the testimony that according to the estimates of the Company the first two units would cost, say $21,000,000, and there would be a loss, if we removed to Astoria our manufacturing plants, after we had produced there the gas which we were purchasing from other sources now, of about ten million dollars or something like that. You remember testimony substantially to that effect, do you not?

A. Well, I cannot commit myself to any definite statement of figures because there have been so many different computations at different times as to the matter. For example, the extent to which the property in New York is going to be "scrapped" has been variously estimated at various times by the witnesses for the complainant, so that I haven't in mind what is exactly the official and final statement of the company.

Q. Well, as a matter of fact, you have always contemplated that about $10,000,000 of the $20,000,000 or $21,000,000 that these two units in Astoria will cost will ultimately be added to capital, haven't you?

A. I have contemplated that the coal gas works at 14th and 42nd Street- would doubtless be abandoned as far as making gas is concerned, if the Astoria plant went into operation.

Q. That is not quite my question. Have you contemplated that

3363 upon the completion of the second unit in the Astoria plant, about ten million dollars of that expenditure would be capitalized, even if the balance, that is, the other ten million dollars or such a matter be taken care of by a depreciation fund or otherwise?

A. I may have testified in the previous case along that line. I don't remember distinctly.

Q. Well, I don't ask you at the moment whether you so testified. I asked whether you did not so contemplate in your testimony?

A. Well, I had at first supposed there was to be a very much more extensive removal to Astoria than the later evidence has appeared to indicate.

Q. There may be still, if we convince the Court that we are not getting a fair and reasonable return at eighty cents, so don't follow that assumption completely.

Mr. Burr: So far as the evidence here is concerned, it is doubtful whether the Astoria plant is to be in supplement of the present plants or in substitution of them.

Mr. Mathewson: I think it is quite clear that the first unit of four billion feet will be required to produce gas which we procure elsewhere but which we sell, which is beyond the capacity of our present Manhattan plants; and the second unit is a replacement of certain of the Manhattan plants, whichever may be the most economical to replace when the time comes. But the replacement and the construction of the second unit, I am frank to say, depends largely on the outcome of this litigation; necessarily so.

The Witness: I haven't seen any evidence in the case about the reasons for dropping the contracts with the companies with which you have agency agreements, the subsidiary companies.

3364 Q. Fortunately, we have directors who have that matter in charge and we do not have to worry about it. But I ask you if in your testimony and computations before the Gas Commission, you did not contemplate that ten million dollars of this twenty million dollars expenditure at Astoria, for the first two units, would be capitalized?

A. I think I did.

Q. And if the assumption comes true that the first two units will be completed there and that they will be employed as has been discussed, then $10,000,000 would have to be capitalized, would it not, producing an additional capacity beyond the present sales of the Consolidated?

A. Whether it would be all for the consumers of the Consolidated Company is now becoming doubtful in my mind.

Q. Well, if it is capitalized, we will assume it could not be capitalized except properly?

A. Yes, but not necessarily all to be borne by the consumers of the Consolidated Company.

Q. I will say the consumers of the gas which is produced at the Astoria plant; all the consumers?

A. Yes.

Q. And it would be capitalized, would it not, no matter who the consumers were?
A. Yes.

At 4:45 P. M. adjourned to October 25, 1906, at 12 o'clock.

Last Exhibits:

Complainant's, 256.

City's, 59.

3365 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIEN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *Thursday, October 25th,* 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

3366 Continuation of the cross-examination of **EDWARD W. BEMIS**:

By Mr. **MATHEWSON**:

Q. Professor, yesterday we referred to your computation of $53,600,000, value of land, plant, holders, mains, services and meters, but excluding working capital, National Coke & Coal Company, Astoria, good will, etc.——

A. May I state, before you ask that, that I think I presented the exact figures with some degree of qualification, that they might be slightly modified by further computation.

Q. Oh, yes, I understand that.

A. And that was just a summary.

Q. I quite understand that. But from that you made this deduction. You figured by starting with Exhibit 79 in this case a valuation of about $40,000,000, taking the appraised value of the property taken over by the Consolidated in 1884 at something over $30,000,000, and adding to that $9,000,000 and more of additions which have been made since. Now, deducting this $40,000,000 from $53,000,000, you obtained a difference of something like $13,000,000, and you proceeded to deduct that $13,000,000 from the $17,392000 of renewals and repairs which are shown for the past twenty years, and obtained a balance of $4,676,497. Now, did you make that deduction on the theory that any part of the 10.89 cents during the past twenty years, representing renewals and repairs, had gone into increase in plant, increase in construction?

A. I had an opinion on the subject, and I——

Q. In making this computation and your deductions therefrom did you consider and were your deductions based upon the fact in any degree that some part of the 10.89 average renewals for twenty years making up this $17,392,000 altogether went into additions to plant or new construction? 3367

A. I have found no evidence on the subject. I will tell you what I used in my computation.

Q. Well, did you assume that to be the fact in making these deductions, or did you not?

A. I did not consider it material either way, although I had a belief on the subject; that is, very material.

Q. Well, it may be material to you, but I do not think it is to us. You did not take that into consideration at all, then, as to whether it had or had not gone into construction?

A. I wanted to know the fact, and hoped the accountants would bring it out.

Q. But you say it is not material whether it is or not ?

A. I changed that a moment later and said very material. It is not indispensable, but it has a bearing, of course.

Q. But in making this deduction and your reasoning thereupon did not assume that any part of it had gone into new construction, or did you not, so far as it is material at all?

A. My testimony shows that I merely stated that if the value of the plant was so much greater than it was formerly, the appreciation must be set off against any claim of depreciation, and so far as it came near balancing the 10.89 cents, so far should it be set off.

Q. And it does not make any difference in your judgment whether that appreciation is due to the natural increase in the valuation of land or whether the appreciation of $13,000,000 which you have computed came out of the consumers of gas, does it, so far as your theory is concerned?

A. It does make a difference whether it came out of the appreciation of land and paving or whether it came out of the improvement of the value of the plant itself. And I only went so far in my statement as to say to the extent to which the courts might allow or the company might establish a claim to that appreciation, 3368 to that extent was the 10.89 cents too high. But I do, in my own opinion, make quite a distinction, as I have repeatedly said, between the appreciation which comes from land and that which will come from the plant.

Q. We will assume that no part of this 10.89 per thousand, representing renewals and repairs for twenty years, did go into new plants, but that the books were kept in the approved method which you and I agreed upon the other day as the proper method——

A. I don't remember whether we agreed upon it absolutely.

Q. Well, I think we did.

A. Well, I will leave that to the evidence.

Q. In that case, would that make any difference in your conclusions on this subject?

A. Not if the Court is going to allow the appreciation.

Q. Now, as a matter of fact, Professor, you found that this increase which you have computed, consisted almost wholly of the increased value due to the new paving so far as it related to mains and services, and to the increased value of the land by reason of lapse of time, whereas, the plant and holders and meters and other personal property showed little, if any, increase over the book value. You remember that, don't you?

A. No, I do not. I will look at it again. Just a moment, I want to find an exhibit in the case which——

Q. Let me call your attention while you are looking at it, to one or two circumstances which may refresh your recollection. You remember the improvements were carried on the books of the company at about $7,850,000, whereas the cost of reproduction was given as $12,636,000, or nearly five million dollars more than this sum?

A. It appears from Complainant's Exhibit 79, page 347*a*, 3369 that there was a net increase of plant of $3,904,000, but I have somewhere, I don't know that I can lay my hand on it at the moment, that there was a very much larger increase than that in the valuation put by Mr. Mayer on the plant compared with the Rowland valuation. As I have it here, there is nearly $7,000,000 increase in said plants, meaning the manufacturing plant and holders, I believe.

Q. What did it appear to be on October 31, 1905, after adding the additions since 1884?

A. $16,087,000.

Q. What was Mr. Mayer's valuation?

A. That was, if I understood it right, about $19.115,000, including holders.

Q. That it was what—$19,000,000 and what?

A. $19.115,000 for the plant.

Q. And that would show an increase of only $3,000,000, because, you remember, the figures you deducted from the $50,000,000 to reach this $13,000,000 were the totals shown on this Exhibit 79?

A. Yes, it would be about $3,000,000.

Q. The mains show here on Exhibit 79 as about $7,850,000, do they not, or something like that?

A. Yes.

Q. How near right is that?

A. $7,852,151.03.

Q. And the cost of reproduction was testified to be about $12,636,000, I think.

A. Yes.

Q. That would be an increase of nearly $5,000,000 in mains, wouldn't it?

A. Yes.

Q. And for services, they were stated to be $1,212,000 on Exhibit 79?

A. Yes.

Q. And the cost of reproduction was $1,994,000?

A. Yes.

Q. That would mean about $775,000, wouldn't it?

A. Yes.

Q. Now, if you take land, what does it appear to be car-
3370 ried on the books at by Exhibit 79? $10,920,000, isn't it?

A. Yes.

Q. What is the appraisal of Mr. Wheelock that you took ?

A. $15,651,500.

Q. Well, that is something more than $5,000,000, isn't it?

A. Yes.

Q. So that taking these three items of land, and mains and services alone, we have about $11,000,000 out of your $13,000,000 increase?

A. Let me see, the plant and holders as I have them here were as follows, according to Mayer. The holders I get from pages 1348 to 1356 as $3,600,215 and the plant I get according to Mayer in the same testimony after deducting as he did 3.9 per cent. for depreciation, he got the present value, as I understand him, $15,515,578, which made $18,115,793, while I understood here that the plant was valued October 31st, 1905, at $16,087,428.72. That meant an increase in that item of $2,028,364.28.

Q. Well, you have pursued that far enough, Professor. Assume that your figures are correct, and I am not going to review them at present——

A. There is quite a difference on meters too.

Q. That would mean a difference, adding this $2,000,000 and more which you have just now suggested for plant, to the $11,000,000 or thereabouts which we have accounted for of land, mains and services, and you get about $13,000,000?

A. There would be about $1,000,000 on meters——

Q. Oh, no, you had better look at that again. Don't confuse yourself.

A. Well, there must be a mistake, yes.

Q. The meters and other personal property showed on Exhibit 79 $3,802,000, if my recollection is correct, whereas the cost of reproduction to-day was testified to be only about $4,200,000, or a very
3371 small increase.

A. Meters and other personal property, that was.

Q. Certainly, so there is not a great difference there. But these items we have gone over account for all of your $13,000,000 and a few small items outside. Is it not apparent on the face of these figures that most of this increase arises from the increase in the value of the land and from the increase of cost of reproduction of mains and services over the cost of original installation?

A. Most of it does.

Q. So if that be the case, it would be impossible that a great amount of that increase could have come from the employment of any part of the 10.89 cents towards new plant and new construction, would it not?

A. I have no sufficient information at the present moment to determine whether in the case of the mains and services the considerable increase is entirely due to the question of paving or whether quite a sum of it is due to other factors such as connect themselves with the pipe itself, the physical property aside from the paving, so that not being able, not having that data in mind even if it had been given, which I am not sure, I could not directly answer your question, I don't think.

Q. It appears, however, does it not, that if no part of the 10.89 cents expended for repairs and renewals per annum on the average during the last twenty years, went into additional construction, no part of this increase of plant, whatever its cause, came out of the consumers of gas?

A. If none of it did come out; it did not come out; that is a truism.

Q. And there is no evidence that it did come out of the consumers of gas unless it was included in this 10.89, is there, so far as you have seen it?

A. That is the place it would come from, I should suppose, if anywhere.

3372 Q. Now, Professor——

A. I would like to qualify my last statement by saying that it would naturally come out of the 10.89 cents. Of course, not being acquainted with the books of the company I cannot say positively how it was financed.

Q. Well, we will leave it that way, naturally. You have stated that you have been connected with water companies, and that they also have pipes and mains the same as a gas company, and that to the extent of that distributing system, there is some similarity?

A. And there are others, in meters and many other directions, distribution expenses quite largely.

Q. Now, as a matter of fact, you have read the testimony of Professor Marks, that the cost of installation of our mains and services, as they appear upon the books, and as they appear upon Exhibit 79, are correct and moderate, as he states?

Mr. Burr: So far as his information went. He had no knowledge of the maps of the mains or other information.

Mr. Mathewson: Well, he said he had made a computation, and assuming the mileage of mains to be as stated, that the figure on the books of the company which is on Exhibit 79 as to original cost of installation was fair and moderate, or correct and moderate.

The Master: All that he said and assumed is in the book of testimony, and what is the use of spending time discussing about it? If you can turn to it and ask it in the language of the witness, so much the better. If not, we will have to let it go subject to my correcting it.

Mr. Burr: On the assumption that what Simpson testified in regard to the mains was correct, Dr. Marks made certain remarks.

3373 Mr. Mathewson: Well, we will call attention to Dr. Marks' affidavit, page 49——

Mr. Burr: He called attention to it himself.

Mr. Mathewson: Yes, so he did. In which he says, "Referring to the affidavit of Colin C. Simpson, Superintendent of Mains and Services of the Consolidated Gas Company, I would say that I have carefully recomputed the cost of the mains owned by the Consolidated Gas Company from the inventory given by him, and I am of the opinion that the cost of installation, as given on the books of the company—probably correct and moderate."

Q. You read that, didn't you, Professor?

A. Yes.

Q. Now, you also noted his statement that he had checked Mr. Simpson's estimate of the cost of reproduction at $12,636,150.04 similarly, and that list also seemed to be "moderate and fair." And that he also then took up the subject of services including the curb box and stop valve and stated that they corresponded very closely with the average experience as to the cost of installation, and that he considered that to be "moderate and correct."

Mr. Burr: All on the assumption that Simpson's statement was correct.

Mr. Mathewson: As to the mileage and size of mains, of course.

Q. Now, you also before the Gas Commission made a computation as to the cost of installation of the mains of the Consolidated Gas Company which you stated appeared reasonable from all that you could gather, didn't you?

A. Well, will you read what I said?

Q. "The value worked out on the basis of the unit values
3374 used in 1884 (this is 1904 here by mistake) the mains were
probably laid in New York before paving was put down in most cases before even cobblestones or macadam, so that the book values would appear reasonable from all that I could gather." Is that correct?

A. Yes, I think I said that.

Q. And your computation at that time upon the unit value which you assumed, produced a total for mains, did it not, of $8,396,698 or a little beyond the book value?

Mr. Burr: Is it page 1255 of the Gas Commission testimony?

Mr. Mathewson: Yes.

A. What I did was to take the present sizes and the cost per foot in 1884, as given by Rowland, and computed that if there had been no depreciation whatever new mains would now be worth on the basis of 1884 prices $8,400,000.

Q. And did you not say that that appeared to be reasonable?

A. If you find it there. I don't remember.

Q. Well, I just read your testimony.

A. Well, I assented to it as read.

Q. "So that the book values would appear to be reasonable from all that I could gather?"

A. Yes.

Q. And you found that those figures differed very little from the figures upon which all the experts, you agreed, testified in the Boston appraisal as between cobblestone and macadam or something of that sort?

A. It was about equivalent to an average between the cost of the two.

Q. So that as far as your experience was concerned applying to the Gas Company, that is the laying of mains, the book value appeared to be fair and reasonable as to cost of installation, not cost of reproduction, to-day?

3375 A. Yes, that is what I stated. I have to correct a statement that I assented to a moment ago as to figures I think to a slight extent. I implied that the $2,000,000 difference in plants—$2,000,000 higher value in plants according to Mayer, than the valuation October 31, 1905, was practically the only difference outside of land, mains and services, but I find instead of there being only $2,028,000 difference in the total, outside of land, mains, and services, there is a difference of $3,325,819. The total as given by your various witnesses exceeds the valuation of October 31, 1905, as it appears on Exhibit 79 outside of lands, mains and services by $3,325,819, omitting the odd cents.

Q. That is according to your computations from their testimony, is it not?

A. I took the total as given here in Exhibit 79, $30,883,984.91, being the valuation in 1884, plus the net increase of $9,693,565.90. That brought it up to the figure just quoted of $39,883,984.91. I deduct that from the $53,461,327.00 as the recent appraisals which leave an excess not accounted for by the construction account of $13,577,342. But of that amount the increase in the real estate, mains and services was $10,251,523, not accounted for in the construction account, and taking that out left a balance of $3,325,819. I may say that in using those figures I took the round figure for mains at $12,600,000 that Mr. Humphreys testified to, instead of taking the $36,500 more which I think was the exact figure of Mr. Simpson.

Q. Now, you subsequently used the $36,500 in getting your computation?

A. No, I mean in this computation.

Q. But there is a difference of a million dollars, and the only item you have not included in your computation are meters and other personal property, which are carried on the books at $3,802,000, the present value of which was stated to be only $4,200,000 or
3376 $400,000 increase, so you have made some error in your
computation, but it is not material to my present point and I will not pursue it. You can see in a moment there must be a difference which will appear when you go over your figures. Now, taking up the subject of capitalization per thousand of output, you have already shown on your table that the capitalization in Boston, as fixed by the Act is $4.26 per thousand of output. Is it not a fact——

A. Where have I stated that?

Q. In your table which you presented. You have also stated that there was an appraisement there. That appraisement, as a matter of fact, whether it was accepted by all parties or not, was at a very much higher figure for the value of the property than the amount of the capital stock, which was only $15,170,000 under the Act, was it not?

A. An appraisal was brought in which was disputed and never came to a final issue.

Q. But it was an appraisal which if it were true showed the value of the property to be in Boston $24,000,000 or $25,000,000?

A. Yes. Hardly any deduction was made for depreciation or duplication, or because the mains were duplicated.

Q. Yes, I understand that is your belief, but there was no deduction?

A. No.

Q. But taking things as they stood, cost of reproduction, it was about $24,000,009 or $25,000,000, according to the appraisal?

A. I don't remember just what the total was.

Q. It was over $20,000,000 considerably?

A. It was over $20,000,000, but there was a great dispute about it.

Q. I know. It was claimed some deductions should be made because the mains of companies duplicated in the street and some depreciation should come out, &c., but the appraisal as made by Mr. Humphreys as a practical gas man exceeded $20,000,000
3377 considerably?

A. My recollection is it was in excess of $20,000,000 but I criticise very much the appraisal.

Mr. Burr: Is that the same Dr. Humphreys who has testified here?

Mr. Mathewson: Oh, no; it was his brother, who is with the Lawrence Gas Company.

Q. Do you remember that the Brookline Company went into the City of Boston and paralleled the mains of the Boston Gas Light Company so as to give the people of Boston the benefit of competition at one time?

A. To some extent they paralleled.

Q. And so far as they paralleled the mains for that purpose some people objected to their capitalizing the mains which were able to produce this competition; you remember that, don't you?

A. There was criticism of that.

Q. Yes, and that was part of the duplication of mains that was objected to, although the mains were put down for the purpose of giving competition. Now, let us take up the City of Chicago. What was your estimate in the Chicago report to the City of Chicago as to the cost of duplication of the Chicago gas works?

A. I think I spoke of a new plant as $3.20 per thousand feet.

Q. That was for water gas, was it not?

A. Yes, but they had as many mains. They had twice as many mains—I had to allow for twice as many mains as New York.

Q. Yes, but a distributing system is not the greatest nor the most expensive part of the plant of a company when you come to compare it with manufacturing plant and land in a great city, is it?

A. I wouldn't want to answer that question offhand. That is a point of considerable importance and I would not want to answer offhand.

3378 Q. And the size of the mains might be very much larger in New York, although the mileage was less, might they not?

A. There might be of course a difference. The distribution system is by no means a small part of the total cost of the plant.

Q. Well, as a matter of fact, assuming the mileage to be greater in Chicago, the cost of laying mains in New York, in view of the rocks here, and the other obstructions, such as the old and narrow street and the congestion of traffic, is very much greater, isn't it, than it is in Chicago?

A. That is true of the rocky district, which is not, however, a large percentage here, if I recollect it is ten per cent., if I remember right, but I may be wrong as to the percentage. Most of the mains seem to have been laid in New York before the congestion became as great or the paving became as expensive.

Q. But taking the denser population of New York and the congestion of traffic on the streets, they would all tend to make the laying of mains in New York more expensive than in Chicago, wouldn't they?

A. I should think the cost of laying might be a little more, but I am not sure of that. Wages in Chicago are rather higher than in New York, if I remember the last tabulation of the United States Department of Labor; and, further, I rather think that pipe per ton would be a little cheaper in New York than in Chicago.

Q. Do you think it would right next to the Illinois Steel Company's plant?

A. Well, Philadelphia is a large maker of pipe right in this vicinity.

Q. Is it not so near this vicinity as the Illinois Steel Company's works are to Chicago?

A. No; not quite.

Q. Now, you are simply speculating. You have never laid any mains in Chicago, nor in New York?

A. I was considering your question. You were asking me to express an opinion.

3379 Q. No. I was merely asking you as to the cost of laying mains in Chicago and New York; if the cost of installing the system, of laying the mains, would not be much greater in New York than in Chicago?

A. I thought you included the mains themselves as well as the laying.

Q. No, I didn't ask any such thing, because I didn't think you were qualified to reply.

A. I laid over forty miles of mains last year.

Q. In New York City?

A. In Cleveland.

Q. I am talking about New York City. Don't you think the expense of laying mains in New York City would be substantially greater than it would be in Chicago per mile of main of the same size?

A. I think it would cost more to-day, but whether it did cost more when it was done, I am not at all certain.

Q. What about the streets in Chicago; aren't they very broad streets?

A. Yes.

Q. Ample room for trenches, without interfering much with traffic?

A. But labor is more expensive there. That is the trouble.

Q. I don't know whether it is or not. I am talking about one point. Assuming labor to be the same. And I don't think it is any higher there; I don't think it is so high.

Mr. Burr: Well, you are not testifying.

Mr. Mathewson: No, but I know just as much about it as the Professor does, and he is testifying.

Mr. Burr: I disagree with you.

The Master: Gentlemen, let us proceed.

Q. Well, I will read now from your Chicago testimony and ask you if you did not testify as follows:

"New York has a more dense population on the Island than
3380 Chicago. Yet, on the other hand, the cost of laying mains
is very much greater per mile of main because of the rocky
soil they have to blast, and the congestion of traffic on the streets and the greater quantity of good paving."

A. That is true to-day, yes.

Q. And the same was always true, as far as you know?

A. Yes, but the congestion was not.

Q. Do you know of any period when the congestion in Chicago, when they were laying mains, was as great as it was in New York City in 1823 when they began to lay mains here and at which time Chicago was a prairie?

A. I was talking about the cost of laying mains in Chicago to-day with the cost of New York as originally laid, I think.

Q. The capitalization of the Chicago companies is over $6.00 per thousand feet, isn't it?

A. I would not be surprised at that figure, but I don't remember exactly what it is.

Q. Didn't you so testify before the Gas Commission, at page 1436 of your testimony?

A. I don't remember that I did. If I did, all right.

Q. Won't you look at it (handing testimony to witness)?

A. Yes. You gave me the figure, did you not? $69,000,000, and I made a division for you a year ago.

Q. Something over $6.00?

A. That's right.

Q. Do I understand that in Chicago you were comparing the cost in Chicago at that time with the cost to the Consolidated Gas Company of its plant as originally established?

A. I don't remember now, but I thought I was comparing it with the testimony in the case as to the book value of those mains.

Q. Yes, but I ask you, taking the mains, whether you were 3381 comparing the cost of installing the system in Chicago at the time you testified a year ago with the original cost of installation by the Consolidated Company when it put its mains in.

A. I don't remember now exactly.

Q. Now, I call your attention to Mr. Cowdery's statement in Chicago, regarding capitalization per thousand feet of annual output——

Mr. Burr: You read considerable from Mr. Cowdery's statement yesterday and I might well have objected to it because he is not here as a witness and subject to cross-examination, but I will avail myself of the privilege that you took of reading other parts of that report, inasmuch as you read Mr. Cowdery's statement to such an extent.

Mr. Mathewson: If it comes under the legal rules of examination I do not know that I can object, and if I did, I don't know that I would be sustained. I call the witness's attention now to a statement of Mr. Cowdery and ask if he agrees with it and if it modifies his testimony.

A. What page?

Q. Page 21 as follows:

"Regarding capitalization per thousand feet of annual output, I will say that I have taken a company and replaced it absolutely from beginning to end, and I know positively that it would not be possible to replace the company here in Chicago with its first-class property and its business for less than five dollars per thousand feet of annual output. I would consider it a physical impossibility to replace the plant and business of the People's Company for $35,000,000."

3382 Q. Now, considering Mr. Cowdery's standing and experience as a constructor, and your want of it, in gas properties, wouldn't that modify your previous view that the plants in Chicago could be duplicated for $3.20 per thousand feet?

A. You notice he is not talking about the same thing.

Q. What is he talking about?

A. Property and business.

Q. Very good. Property and business. Do you concur with his statement as to that?

A. That I am not sure about, but it was not what I was talking about.

Q. You are not prepared to question it at this moment, are you?

Mr. Burr: He has not spoken of it.

A. I have not spoken of it.

Mr. Mathewson: The witness ought to testify, I think.

Q. I asked whether you are prepared to criticize that estimate at the moment?

A. I have found no data anywhere as to a matter of that character. I hold it is not a proper subject for capitalization. In other words, the capitalization of the consumer at so much a head is not to be found anywhere in either Massachusetts or Great Britain.

Q. Not even if five dollars per thousand feet was actually expended in establishing a plant and producing the business?

A. That went into advertising and operating expenses in the last fifty or one hundred years. It has been charged already, the consumer paid already for getting himself on as a consumer. Why should he be capitalized and pay interest on himself?

Q. (Question repeated.)

3383 A. I have answered. And I will say even if $5 was required to establish the plant and business, what was devoted to establishing the business should not be capitalized because it is already included in operating expenses.

Q. Of course it would bring something if you went to sell; an established business would bring more ordinarily than the mere structural value of the plant?

A. Probably.

Q. You made an estimate to the City of Montreal, I think quite recently, as to the establishment of a plant there. Do you remember what your estimate per thousand feet of sales was for that plant?

A. Not exactly. I will look at it and verify the figures.

Q. Will you look at it and see if it was not $4.30 per thousand feet of sales?

Mr. Burr: What relevancy has that unless the conditions are the same there as here?

Mr. Mathewson: Well, the Professor has been referring to other cities.

The Master: The same might be said, Mr. Burr, of a good deal of the testimony here.

A. I did. Shall I explain why there is that difference?

Mr. Burr: Yes.

Mr. Mathewson: No. Not yet. I have the witness just at present.

By Mr. Burr:

Q. But you can explain later.

A. Later.

By Mr. Mathewson:

Q. You also testified in Baltimore, quite recently, didn't you?

A. Yes, sir.

Q. Within the past year?

A. Yes; in the early spring.

3384 Q. In that case you were testifying for the city which was trying to sustain an assessment on taxes which was claimed by the companies to be high, weren't you?

A. Yes.

Q. And in that case did you not estimate the value of the property of the Baltimore Gas Company by taking the net earnings of the Company and multiplying them by twenty, and state that to be a fair basis for reaching the valuation of the entire property?

A. I think I did. That is Mr. Humphrey's basis in Holyoke.

Q. Then you quite approve of that basis of taking the earnings of five per cent. and multiplying by twenty in order to get the value of the property?

A. The Company in Baltimore had no inalienable right to continue to earn on that, but as long as it was earning on that basis the city had the right to tax it on that basis.

Q. Well, we all have inalienable rights, Professor, we hope. I desire to ask you if you testified as follows in Baltimore (pages 282-283):

"Q. Kindly state in detail how you arrived at your valuations? A. I first took into consideration what should be the value of a gas company which divided in a certain year earnings of $928,410 and which, in addition to that, added somewhat to its surplus. I have for years been studying the relation of the dividends and interest or divided profits of gas companies to their total values, and I have found that in large cities of the East, such as Boston, New York, Philadelphia, Washington, and Brooklyn that the Company is worth more than twenty times its divided profits, that a capitalization of five per cent. is a very conservative capitalization; in the larger gas companies of the East based upon the profits which they yearly divide. So that I approach the subject from
3385 the standpoint of the customary rule in gas companies
* * * I considered five per cent. very conservative but not unduly so perhaps for this investigation. Four and one-half would be a little too low, and so I took five per cent. as a basis of capitalization, and that gave me $18,568,200 as the total value of the property."

On cross-examination by Mr. Gans (page 294) you were asked:

"Q. Then you capitalized the divided profits at five per cent.? A. Yes, sir.

"Q. Your theory of capitalization being that from your experience in gas companies you say the value, the total value of the property is twenty times the divided profits? A. Yes, sir.

"Q. When you say the total value of the property of the Gas Company, you mean all that it owns? A. Yes."

Mr. Burr: Is that the same Mr. Gans who appeared here?

Mr. Mathewson: I don't know.

The Witness: No.

Mr. Mathewson: Subsequently, at page 296, you said:

"A. Except that I should add * * * that I took a very conservative figure at five per cent., particularly in the case of a Company which has so large a surplus; many of those companies worth twenty times the divided profits which do not have large surpluses, so that I would not make the absolute assertion that twenty was quite a large enough amount, but I took it in order to be rather conservative."

3386 A. It shows how much more conservative I was here when I take six per cent.

Q. Yes. Then you were asked:

"Q. State what a purchaser would pay for the property at a fair sale?. A. I believe that he would capitalize the earnings that it was making and consider that he was thoroughly justified on that basis if he should only expect five per cent. on these earnings on the purchase price, but he would have almost conclusive reasons, from the experience of other States to expect a growth in that business with the growth of the city," and so on.

Now let us capitalize the Consolidated Gas Company on the basis of twenty times its earnings, which you stated you thought was rather low; and will you look at Exhibit 96 and see what the earnings of the Company were for the last year? Exhibit 96 shows net earnings of $4,587,955.99. Of course the earnings are a good deal larger than that if your estimate of the proper cost of gas was correct, but we will take those modest earnings?

A. That makes $91,759,919.80.

Q. Have you ever taken occasion to note the average structural value per thousand feet of sales of all companies operating in the United States, and if so, I will ask whether the statement in this table appended to this Chicago pamphlet which is $7.23 per thousand feet accords with your information?

A. I have been looking for it lately. I don't know whether I brought with me the census bulletin which you refer to; which would bear on that, I mean.

Q. It is already in evidence that the average capitalization per thousand feet is $8.47 and this refers to the structural value per thousand?

A. I have left at the office, I think, the census bulletin.

3387 Q. Isn't it your recollection that that is about it?

A. I don't recall now. I remember looking it up and finding that it was much larger in the United States as a whole than it was in Massachusetts, owing to the way they have of padding their assets to make them conform to their watered stock.

Q. Have you ever kept any books for any gas company in the United States?

A. No, but I know how they do it.

Q. Then your views as to how much they pad it is largely hearsay—wholly so, isn't it?

A. I don't know what you mean by hearsay. I have not done it myself.

Q. Exactly. Referring to this Chicago report again, I call your attention to page 35 and ask you whether this is not the summary of the Commission:

"A brief explanation is presented, showing the course of reason followed by your Committee in arriving at the price of 85 cents. The cost of manufacture and distribution is taken as indicated by the report of the auditors; 45.4548 cents. This, the auditors state, includes 6.0043 cents for repairs and renewals. Messrs. Bemis, Cowdery and Humphreys practically agreed that 10 cents is a fair allowance for current repairs and renewals. The difference between 10 cents and 6.0043 cents is 3.9957 cents, which is added as additional allowance in order to make the full 10 cents. This gives 49.4505 cents as the cost of manufacture and distribution, including current repairs and renewals. This is approximately 50 cents, and we so call it for convenience. A reserve of 5 cents is added for contingencies. Mr. Cowdery and Mr. Humphreys agreed that $5.00 per

thousand cubic feet of gas sold is a fair allowance for capi-
3388 talization, representing structural value and working capital
to secure the business. Upon this we allow an income of 6 per cent., or 30 cents per thousand feet. In this way a total cost of 85 cents is reached."

Have I quoted you correctly?

A. Yes.

Q. And you observe that thirty cents per thousand feet was allowed by the Commission in their estimate?

A. Yes.

Q. And six per cent. on the capitalization of $5.00 would be just the same as eight per cent. on a capitalization of $3.75, wouldn't it?

A. They may have vetoed the bill. They passed it over the veto.

Q. This report has been presented here by the Council for the City and we are making use of it accordingly. Now, taking the fifty-five cents which you estimated as the cost of gas in Chicago, assuming that the cost of oil in Chicago was as you stated, according to your best information, and in New York was only four cents, which would make a difference of over one cent for each gallon of oil, that would make a difference in the cost, would it not, of about five cents per thousand feet, about five gallons of oil being required for each thousand feet?

A. Yes; about five cents; between four and five.

Q. But if the Consolidated Company properly pays say four and one-half cents as against three cents in Chicago, that would make probably more than five cents?

A. I have forgotten this estimate, whether the oil is four gallons or five when distributed over the entire amount made.

Q. You testified, I think, before the Commission that it was four and three-quarters or five?

A. Yes, I know it. It was not very much. I didn't want to commit myself to an exact figure without verifying it from your exhibit.

3389 Q. Precisely. And you found or estimated that the taxes
in Chicago were about five to five and one-hall cents?

A. I think it was five and one-half.

Q. While in New York, upon your own theory, they are a little over six?

A. Yes.

Q. And if we are entitled to charge interest on unpaid taxes into the construction cost of gas it would be six and three-quarters or something like that?

A. If your property is anything like this figure of course——

By Mr. BURR:

Q. What figure are you referring to?

A. The figure of capitalization at five per cent. of net earnings, $91,759,919.18.

By Mr MATHEWSON:

Q. Well, the taxes then in Chicago are less than they are in New York upon any theory, to some extent?

A. Yes, I should think they were.

Q. And your computation of the cost of "Other Items of Distribution," after you had eliminated certain items, was for Chicago, about 5.7 cents while New York showed an expenditure of 9.5 cents for the same items; you remember that, do you not?

A. Yes.

Q. There is a difference of something like four cents. So that if the expenditures of the Consolidated are proper and prudent you would have in the cost of oil, and in additional taxes, and in the additional expense of distribution of these "other items," an excess of ten cents beyond the Chicago cost?

A. On all those suppositions I should say, yes. Of course that does not take into account other facts such as the larger density in New York and other things, but on that supposition it is correct.

3390 Q. Oh, yes, it does, because we are talking about the operating amount of cost and I am assuming that the expenditures of the Consolidated Company were fair and prudent, as I stated?

A. Yes.

At 1:15 P. M. a recess is declared until 2:30 P. M.

After Recess.

EDWARD W. BEMIS resumed.

Mr. MATHEWSON: Professor Bemis, I find you quoted on page 16 of the Chicago pamphlet as follows: "For taking care of ultimate depreciation I accept the standard established by Alexander C. Humphreys, the best authority I know of in the gas world." Is that correct?

A. That is a quotation from a letter of mine to the City Council of Chicago, I judge. You have not finished the sentence, have you?

Q. Yes. It merely follows with a statement as to Professor Humphreys' testimony in the Holyoke case. I also find on page 18 the following statement: "I don't know of any gas company that was successfully floated on a basis of six per cent. of its structural value with the exception of Cleveland. I don't know of any gas company which started in and built an entirely new plant on the basis of $3.20 output, which was floated on a six per cent. basis?

A. Don't I go on to say——

Q. No matter what you went on to say. Do I quote you correctly so far?

A. That was quoted correctly so far as it went.

Q. I also find you quoted on page 19 as saying: "A five per cent. bond will float at par and a seven per cent. stock will float at par in the gas business."

3391 A. I don't remember whether I said seven or not. It is so quoted there as a synopsis of my testimony.

Q. Have you any doubt about it?

A. I should have thought I said six; I usually do.

Q. Won't you see if immediately following that you did not get your six per cent. by assuming that the company would issue bonds and borrow money from the public at five per cent. for one-half of the plant and issue stock and furnish the money themselves for one-half at seven per cent., which would make an average at six per cent.?

A. Yes, sir.

Q. Instead of furnishing all the money themselves and issuing all the stock, as we will assume they might have done?

A. Yes.

Q. Now, will you look at Exhibit 85 in this hearing, referring to the increase of output of gas, and tell me what the output of the Consolidated Company was in 1893?

A. 6,854,014,000 feet.

Q. Take five years later, 1897, or covering the five years' period——

A. That is four years later.

Q. Well, four years later, what was the output then?

A. 6,790,864,000 feet.

Q. Practically the same thing, wasn't it?

A. Yes.

Q. What was the output in 1894?

A. 6,731,325,000 feet.

Q. And it is a fact, is it not, that the output in 1897 was less than it was in 1894?

A. The sales were less by 59,000,000 feet, as appears by that exhibit.

Q. Oh, certainly. Don't you think that the business depression which began in 1893 and 1894 and continued until 1897 was responsible for the failure to increase?

A. Why, I think it was, as far as my present knowledge goes.

Q. On the other hand, don't you think that prosperity is responsible for a very large increase in the sales of gas in a period of prosperity?

A. I think it is.

3392 Q. Is it not true that hard times result in economies in the purchase of gas, the same as economies in the purchase of any other commodity on the part of consumers?

A. And also on the part of the gas company, both, I think.

Q. If the gas company can, of course.

Mr. Burr: Or if the consumer can.

Q. But won't you confine yourself to my question. Let us not reason about it now, let us get down to the fact?

A. In hard times all prices and all labor are likely to be lower than in good times. Consumption is likely to fall off.

Q. Well, it may be likely to, but it is a question of fact here, Professor.

A. It remained about stationary there in gas.

Q. Let us look at City's Exhibits 57 and 58 in this hearing, that is the charts purporting to show "Effect of Price Reduction in New York" for Exhibit 57 and "Effect of Price Reductions in Boston," Exhibit 58. These relate, do they not, to gross sales?

A. Yes.

Q. What effect would the period of prosperity which began in 1897 and which has existed up to the present time have on the ability and inclination of consumers to purchase gas?

A. Other things being equal, it tends to increase the consumption of gas.

Q. What effect would the coal strike of 1902 and 1903 have on the consumption of gas?

A. Other things being equal, it would have a tendency to increase the consumption.

Q. What effect would the fact that the winter of 1902-3 and the winter of 1904-5 were the two coldest winters on record consecutively in the City of New York have on the sale of gas?

A. I am not sure.

Q. Don't you think that would tend to increase the consumption of gas?

A. I am not sure.

3393 Q. It certainly would if it were to be largely used for fuel, as you have indicated, and in open grates?

A. I am not sure. I will explain why I am not sure if you wish.

Q. Well, do so briefly.

A. From my own experience in the use of gas and from the experience of many others, there is more and more a tendency to use gas in the fall and spring and start the coal furnace later. Now, if a cold spell began earlier and quickly, one might more quickly proceed to a coal furnace or steam heat or something of that kind, and not continue so long with gas logs and grates.

Q. Don't you know that taking private houses which are heated by furnaces in the City of New York, very few of them indeed have gas grates, and that substantially all of them, if they have grates at all, have grates for coal or wood, more expensive forms of heating?

A. I suppose there may be a great many asbestos grates, and I used that expression interchangeably with logs, any form of heating the room.

Q. Don't you know the rooms which are fitted with gas grates are largely appartments where they are not heated by a furnace at all but by steam?

A. The same would apply to steam as to a furnace. I intended to make that change a few moments ago.

Q. So that in these apartments where open grates are largely used they could not turn on the furnace in the winter, because there is not any furnace. They would have either to turn on the steam or use the gas logs?

A. And I used it interchangeably for steam heat or a furnace. If, for example, the cold weather came on very sharply, the steam might be turned on for the building while in the intermediate weather between the warm weather and the time when the heat was put on in the basement there would be the use of gas for heat.

3394 Q. You have not in your testimony referred to the increase of population particularly. Does not the increase in population result in the increased consumption of gas even if the total sales per capita remain the same?

A. Yes, I looked into the figures in the Borough of Manhattan to some extent, and did not discover any large percentage of difference in the five-year periods from 1885 to 1905.

Q. Don't you think the occurrence of a period of great prosperity and of the two coldest winters on record and of the coal famine in the period from 1901 to 1903 would of itself, naturally result in a large increase in the output of gas quite aside from any change in price?

A. My testimony provided, for that——

Q. Just answer that if you will?

A. Yes, in my testimony I made allowance for that.

Q. That would explain this point on Exhibit 58, would it not, where it runs up in 1902?

A. Yes, I said so in my direct testimony.

Q. As a matter of fact, if the price had remained the same you would have expected this line showing the increase in the gross consumption of gas to rise constantly, due to the increase in population and to the period of prosperity?

A. But not as much as it has risen?

Q. But won't you answer my question?

A. I did. I said yes.

Q. Well, don't say "but." I am asking you for facts, and you have enunciated your theories before. Now just answer my question.

A. I was afraid my answer would be misleading.

Q. Don't think so. I want you to take the theory——

A. Mr. Mathewson, sometimes my answers have been quoted by you, and I can see by reason of not making them full enough they have misled you.

Q. You are entitled to have any explanation on the redirect that your counsel deems proper. Won't you look at Exhibit 58, 3395 from 1893 to 1895, two years, and say whether that does not show quite a sharp rise in consumption?

A. Yes.

Q. At the same time there was a drop in price?

A. Yes.

Q. But the drop in price ended at the same time as this particular rise, that is 1895?

A. Yes.

Q. What became of the momentum which you have said would carry the rise on continuously for some time farther?

A. It was temporarily checked by the hard times, so far as I can tell.

Q. Well, but it kept going up to the end of 1895 when the hard times were half over, and then continued at about the same rate until 1899, although that included two years of the good times, didn't it?

A. I am not quite sure how good the times were between 1897 and 1898.

Q. Don't you remember that from the time of the election of McKinley in November, 1896, that a period of prosperity set in, not because of that election, perhaps, but as a matter of fact. Don't you remember the date?

A. I remember the date of his election and that good times began soon afterwards, but I don't think the good times were especially felt by the gas users so quickly as you speak of.

Q. Let me ask you this. Beginning with 1901 and running to 1902 when the price of gas remained precisely the same in Boston don't you find a sharper rise than occurred between 1893 and 1895 when the price of gas was reduced?

A. I think it is slightly sharper.

Q. So, too, Professor, taking Exhibit 57 in the City of New York, is it not true that the increase in the sales of gas from 1901 to 1904, while the price of gas remained stationary in New York, shows just as sharp a rise as from 1899 to 1901 when the temporary reduction in price took place?

A. Yes, it was the period of the coal famine.

3396 Q. Not all of it, no. And the rise before the coal famine began, that is from 1901 up to the beginning of 1902, is just as great, is it not, as it is from 1902 up to 1903?

A. Well, I think the momentum of that previous price reduction was felt.

Q. But we saw that the momentum failed in the case of Boston entirely, so it would not be accepted as a general rule, would it?

A. No, I don't think it changes the general rule. I did not state in my direct testimony that the question of price was the sole factor, but it always was a force in operation; it might be temporarily counteracted.

Q. And you do not think it makes any difference how much gas a community is using per capita, you still think there is just as big a chance for increase and that an increase is just as likely, do you?

A. Yes, up to a point where we will say all conceivable uses of gas had taken place.

Q. Don't you think in a city like New York, judging from your observation, that gas as an illuminant as distinguished from its use as fuel has seen its best days?

A. That is uncertain. It was thought so when electric lighting was first introduced, but the contrary has occurred and now the Welsbach burner has come in and there are improvements being made in the use of burners, so I am not prepared to say although I do think that the greatest future of gas lies in fuel.

Q. And you do know by your own observation along the great commercial streets of New York that electricity has virtually superseded gas as an illuminant in the shops and in the department stores so far as you can see, has it not?

Mr. Burr: You mean for signs?

Mr. Mathewson: Yes, for signs and illumination.

3397 The Witness: I cannot say that.

Q. You have not observed that?

A. Why, there has been a more rapid increase of electricity than in gas in illuminating stores but I am not prepared to state that the increase in gas for lighting has not continued through the last twenty years of electric competition. I believe it has. I do not think by any means all the increase in gas has been in fuel.

Q. Well, electricity as a real competitor has made its best strides, has it not, within the last five or ten years?

A. Yes. I make the same remark referring to the last five or ten years.

Q. You referred to the high buildings. You know the high office buildings downtown are virtually all lighted by electricity and not by gas?

A. I think most of them are.

Q. So that would not add anything to the requirements of gas?

A. For lighting, yes, that is true.

Q. You know that is true of the apartment houses generally being put up, that they provide for electric lighting, with gas logs and ranges?

A. I thought they were usually piped for both, that is, piped for gas, and wired for electricity.

Q. Your observation is not sufficient so you can say which they do use?

A. No, sir, I think they use both. No, it has not been sufficient for me to give you a positive statement.

Q. It is true, is it not, that the better illuminants, other things being equal, tends constantly to supersede the poorer, beginning with candles and whale oil, lamps and gas and electricity, all the way down through?

A. Of course.

Q. And the earlier industries have been virtually driven out of business in some instances by the discovery of better illuminants?

A. Well, the uses have been diverted, as in the oil business; there is not as much oil used for lamps, but there is more oil used.

3398 Q. But unfortunately we cannot use gas except for the purpose of fuel and illumination.

A. Oh, no, but you were speaking of illumination.

Q. Have you any information about this Tunston lamp which it is claimed will produce 2½ times the illumination at the present price of electricity?

A. I have heard discussions on that but don't know much about it.

Q. If it should prove to be well founded, would that make a very serious inroad into the gas lighting that is left, if you could produce your electricity for illumination for 40 per cent. of its present cost?

A. Any reduction of price, in short tends to affect consumption as I have said.

Q. And you have to take into consideration such things, as in all possibilities of the future?

A. Yes, and it becomes all the more important to reduce the price of gas.

Q. The less we sell and the bigger the inroad of electricity the more the price ought to be reduced?

A. The lower you sell the better you compete with electricity.

Q. That depends whether we can sell at a profit or a reasonable return. You would not claim we could make more money if we sold gas at a price which netted us an insufficient return.

A. No, you have to have a return.

Q. Now did you in the case of Boston, in computing the average prices and receipts, include all the receipts of the Brookline Company, part of which were from electricity?

A. In what computation now do you refer to? Oh, yes, in that table?

Q. Yes. Did you exclude the receipts from electricity?

A. I intended to exclude them and I believe I did. I can say that I am positive that I did but I don't know that I have brought with me the way in which I made that table up.

3399 Q. I don't care how you made it up, if you will assure me that you eliminated them. I merely asked for information because I have not computed it myself.

A. The way I made the table was to take the sales of private consumers of each company of the six and multiply it into the average price as given by the State Gas Commission, and in that way I got my table.

Q. Let us look at Table 19 for a moment. At what page is that?

A. I think that is the table on page 3088. Table 19 begins at page 3088 and runs through 3091.

Q. This table to which you have referred shows reductions in the price of gas in each of the cities named, sometimes the reductions for two periods, that is Cambridge, 1904-5 in the first place and then 1897-8 in the second place; Charleston 1894-5, 1897-8 1901-2, showing the year before and the year following in each case?

A. Yes.

Q. And you have shown what you think is the result on what you say was an average reduction of 10.83 per cent. in the price of gas?

A. Yes.

Q. Do you think that the same result would follow as to profits if you reduced the price of gas 25 per cent. as is proposed in New York City, instead of only 10.83 per cent.

A. No, not to a greater degree. I did not claim that in my testimony.

Q. Now, you do not claim, do you, that if a man is burning forty dollars' worth of gas per year, that merely because the Company reduces the price of gas so that he gets more gas for forty dollars than he did originally, he will then proceed to buy fifty dollars' worth of gas per year merely because he feels pleasantly towards the Company.

A. No, but he is quite likely to buy more.

Q. But he will get more gas for the original forty dollars, will he not?

A. Yes, but he is likely to have larger gas bills.

3400 Q. And a greater part of the consumers are people who are apt to have an average gas bill for the same amount each year, aren't they?

A. I will modify that as to his paying a larger bill. That begins to occur after the price goes down so it begins to compete with coal. Prior to that the fact is that there are more consumers who begin to use gas.

Q. How low will you have to have the price of gas so it will be as cheap as anthracite coal at, say, $6 a ton? How low will it have to be sold?

A. It varies as to whether it has to be used for cooking or for a furnace. It would have to be much lower for a furnace to compete with coal than in cooking.

Q. Well, it would have to be sold, would it not, as low as 30 cents a thousand feet at least in order to produce as economical results in consumption as anthracite coal at $6 a ton?

A. In heating through the dead of winter, I should say so, but that would not be true for summer and fall and for cooking.

Q. How low do you think it would be reduced before it could compete with anthracite coal for that purpose?

A. Taking into account the greater convenience, you would find large quantities used at 80 cents.

Q. Eliminate the question of convenience for a moment, and let me know at what price, if you can, gas must be sold to be as economical in use as anthracite coal at $6 a ton?

A. That is rather difficult to state exactly, but the experience of the cities that have tried the reduction in price shows a larger use of gas for fuel purposes.

Q. Was not Mr. Cowdery's idea that it would have to be as low as 30 cents a thousand feet?

A. Not for use in cooking or for summer and spring and fall heating; if he said anything of that kind, it could only have been in reference to heating through the middle of the winter. They have developed an immense business in the use of gas for fuel purposes in Milwaukee at a price of 60 and 80 cents and there they are allowed to use soft coal, while in New York, as I understand it, soft coal is tabooed and therefore they have to use a more expensive coal. 3401

Q. They would not use soft coal in furnaces anyway, would they?

A. They do to some extent in the West.

Q. On page 23 of this Chicago pamphlet which I have borrowed from Mr. Burr I find he states that "Gas at $1.00 per thousand for lighting is the cheapest artificial light that we have the privilege of using to-day. Gas cannot be used for general heating purposes until it gets down to at least 50 cents a thousand. A small number of customers could be secured to use gas for heating at that price. It would not begin to be as cheap as anthracite coal until it gets down to about 30 cents a thousand. At 30 cents a thousand gas is about as cheap for the consumer as anthracite coal at $6.00 a ton. To produce this result it should be used with a hot water heating system. To be used in connection with a hot air furnace the price must be reduced to 20 cents in order to be equal to anthracite coal at $6.00 a ton." Have you any quarrel with that proposition of Mr. Cowdery?

A. He has put it a little too extremely. I have found that by using natural gas in my own house, where I have a bill of about $150 for natural gas for heating and lighting, artificial gas at 30 cents being equivalent to natural gas at 18 to 20 cents, that I have saved $50 a year. My bill has fallen $200 to $150.

Q. There are more heating elements in natural gas than in artificial?

A. Well, that has been my experience, which I have worked out quite carefully, which makes me believe that statement which you have just read is a little too extreme.

Q. But not very much, is it?

A. Yes, I should say 5 or 10 cents. But I was not talking 3402 about the general substitution of gas for coal for general heating the year round when I say that at 80 cents it would make great inroads on coal.

Q. If, of course, you deliver more gas to the consumer for the same money than you delivered originally, you must have a greater capital account in order to produce this additional gas that you deliver, must you not?

A. The capital account——

Q. Well, would you not?

A. Yes, but not proportionately.

Q. Don't say "but." You have been all over that once, and I am calling attention to certain points in your testimony.

A. If I say yes, then on some other case, if not here, some one else will bring it up——

The Master: We have no concern with that. You will oblige me very much if you will answer these questions directly.

Q. The fact is then that it would mean an increase of the capital account for the delivery of a greater quantity of gas, would it not—greater or less?

A. Not in all cases.

Q. So that even if the sales were sufficiently increased so that the net profit was the same, that profit would have to be applied to pay a return on a greater amount of capital?

A. Yes, in most cases, not in all.

Q. We will see about that. Taking this table No. 19 and the cities which you yourself have chosen, that is in Massachusetts where you remarked a few minutes ago the assets could not be padded as they were in other parts of the Union, you take Cambridge for the year 1894-5, that is the year before the first reduction, and 1896-7, which is the year after the first reduction, and you then take the year 1897-8, the year before the second reduction and the year 1899-1900, the year after the second reduction, and you show what 3403 the increase is in feet sold. Now, it would be a fair thing, would it not, in order to determine whether the assets increased with the sales, and in what proportion, to see how much the sales increased in per cent. from the year 1894-5 to the year 1899-1900, that is the earliest and latest years and compare that with the increase in assets of the Cambridge Company during the same period?

A. If one could determine the extent to which the assets were due to that increase, and to what extent they were a preparation for the future, in other words, if one could determine the condition at the beginning and end with reference to its sales, that would be a very good method.

Q. But a company always has to make some preparation for the future, has it not?

A. Yes, but——

Q. And is it not fair to assume that it had made as much preparation for the future in 1894-5 as it had in 1899-1900 relatively?

A. But it would be a pure guess as to any one company. If you could average a hundred it would be a fair average probably.

Q. Would it not be a fair thing to take all the companies you have recited here in Table 19 and find what the result was, applying that method to the entire lot?

A. It would be fairer than to take one company.

Q. Let us take those and see how we come out on your theory. You have not the eleventh report of the Massachusetts Gas Commission here. That is, 1894-5, have you?

A. No.

Q. Well, I have. If I am correct, by that report the assets in 1894-5 were $971,547.47.

A. Speaking of the Cambridge Company now?

Q. Yes. Is that right (handing book)?

A. Yes.

Q. And in 1899-1900, as appears by that report, were they not $1,075,204.54?

A. $1,075,204.54.

Q. Now the gas profits appear in the year 1894-5 to have been $107,344.24, don't they? 3404

A. That is right, $107,344.24.

Q. And in the year 1899-1900, they appear to be $103,241.65, don't they?

A. Yes.

Q. Or less than they were in 1894-5?

A. Yes.

Q. So that the gas assets in the year 1899-1900 were 1.11 times the assets of 1894-5?

A. The assets were about that increase, I should think.

Q. While the profits were only .96 as much as they were in 1894-5?

A. I should think that was about the ratio.

Q. You did not take these various companies and compute throughout, did you, to find out whether the same result obtained on the average through them all?

A. No, I did make——

Q. You don't know therefore, whether the assets increased much more rapidly than the profits?

A. I made a computation with reference to Boston and found that during a period which I studied, the assets did not increase as fast as the sales. And I have found that generally true of all companies.

Q. You did not make a computation covering these cities, Professor, to determine what proportion the increase in assets between the first and last years mentioned for each one of these companies bore to the increase of sales between the first and last year, did you?

A. No, I simply tried it on Boston during the period in which the price fell from $1.35 to $1.00.

Q. No, but you said it was not fair to take one city, but you would have to take a number of them.

A. That is the only one I took anyway.

Q. Because Boston was more nearly like New York than any other city in general conditions?

A. No, but it was an extreme fall of thirty-five cents in two years and I had the time to take that, so I stopped to do it. I was 3405 quite surprised at the result because there was a new company almost starting in then, the Brookline Company.

Q. You still subscribe to the statement that if you take a large number of companies the result obtained by them will be more satisfactory than taking one city?

A. Yes, but I consider the results in Massachusetts will be very difficult to obtain from any such statement as the Commission returned on assets.

Q. But it is the best information you have, and these Commission reports are the various reports from which you have taken much of the data you have stated here?

A. In order to conceal their profits they are applying to construction all the time the money that should be classed as profits.

Mr. Mathewson: I move to strike that out.

The Master: Strike it out.

Mr. Burr: I object and except.

Q. If the companies of Massachusetts did pad their assets, which I understand to be contrary to what you originally asserted here, by taking money and putting it into new construction and additional plants without so charging it, then the assets of these companies would be greater instead of less than they appear on the reports of the companies, would they not?

A. I don't understand exactly the question except to say that their assets are larger than their stock and bonds.

Q. Well, that is another proposition. I have not said anything about stocks and bonds, but I am talking about their assets.

A. That is their assets claimed in their report.

Q. I am directing the question to the point you raised, that an increase in the sales of gas would mean a very small or proportionately small increase in the assets of the company on the 3406 ground the main increase would be in meters, services and things of that kind.

A. It would not be a proportionate increase.

Q. It would not be a proportionate increase. You have spoken of the increase in the Consolidated Gas Company in sales from 1884 to 1905 being from 3,942,000,000 feet to 13,283,000,000 feet, and during that time the plant of the Consolidated Gas Company increased about $9,963,000, as you stated?

A. It increased that according to that exhibit.

Q. The statement is somewhat wrong, because the $196,000 is left out of that and no working capital is in there, and so forth. But taking your testimony, as you gave it on that point, don't you know that in 1884 the Consolidated plants acquired from the six constituent companies already had a capacity considerably in excess of their sales of gas at that time?

A. I believe they did.

Q. And you know, to-day, don't you, according to the evidence here, that the plants are being run to their full capacity and that they are still unable to make the gas that they sell?

A. Yes, but I don't know of any evidence as to the extent of the surplus capacity in 1884. There was an excess, but how much I don't know.

Mr. BURR: What plants are you speaking of, of the Consolidated Company, or of the subsidiary companies?

Mr. MATHEWSON: Either, if you please. I am speaking of them at the time the consolidation took place and they then became the Consolidated Gas Company.

Mr. BURR: You speak of to-day, do you mean the plants of the subsidiary companies?

Mr. MATHEWSON: No, I am speaking of the plants of the Consolidated Gas Company.

3407 Q. So that the increase of assets from 1884 down to 1905 would not be a fair estimate of the required increase of assets to produce the increased output of gas, would it?

A. I so stated, I think, that there should be some allowance made for that.

Q. You did not state how much allowance, and you have not been able to compute from any data before you, have you?

A. No.

Q. What do you mean exactly by the statement that if a company can stand a reduction of any given amount it can still stand a reduction of eight or ten cents more?

A. That is, if it can stand a reduction on the assumption that the sales will remain stationary, which is the point on which I meant to use the term. That is, if the Consolidated Gas Company, on the basis of the sales of 1905, could stand that reduction to, we will say, 85 cents, then there will be such an increase in sales that it would make as much on 80 cents in the future as it would have made on 85 cents in 1905.

Q. Now, I am going to call your attention to Table 19, which, for all these Massachusetts cities, showed that during this period when they had this large increase in output of gas and the prices were somewhat reduced, the net profits at the end of the period were almost exactly what they were at the beginning of the period?

A. That is the year after the change. They were about the same as the year before the change, a slight increase but not much.

Q. But you do not mean quite that, because some of these changes took place in 1894-5, and there is a second change in 1897-8.

A. No, but I took each one as a separate entity. I think I made a fair statement there.

Q. Assuming that the Consolidated Gas Company was able to afford a cut in its price of gas to, we will assume, 90 cents, and would then just show profit enough to make a return on its capital 3408 at a reasonable rate and subsequent to the cut it delivered more gas to the consumers or showed such an increase of gas that the net profits were the same, how could it afford a further cut, the net profits being just the same afterwards as they were before, in spite of the larger output of gas?

A. But that is not a right interpretation of that table?

Q. Well, but the table shows, does it not, that the year after these cuts net profits were practically the same, almost exactly the same as they were the year before the cut?

A. Yes, but the first one——

Q. We will apply that to the Consolidated Gas Company, and suppose they made a cut of 90 cents and the year after the cut was made they only showed the same profit that they showed the year before the cut was made; they got less for their gas but sold more and got the same profit, how does that prove they could make another cut of ten cents and be just as well off?

A. Now, we will see if I can illustrate it by concrete figures. The profit that was read from an exhibit this morning as having been made last year amounted to how many million dollars? There was a figure given there in an exhibit.

Q. $4,000,000 and over, Exhibit 96, 1/20th of $91,000,000 and a little over.

A. I have it here, $4,587,995.99. Now, suppose that a reduction of 10 cents would reduce those profits by a total output of 1905 multiplied into ten cents or approximately $1,300,000, that would leave $3,288,000 approximately as the assumed profits the year after the reduction, if the reduction of ten cents were made. Now, assume that $3,288,000 is reckoned as a sufficient return to allow a reasonable profit on the structural value of the plant properly interpreted, whatever that may mean; assume that for the moment.

3409 Then my statement was intended to be that as far as that table would tend to establish anything it would establish the fact after the reduction did take place to 90 cents——

Q. That is two years later?

A. Yes, the year after the reduction——

Mr. Burr: And supposing there was no increase in consumption?

The Witness: No. That table would tend to establish the fact that if the reduction were made, we will say, early in 1906, then in 1907 the profit would continue to be $4,587,996. But we have already assumed for the purposes of comparison that the company can stand a reduction to $3,288,000. Then if it can stand a reduction to $3,288,000, then it can stand a fall to 80 cents, the fall to 80 cents leaving the profit still at $3,288,000, because of the enormous increase in sales. But there is a fair statement to be made, that some increase in plant would be necessary, and I do not mean to deny that, but so far as any implication can be drawn, and I hold there can, then to that extent if a company can stand a reduction of a certain amount it can stand a considerably larger reduction.

Q. But when is this thing to end? Is the theory to continue until you get down to zero?

A. I stated in my direct-examination—I made some statement providing always that the profits continued to be above operating expenses and enough to allow—that assumed a reasonable margin on the structural value.

Q. Then the whole computation rests on the preliminary determination of what the structural value is and what a proper return on that is, does it not?

A. It starts with that and figures on then that if can can from that justify a reduction of a certain sum on the basis of last year's business, future business will justify your making a larger reduction.

3410 Q. And that will always be so down to what figure?

A. It is very difficult to say, but it would continue to a considerable extent.

Q. Let me ask you another question. If you make a reduction from one dollar to 90 cents, that cuts off only ten per cent. of your gross receipts, but it cuts off a very much larger percentage of your profits, does it not, because they are the difference between the cost of gas and one dollar?

(No reply.)

Q. In other words, if the gas cost 70 cents and is sold for one dollar, and you cut to 90 cents, you are cutting off 33⅓ per cent. of the profits, although you cut off only ten per cent. of the gross receipts of the company, that is clear, is it not?

A. I started out with the assumption that we can stand a cut in profit to $3,288,000.

Q. I understand.

A. So that it is independent of the question of what the price of gas would reduce it. We start with the question of how low the profits can be reduced, and having fixed that, we will fix sales at such a price as on the basis of the operating expenses of 1905, will reach this sum.

Q. And I am trying to reach the limit of your theory.

A. There are no definitely fixed or mathematical limits.

Q. Would not a reduction from 90 cents to 80 cents make a greater difference than from one dollar to 90 cents, the sales being necessarily greater on your theory?

A. A reduction from 90 cents to 80 cents would make a greater difference than a reduction from one dollar to 90 cents, you say, in the profits?

Q. Yes, the sales necessarily being greater under your theory, as we reduced the price?

A. I don't know that I have stated that the proportionate increase is a greater per cent. of reduction in price, which is apparently what is back of your question. I don't remember making any such statement.

3411 Q. But I say, would not a reduction from 90 cents to 80 cents make a greater difference in the profits than one from one dollar to 90 cents, the sales necessarily being greater under the reduced price, according to your theory?

A. I don't quite see how that would follow.

Q. You are aware, are you not, that the city of London, next to the City of New York, consumes per capita the most gas?

A. That has been this testimony in this case and I have no reason to doubt it.

Q. Don't you know that when a reduction was made in the price of gas in London a few years ago, and a very substantial reduction, that the increase in consumption was less than one per cent. per annum, based on the previous year's sales?

A. No, I know nothing whatever about that.

Q. And if that were so, considering the character of the London climate, that would be quite a strong piece of evidence, would it not, that after you had reached a very high per capita of sales the increase beyond that reduction of price would be moderate?

A. No, not necessarily unless it were confirmed by the experience of Sheffield, which has made still greater reductions and still further cities and companies; there might be special circumstances connected with the London reduction. I know nothing whatever about it.

Q. Now, in this Chicago pamphlet, and I will ask you to correct me if I do not quote properly, Mr. Cowdery says: "Increasing the output usually cheapens the cost of production. Among gas men it is usually assumed that in the case of manufacturing the cost was usually decreased in the works until it reached a million cubic feet daily capacity. The second million would not cost much less than the first. I doubt if one could distinguish between the cost of
3412 operating a plant of 20,000,000 capacity and the operation
of four plants of 5,000,000 capacity each. I think the cost per thousand would remain practically the same whether you manufactured 20,000,000 or 40,000,000 feet. This would be true in the case of either a coal or water gas plant." Considering Mr. Cowdery's experience, would you not be prepared to accept that as strong evidence of the fact which he states?

A. Certainly, it has a bearing on it and tends to—it is a point in the evidence, certainly.

Q. And I read further from the statement: "Increasing the number of consumers to each mile of mains does not materially cheapen the cost of gas. This is especially true after reaching a certain point. The difference in cost would not be sufficient to warrant a reduction in price." Now, I understand in spite of Mr. Cowdery's large practical experience that you, who have had no experience in operating a gas plant, differ substantially from that proposition, do you?

A. Yes, I do to this extent, that as between companies similarly situated, increased sales are not accompanied by corresponding increases in distribution expenses usually, and that can be established by the statistics of Massachusetts and Great Britain, so that I consider I am as competent to study those facts as an engineer would be.

Q. Yes, but you misconstrue Mr. Cowdery a little, because he says that increasing the number of consumers to each mile of mains does not materially cheapen the cost of gas. That is to say, he refers to the cost of gas at the burners, and takes into consideration the additional plant required to produce the gas as well as any additional distribution expense?

A. But he has stated that the manufacturing expense does not change. If that does not change and if the total does not
3413 change according to his testimony, then there could be no change in the distribution expense, but I have found in my study of the statistics on the subject that there is a change in the distribution expense. There is a tendency to reduction.

Q. But we saw the other day, did we not, that the City of Boston, which had a very much greater distribution that the seven next largest cities in Massachusetts had a distributing expense of 18.76 cents, while those seven cities next averaged only 17.03?

A. I would say we did.

Q. And we found also on that basis that the cost of distribution in New York, 16.94, for the nominal year as you figured it, taking the same items for comparison, was less than either Boston or the seven next largest cities in Massachusetts, did we not?

A. That it was less than the seven next to Boston. I think it was less than Boston.

Q. Yes, nearly two cents.

A. According to that table.

Q. And a little less than 16.94 as against 17.03 when compared with the seven next largest cities named?

A. Yes.

Q. I would like to ask you one question in reference to your hypothetical figures on New York. The profits of the company for the year 1905 appear in Exhibit 96 to be $4,987,995.99. That at ninety cents which you figured with would mean a reduction of $1,300,000?

A. I am not sure about that. I took that for an assumption for the amount. But I afterwards modified that and said I was—I am not sure about that at all, but I said that if the profits would stand—if a price were finally fixed which would cut off $1,300,000 of profits so as to leave the profits $3,288,000, then a still lower price would still leave those profits.

3414 Q. Now, assuming that we were to reduce the gas to 90 cents, that would cut off $1,300,000 from the net profits, would it not?

A. I do not say that now. I should want to take that off from the gross receipts.

Q. Well, on the same sales of gas, assuming the profits to be as stated, $4,587,000 at one dollar, and the price of gas was reduced to 90 cents, it would mean a loss from that source of about $1,300,000, or ten cents per thousand feet, would it not?

A. It would seem so, but I would not—I am not so absolutely positive——

Q. It would on that number of cubic feet, would it not?

A. It looks so now to me on that number of cubic feet.

Q. How much more gas would the company have to sell to make up that $1,300,000, provided gas was costing it 65 cents at the burners?

A. Then the profit on that basis——

Q. In other words, how many thousand feet would it have to sell to bring its net profit back to the original figure?

A. The difference between sixty-five and ninety or twenty-five cents would seem at first the proper margin, but it would not be because taxes would probably not increase proportionately. Certainly distribution expenses would not.

Q. I don't know why you think that, because taxes have been increasing every year.

A. If the profits were declining there would not be an increase in taxes from that source. It may be taxes will increase for other reasons but distribution expense would decline with increase in sales. That is, per thousand feet. But I will take your supposition in the way you give it without assenting to the basis for it and figure out what number of feet at twenty-five cents a thousand feet profit would be necessary to make a profit of $1,300,000, which I understand would be four times as many thousand feet as there are dollars, or 5,200,000,000 feet.

3415 Q. In other words, it would require an increase of 5,200,000,000 feet over the present sales of 13,283,000,000 feet or forty per cent., in order to make up to us that $1,300,000 which we lost by reducing the price of gas to eighty cents, would it not?

A. On those two suppositions. The gas costs you 65 cents now and that there would be any reduction per thousand feet with the additional sales.

Q. And that is without taking into account the additional plant that might be required to produce this additional gas and the consequent requirement for a larger return on capital?

A. Unless the capital was to increase faster than the sales of gas that suggestion of yours would not apply.

Q. But we are simply getting at here the amount of the net profits before any application is made of capital at all.

A. No. You have assumed there was a twenty-five cents margin for profits per thousand feet.

Q. Yes, precisely.

A. No, your last suggestion that there would be less than twenty-five cents profits because of necessary increase of capital would not hold.

Q. Wait a minute. I haven't made any such suggestion as that at all. I mean by profits the difference between the cost of gas at the burner, with proper allowance for reserve fund and so forth included, if any should be, and the selling price of the gas, nothing for return on capital coming out of that at all as yet. And would it not be true, as I said, that this result which you have just testified to would be without taking into account the fact that we would require a larger plant to produce the gas and a greater requirement for the return on capital to come out of the net profits?

A. That would apply to the 5,200,000,000 feet. It would not apply to the twenty-five cents margin.

3416 By Mr. Burr:

Q. Why not?

A. Because the twenty-five cents margin would still continue unless the property was to increase faster than the sales.

By Mr. Mathewson:

Q. Yes, but the point is this, having sales of 13,283,000,000 feet and having cut $1,200,000 off our net profits, as shown in Exhibit 96, by reducing gas to ninety cents, in order to get our net profits back where they were originally, as shown in Exhibit 96, we would have to use, if gas costs say sixty-five cents at the burner, 5,200,000,000 cubic feet more than the present 13,283,000,000 cubic feet in order to restore the profits to what they were originally?

A. On the suppositions you give I should say yes.

Q. And that would be without taking into consideration at all the increased value of plant and the requirement for a larger amount to pay a return on the increased plant?

A. Yes.

Q. Now there is one thing which I think you have left out of consideration in this case. Most of the cities which you have been considering have been cities which have suburban sections which have been growing up, growing quite rapidly, and where there is a chance for further growth within the territory of the company which you were considering, were they not?

A. They have been situated that way principally.

Q. Now in the Island of Manhattan you understand that it is surrounded by water and that this company has no right to sell gas outside of the Island of Manhattan? And you understand do you not, that there are no suburbs to which the company can deliver its gas, so it will not benefit by the growth of the Borough of The Bronx or Queens or Brooklyn?

A. I understand that.

3417 Q. And would you expect the same percentage of increase to take place under those circumstances as takes place in a city with large suburbs which are constantly growing. Isn't that a serious thing to be considered?

A. I allowed for that by looking into the increase in population. It seems to me that the census establishes the fact that the growth has continued on the Island and will for the next five years represent a rate that it has averaged for the last twenty years.

Q. Don't you know that the Borough of The Bronx is increasing in population very much more rapidly than Manhattan Borough?

A. Yes.

Q. And that the sales of gas are increasing very much more rapidly there than in the Borough of Manhattan?

A. That is true.

Q. And don't you know that some portions of the Borough of Manhattan which formerly were residence districts have grown up to be business districts and that their population is constantly decreasing?

A. Yes, but I believe the Borough of Manhattan has increased as fast and is likely to for the next ten years as the Massachusetts cities I took, although I have not looked that up, but I know New York has been increasing very fast, faster than the average American city.

Q. Do you refer to the Borough of Manhattan when you say New York?

A. The Borough of Manhattan has been increasing fast too.

Q. You know a commission on additional water supply for the City of New York was appointed some time ago consisting of engineers, Messrs. Burr, Herring & Freeman, do you not?

A. Yes.

Q. Will you look at page 67 of the report of that committee and say what that committee estimates the population of Manhattan to be in 1925?

3418 Mr. BURR: That is objected to as incompetent, immaterial and irrelevant; the Commissioners are not here so that we may cross-examine them and find out the reason for their deduction as to the population of that year to which you refer. You called Professor Marks' attention to that.

Mr. MATHEWSON: I am going to call Professor Bemis' attention to it also and ask what effect that has upon his opinion of the increase of population, or something of that sort.

Mr. BURR: For the purpose of that report, in special instances, they may have found that that would be the population, but that is not binding on us.

Mr. MATHEWSON: They may have made a mistake.

The WITNESS: I am not looking as far ahead as 1925.

Q. What do you find the population to be according to that estimate?

A. 2,130,000.

Q. That population is only equal to the population at the present time as given by Dr. Marks, and if the estimate of this Commission was to be accepted as an authority it would show, would it not, that an estimate of a very great increase in Manhattan within the next five or ten years was subject to question?

A. So far as that is concerned it would have that bearing but I think I have seen census figures indicating an increase of considerable in the last five years.

Q. You haven't seen census figures up to 1925?

A. No; 1905 as compared with 1900.

Q. Speaking of conditions under which we operated, do you know any city east of Ohio, with the exception of this eight--five-cent rate in Boston, which is selling gas at less than ninety cents per thousand cubic feet?

A. I do not.

3419 Q. And do you know of any cities outside of Massachusetts which are selling even for ninety cents?

A. East of Ohio?

Q. Yes.

A. No.

Q. And the Massachusetts candle-power as you stated the other day is 16 as against our 22, so that there must be some allowance made in making comparisons for that difference, must there not?

A. That is one of the points for which some allowance must be made.

Mr. Burr: The evidence is that gas is made here and produced under the most favorable conditions that exist in this country.

Mr. Mathewson: That is the testimony of Professor Marks.

Mr. Burr: No, I think Mr. Bradley assented to that.

Mr. Mathewson: Well, the evidence shows.

Q. Now, Mr. Shearn, whom you say retained you for appearance before the Gas Commission, did not personally conduct that case, did he, on behalf of the complainant?

Mr. Burr: Objected to. I do not see what Mr. Shearn or Mr. Hearst or anybody else has to do with this case.

Mr. Mathewson: I will develop it in a moment so that you will see what it is.

Mr. Burr: Well, what is the object, Mr. Master?

The Master: Well, I do not know.

Mr. Burr: If we are going into that I think we should be informed ahead of time what is the object of Mr. Mathewson's question.

The Master: There is no objection to the preliminary question.

Mr. Burr: Well, what is the object of it?

3420 Mr. Mathewson: It will appear in a moment.

Mr. Burr: Shall I be obliged to call Mr. Shearn here and Mr. Hearst?

Mr. Mathewson: No, I don't think so. I don't think it will be disputed.

Q. Who was Mr. Shearn's associate or representative who conducted the case before the Gas Commission for the complainant, at which Mr. Shearn appeared as attorney of record?

A. Mr. Ford.

Q. Mr. De Ford?

A. Mr. De Ford.

Q. And it was he with whom you had your conferences and he who examined you before the Commission?

A. Yes.

Q. And he you would say was a young man of ability and discernment, wouldn't you?

Mr. Burr: Objected to. We are not giving a certificate of character to either Mr. Shearn, Mr. Hearst or Mr. De Ford in this case. I do see its pertinency.

The Master: I do not think that is of any great importance.

Mr. Burr: Maybe I would admit it if you will tell me what you want to prove.

Mr. Mathewson: What is the ruling?

The Master: I have no objection to your going on only I do not see how it is material.

Mr. Mathewson: I have only one or two questions on this point. I think my purpose will appear in a minute.

The Master: What is the object of it, as to whether Mr. De Ford was an able man or otherwise?

Mr. Mathewson: If the Master rules the question out I shall accept that ruling, of course.

The Master: I will rule it out then.

3421 Mr. Mathewson: I won't press it.

Q. Mr. De Ford, you know, was the representative before the Gas Commission of Mr. Shearn from beginning to end.

Objected to as incompetent, immaterial and irrelevant, not bearing on this question at all.

Question allowed; exception.

A. Yes, I so understood.

By Mr. Burr:

Q. You have no doubt that Mr. De Ford did his full duty at that investigation?

A. No.

Mr. Burr: If that is what you are trying to prove, I will admit that.

By Mr. Mathewson:

Q. Now, I show you the minutes of a hearing before the Senate Finance Committee at the capitol at Albany, New York, February 16, 1906, which was subsequent to the conclusion of the testimony before the Gas Commission where Mr. De Ford appeared in favor of the eighty cent gas act which had been passed and which is here the subject of attack. If you have any question about it, Mr. Burr, I will present to you the volume.

Mr. Burr: Does this purport to show what Professor Bemis said on that occasion, or does it purport to show what Mr. De Ford said on that occasion?

Mr. Mathewson: It does not purport to show what Professor Bemis said on that occasion, because Professor Bemis was not there.

Mr. Burr: If it purports to show what anybody else said

3422 on that occasion, I object to it as incompetent, immaterial and irrelevant.

Mr. Mathewson: I propose to read here very briefly what Mr. De Ford said upon the subject of the economical management of this company and then ask Professor Bemis in view of his testimony and the expressions of Mr. De Ford at that time whether he is not prepared to modify his expressions as to possible extravagant management of this company?

Mr. Burr: If that is admitted I propose to show what political economists have said as to the management of gas companies all over the United States.

The Master: Not before me.

Mr. Burr: I insist upon my objection. This certainly is incompetent, immaterial, and irrelevant. Though I have the highest regard for Mr. De Ford and I am fully assured he did his full duty before that Commission, at the same time what he said in the capitol at Albany on a given occasion after the meeting of the Commission terminated, certainly we would not be bound by, and I don't know what it is.

The Master: I think that is stretching the thing pretty far, Mr. Mathewson: It might very well be proper cross-examination to take some well known text-writer or expert and quote his views and ask if they modified the Professor's opinion, but when it comes to getting down to the question of individual counsel and individual investigation, I think that is going pretty far.

Mr. Burr: I have Mr. Mathewson's brief here which I would like to read to you which he presented to the Governor, contradicting some of the assumptions he has assumed in this case.

3423 The Master: I will sustain the objection and you can have an exception.

The Witness: I would like to assert that I would not like to be interpreted as saying that I had any direct knowledge as to who paid Mr. Shearn's bills or Mr. De Ford's. I never knew anything about it.

Mr. Mathewson: Oh, no, of course not. Now I will read from these proceedings before the Committee as follows:

"Senator Cassidy: In a spirit of temperate discussion, have you examined into this company's affairs so that you know whether they are economical?

"Mr. De Ford: The only knowledge I have got is what I have received by two months association with Mr. Mathewson and Senator Page and the Commission. But I would say that it appears to me, so far as I can tell, that they are economically managed. That is to say, that all depends; I want to qualify that in this way. They handle their cartage, which is a saving of money to them. They save cartage through the instrumentality of the National Coke & Coal Company. But whether those items are true or not, I don't know. I wouldn't be satisfied with it if this was litigation; for if I could spend the next two years in going through their books I wouldn't be satisfied with the statement.

"Senator Cassidy: Are they doing eevrything possible to realize the largest profit from their concern? Have they got a capital account?

"Mr. De Ford: I couldn't tell that. I know that they are very smart men. They are watching every corner where they can save a penny.

3424 "Senator Cassidy: Employ the most skilled help?

"Mr. De Ford: Everything that affects the reduction of their cost.

"Senator Cassidy: So as to get large profits?

"Mr. De Ford: So as to get and keep large profits.

"Senator Cassidy: You don't think there is any concern——

"Mr. De Ford: I think they are trying to make all the money they can and manufacture gas as cheaply as they can."

In the two lines which I read as follows: "Mr. De Ford: Everything that affects the reduction of their cost," in the typewritten copy of the minutes of this debate received from the stenographer, the word "cost" appears as "property," I have changed the latter word in lead pencil to read "cost." Now have I correctly quoted all I have read, or are you willing to accept my reading as accurate?

A. I know nothing about it except I heard you read it.

Q. I am quite willing you should look at it if you have any doubt about my having read it inaccurately.

A. I think it had better go in as your testimony and not mine.

Mr. Burr: We have no doubt you read it correctly.

The Witness: If you state you have read it correctly, I have no reason to think you did not.

Q. Now, assuming that as the statement of Mr. De Ford who was present, as you have said, before the Commission from the beginning to the end, and who was the associate of Mr. Shearn and who examined you, have you any doubt that the company was economically managed, as Mr. De Ford states was his conviction.

3425 & 3426 A. I can only judge by the evidence.

Q. You still, from what I have read and in spite of Mr. De Ford's view, maintain the position which you stated at the outset, do you?

A. I do. I do not mean to say that on re-direct examination I shall not take occasion to slightly modify one or two tables, but I mean to say in general my position remains.

Mr. Mathewson: I have no more questions.

Mr. Burr: Have you finished now your cross-examination?

Mr. Mathewson: I have.

Following a colloquy between counsel and the Master the re-direct examination of Professor Bemis goes over till Monday, October 29th, 1906.

At 4.15 p. m. adjourned to October 26, 1906, at 12 o'clock.

Last Exhibits:

Complainant's, 156.
State's, W,
City's, 59.

3427 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, FRIDAY, *October* 26, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Mead, Mr. Burr.

3428 JOHN M. THOMPSON, recalled on behalf of the City, testifies as follows:

Direct examination by Mr. BURR:

Q. Have you appraised the property of the Consolidated Gas Company on the west side, as it was prior to the acquirement by the City of New York?

Mr. MATHEWSON: You mean the real estate?
Mr. BURR: I mean the real estate and land.

A. Yes.
Q. Will you describe that property?
A. The first is Block 688, being the entire block bounded by 16th and 17th Streets, Tenth and Eleventh Avenues.
The next is Block 689, being the entire block bounded by 17th and 18th Streets, Tenth and Eleventh Avenues.
The next is Block 690, fronting 184 feet on Tenth Avenue, twelve lots on the southerly side of 19th Street, and seventeen lots, or 425 feet, on the northerly side of 18th Street.
The next is Block 691, fronting 184 feet on Eleventh Avenue; ten lots, or 350 feet, on each street.
The next is Block 666, lot 3, which is an irregular plot, bounded by 16th and 17th Streets, Eleventh and Thirteenth Avenues.
The next is Block 666, lot 12, an irregular block, bounded by 17th and 18th Streets, Eleventh and Thirteenth Avenues.
Q. Is this the same property that was appraised by Mr. Wheelock and Mr. Preiss?
A. Yes, sir.
Q. Now, will you take them up in their regular order and state what in your opinion was the value of each parcel?
A.—
Block 688, $639,860.00.

Block 689, $639,860.00.
3429 Block 690, $363,600.00.
Block 691, $285,460.00.

Block 666, lot 3, $74,280.80.

Block 666, lot 12, $119,834.19.

And there is another thing I should have given—a bulkhead between 17th and 18th Streets, $94,375.00.

Bulkhead between 16th and 17th Streets, $94,375.00.

Cross-examination by Mr. MATHEWSON:

Q. Are these figures which you have given for the first four blocks, 688, 689, 690 and 691, figures for the entire blocks before deduction was made for the 18th Street improvement, or is it merely the valuation you placed upon that portion of those blocks that was taken by the City?

A. Why, no, sir. It embraces the entire blocks 688 and 689, which were owned by the gas company, and the entire portion of 690 which was owned by the gas company, and the entire portion of 691 which was owned by the gas company; all before the city acquired any of it.

Q. In other words, that is the valuation of those blocks, or of that portion of those blocks that the gas company owned before the improvement?

A. Yes.

Q. And not the valuation of merely the part that was taken by the city?

A. No, sir.

Q. And did you use the same unit values in reaching these totals for those four blocks that you used in computing the value of the portions still left to the company, in your original testimony?

A. I did not.

Q. What variation did you make, and why, in these blocks, from your original figures?

A. I could not tell you the exact figures, for I haven't the papers with me; but I put a less value on this property prior to its
3430 acquirement by the City of New York. I gave a greater value to that which remained for the reason that the property had been very much improved by the new marginal street, new piers, new steamship companies going there.

Q. You mean you put a higher value in your original testimony on the part that was left to the company and a proportionate value as it existed before the improvement?

A. Yes.

~~Q. So~~ that these figures here represent a lower value relatively than you gave in your original testimony for the property still left to the company?

A. Yes, sir; somewhat lower.

Q. Will you give me the basis of valuation that you now employ in reaching these totals for each of these blocks?

A. Northeast corner of Eleventh Avenue and 16th Street, 2,500 square feet at the rate of $19,000 per lot, or $7.60 per square foot, $19,000.

Lot adjoining corner, 2,500 square feet, at the rate of $12,500 per lot, or $5.00 per foot, $12,500.

Four inside lots, 8,400 square feet, at the rate of $11,500 per lot, or $4.60 per square foot, $38,460.

Lot adjoi-ing the corner of 17th Street, 2,500 square feet, at the rate of $12,500 per lot, or $5.00 per square foot, $12,500.

Southeast corner of Eleventh Avenue and 17th Street, 2,500 square feet, at the rate of $19,000 per lot or $7.60 per square foot, $19,000.

Forty-eight lots on 16th and 17th Streets, 2,300 square feet each, or 110,400 square feet, at the rate of $4 per square foot, or $10,000 per lot, $441,600.

Two corner lots on Tenth Avenue, 2,500 square feet each, at the rate of $16,500 per lot, or $6.60 per square foot, $33,000.

Two lots adjoining corners, 2,500 square feet, $13,000 per lot, or $5.20 per square foot, $26,000.

3431 Four inside lots, 2,100 square feet each, 8,400 square feet, at the rate of $4.50 per square foot, $37,800.

Total, $639,860.

Block 689, I arrived at the valuation there in exactly the same way, the blocks being identical.

Block 690, two corner lots on Tenth Avenue, 2,500 square feet each, at the rate of $16,500 per lot, or $6.60 per square foot, $33,000.

Two lots adjoining corners, 2,500 square feet, at the rate of $13,000 per lot, or $5.20 per square foot, $26,000.

Four inside lots, 2,100 square feet each, 8,400 square feet, at the rate of $4.50 per square foot, $37,800.

Seventeen lots on 18th Street, 2,300 square feet, each, 39,100 square feet, at the rate of $4 per square foot, $156,400.

Twelve lots on 19th Street, 2,300 square feet each, 27,600 square feet, or $4 per square foot, $110,400.

Total, $363,600.

Block 691, northeast corner of Eleventh Avenue and 19th Street, 2,500 square feet, at $19,000 per lot, or $7.60 per square foot, $19,000.

Lot adjoining the corner, 2,500 square feet, at the rate of $12,500 per lot, or $5 per square foot, $12,500.

Four inside lots, 8,400 square feet, at the rate of $11,500 per lot, $4.60 per square foot, $38,460.

Lot adjoining corner of 20th Street, 2,500 square feet, at the rate of $12,500 per lot, or $5 per square foot, $12,500.

Southeast corner of Eleventh Avenue and 20th Street, 2,500 square feet, at the rate of $19,000 per lot, or $7.60 per square foot, $19,000.

Twenty lots on 19th and 20th Streets, 2,300 square feet each, 46,000 square feet, at the rate of $4 per square foot, or $10,000 per lot, $184,000.

Total, $285,460.

3432 Block 666, Lot No. 3, containing 8,441 square feet, at the rate of $22,000 per lot, or $8.80 per square foot, $74,280.80.

Block 666, Lot 12, 2,076.39 square feet, at the rate of $22,000 a lot, or $8.80 per square foot, $18,272.23.

The next lot north, 2,219.37 square feet, at the rate of $14,500 per lot, or $5.80 per square foot, $12,872.35.

Four adjoining lots, 8,504.44 square feet, at the rate of $13,500 per lot, or $5.40 per square foot, $45,923.98.

Lot adjoining the corner of 18th Street, 2,842.87 square feet, at the rate of $14,500 per lot, or $5.80 per square foot, $16,488.65.

Plot on south side of 18th Street, 2,986.02 square feet at the rate of $22,000 per lot, or $8.80 per square foot, $26,276.98.

Total, $119,834.19.

Bulkhead between 16th and 17th Streets, 188.75 lineal feet, at $500 per foot, $94,375.

Bulkhead between 17th and 18th Streets, 188.75 lineal feet, at $500 per foot, $94,375.

By Mr. Burr:

Q. I allow you notice $500 for the bulkhead property that you speak of, and you only allowed $250 at 42d Street. What is the reason for the difference?

A. Well, the city acquired a great deal of that property down at $500 a foot. I don't believe those bulkheads should be made to pay on that basis, but I have allowed the value very largely on account of the increase of traffic that has taken place there, around from 18th to 23d Streets, such as the establishment of the Delaware, Lackawanna and Western Railroad ferry, the building of the new Erie ferry house, the Central Railroad, and things of that kind 3433 that have added very largely to the values down in that neighborhood.

By Mr. Mathewson:

Q. Do I understand it is questioned whether $900 per foot has been awarded at 22d Street?

A. I think so, yes, sir.

Q. You think it has been awarded?

A. I think it has not been.

Q. If it had been, or if it should be, would that modify your view of values at this point?

A. No, sir, because it cannot be made to pay on that basis.

Q. In your opinion?

A. Backed by the Dock Department rentals, sir.

Martin McHale, recalled for further examination, testified as follows:

By Mr. Burr:

Q. You have heard the testimony of Mr. Thompson in regard to the property that he has appraised?

A. I did.

Q. Did you appraise the same property?

A. I did.

Q. Will you describe it and give your valuation?

Mr. Mathewson: Is there any use of describing it over again?

Mr. Burr: Not if you do not want it.

Mr. Mathewson: I do not.

The WITNESS: Our figures are precisely the same. We examined it together and came to the same conclusion.

3434 By Mr. MATHEWSON:

Q. Did you reach them on the same basis of computation as to individual lots?

A. On the same basis of computation as to individual lots yes, sir.

Mr. MATHEWSON: I have no further questions.

Mr. BURR: That is all I have.

The MASTER: Call the next witness.

Mr. BURR: I will have Mr. Lacombe here after recess.

Recess until 2 p. m.

After Recess.

CHARLES F. LACOMBE, called as a witness in behalf of the defendant, the City of New York, being duly sworn, testified as follows:

Direct-examination by Mr. BURR:

Q. What is your occupation?

A. I am an engineer of light and power for the city of New York.

Q. How long have you occupied that position?

A. Very close to a year.

Q. And what were you before that?

A. I was engineer of surface construction for two years.

Q. For the City of New York?

A. Yes, sir.

Q. Has your attention been called to the item on Exhibit 94 in this case, of street lamps?

A. Yes, sir.

Q. Is it part of your duty as chief engineer or engineer to look after the lamps of the city?

A. Yes, sir.

Q. Are you familiar with the situation as it existed during 1905 with regard to street lamps between the City of New York and the Consolidated Gas Company?

A. Yes, sir.

3435 Q. Did the Consolidated Gas Company have a contract with the City of New York during 1905?

A. Part of it, up to Mach 16th, 1905.

Mr. MATHEWSON: You refer to a written contract when you say a contract.

The WITNESS: Yes, sir.

Q. Have you that contract with you?

A. No, sir, you told me you had a copy here.

Q. Well, it is in evidence here. Was there a written contract for the balance of 1905?

A. No, sir.

Q. What part of the year was the contract for?

A. The contract was from January 1st to March 15th.

Q. And do you know the reason why there was not a contract for the rest of the year?

Mr. Mathewson: Is that important? I object to it unless the materiality is shown.

Q. I will ask you whether as a matter of fact the bids that were made by the Consolidated Gas Company were not rejected?
A. Yes, all the bids were rejected.
Q. And what was the contract for, that you have referred to?
A. It was for furnishing and erecting and lighting and cleaning and extinguishing of mantle gas lamps and the supply of gas to them, including the repairs and maintenance of the lamps and was for the supply of gas to public buildings.
Q. And to the lamps?
A. Yes, and to the lamps, and for the repair of lamp posts according to a schedule.

By Mr. Mathewson:

Q. Was it not in the same form practically as the bids or request for bids of the previous years? 3436
A. Practically, yes.
Mr. Mathewson: I think that form is in evidence, is it not?
Mr. Burr: I think so.

By Mr. Burr:

Q. Was the service for public buildings and street lamps continued during the rest of 1905 after the contract had expired?
A. Yes, it was fully performed so far as we knew throughout the whole year.
Q. Did the Consolidated Gas Company render bills for this service?
A. Yes.
Q. Have you the bills?
A. Yes, these are the bills, by months.
Q. Will you take one of them and state what that bill embraces?
A. This embraces the street lighting for the month of January in the Borough of Manhattan and includes all the lamps in the Borough of Manhattan and the proper contract performance that had to be gone through with these lamps, and they billed them, and in addition they billed the various changes that occurred during the month; a certain number of the lamps billed here are open flame lamps and the large majority mantle lamps, and they are billed at the same rate as specified in the contract period. This was during the contract period.
Q. How many lights are there that the Consolidated Gas Company supplies?
A. According to this bill, 16,236 mantle lamps and 746 open-flame lamps.

By Mr. Mathewson:

Q. Were not those open-flame lights the street corner lamps, the sign lamps, as they are called? 3437

A. At that time they were, yes.

By Mr. Burr:

Q. Have you made an analysis of those bills?

A. Yes.

Q. Will you produce it?

A. Yes.

Mr. Mathewson: What bills? He has only referred to a certain bill. Do you mean has he made an an-lysis of each one separately?

Q. Of what bills did you make such an analysis?

A. I have taken each month for the year 1905 and made the analysis complete, both for the Borough of Manhattan and The Bronx, but they are presented separately in this analysis clear through the year.

Q. This analysis which you produced, marked Schedule I, is an analysis of the bills rendered by the Consolidated Gas Company for the year 1905?

A. Yes.

Q. What does that show?

A. That shows in the first column the charge per month for lighting, cleaning, extinguishing and taking care of lamps complete. In the second column it shows the repairs to lamp posts, complete. The third column shows the total of those two amounts. The fourth column shows an item we call "Miscellaneous Lighting," which consists of the lighting of four or five special lamps. In the fifth column are the bills for lighting, care and attendance of open-flame gas lamps. In the sixth column the care and attention and supply of gas to sign lamps, which were discontinued at the end of the third month, and also an item of repairs to lamp posts for street sign lamps. The last column shows the bills for lighting, care and so on, of single Welsbach lanterns in The Bronx.

3438 Q. Will you give the result of that analysis and totals as you figured them out?

A. This analysis checks exactly the bills of the Consolidated Gas Company and shows that the total bill for the Borough of Manhattan was $431,624.95.

Mr. Mathewson: For the calendar year?

The Witness: Yes, sir. In The Bronx it was $143,758.90, and the total bill of the Consolidated Gas Company for Manhattan and The Bronx was $575,383.85.

Q. What other analysis have you made of the bills?

A. Well Schedule I-a is an analysis giving the repairs of lamp posts in the Borough of Manhattan. There were none in the Borough of The Bronx for the year.

By Mr. Mathewson:

Q. Let me ask at this point, if I may, do these items of repairs and all these other items on this analysis or these various schedules appear in the bills presented by the Consolidated Gas Company?

A. Yes.

Q. These are figures merely analyzing the figures which appear in the bills to which you referred at the outset?

A. Not so much analyzing them, but classifying them.

The MASTER: Grouping the various items?

The WITNESS: Yes.

Q. In other words, these are figure- of the company as classified and your own statement?

A. Yes. You see that second sheet is really the separation and classification of column 2 on the first sheet.

3439 By Mr. BURR:

Q. Will you continue your explanation of Exhibit 1-A?

A. That shows by columns the kind of repairs which the city ordered and which the Consolidated Gas Company performed and which were billed at the scheduled rates given in the contract, and that checked with the total as given on the first page, showing the total bill for repairs to lamp posts for the year was $10,986.50.

Q. You might proceed with the rest of those tables which you have prepared.

A. The rest of these tables, Mr. Burr, are only important in that we made them up in order to be dead certain that we could check the Consolidated Gas Company's bills. The slight differences that occur here are simply because we take it on the basis of actual days and turn those into actual lamp hours. The Consolidated Gas Company in billing single Welsbachs, for instance, charges at the annual rate of $24.75. They charge at a monthly rate of $2.06. Now, $2.06 is not a twelfth of $24.75, and on that basis the Consolidated Gas Company is really undercharging. In open-flame gas lamps, which is the result of the next sheet, they make that up practically by overcharging a little the open-flame lamps at the annual rate of $17.25, or a monthly rate of $1.44. That is a little too much, a little more than one-twelfth. They practically balance, so the difference is not of any account. The reason we differed at all from you is because we take the actual thing carried out to a fraction and take the actual number of days and hours.

By Mr. MATHEWSON:

Q. But there is not any difference that is substantial?

A. No, we only did it to be exhaustive, that is all, and 3440 that applies to Schedule 3-A, 3-B, 3-C and Schedule 3-D. There is one cent deficit. We tried to get as close as we could and Schedule 3-E is The Bronx, which is analyzed the same way. That brings us to schedule IV, which begins to get the analysis of the thing.

Q. What does schedule IV show?

A. Schedule IV shows our computation of their bills by getting them into the actual number of lamp days, that is, the number of days that one lamp would have had to burn to make this bill.

Q. In other words, it is an analysis of the gas consumption?

A. Then we turned that into lamp hours for the year. That was represented by the second column. Now, according to the contract, the minimum amount of gas that any of these lamps should take was three cubic feet. They took that and took more, probably.

Mr. MATHEWSON: When you say "they," you mean the city, the lamps?

The WITNESS: Yes. We calculated them on practically four different bases, in order to try and exhaust the subject. The first column gives the number of cubic feet of gas if the consumption is maintained at three cubic feet per hour. The next one gives it at three and a half cubic feet per hour. Then I understood from the testimony that Mr. Addicks had testified that in his opinion he thought the mantle lamps consumed 3.77 cubic feet of gas per hour, and the open-flame 4½ per hour, so we calculated what the consumption of gas would be if sold as well.

Q. And what is the result?

A. Well, of course, there are four results. The single Welsbach
lamp at 3 cubic feet per hour, they would take 195,374,865
3441 cubic feet of gas, at 3½, 227,937,342; at 3.77 feet, 245,521,-
080, and at 4½ feet, the open-flame lamps would take
9,923,566.

Q. What is this total?

A. Making a total on Mr. Addicks' basis of 3.77 feet for mantle lamps and 4½ feet for open-flame lamps, 255,622,213 feet in the Borough of Manhattan, and in the Borough of The Bronx on the same basis they would have taken 85,945,304, making the total consumption for street lamps in Manhattan and The Bronx of 341,567,517. Schedule V represents the way of getting all these various rates of gas consumption into dollars. According to that, at 3 cubic feet, the number of feet used is given, and then the amount. The same way with 3½ cubic feet, and then on the basis of 3.77 feet and 4½ feet. And The Bronx is given in the same way.

Q. On the basis of the 3.77 cubic feet, what does that show?

A. It would show the total single Welsbach lamps would cost $220,968.97 for gas, figuring at 90 cents per thousand cubic feet, and miscellaneous mantle lighting would add to that $159.81. The open-flame gaslight would add to that $8,931.20 in the Borough of Manhattan.

Q. And on the basis of 3 cubic feet?

A. $175,837.38, plus $4,752.88, plus $1,201.26, plus $127.17. The same way at 3½ cubic feet would be the sum of $205,143.61 and $5,545.02.

Q. For open-flame?

A. Yes. These figures are both for open-flame and mantles. They are practically arbitrary figures. We did not split them, but averaged them. And $1,401.47 and $148.37, plus $71,811.06 in the Bronx.

Q. Turn to the next schedule.

A. The reason we did all this was to try to see if we could check on the amount for maintenance and make the amount due to the Consolidated Gas Company $289,000.

Q. As it appears on Exhibit 94?

A. Yes. We put this all into money, and if the con-
3442 sumption of gas is taken on either of these bases that I have given, subtracting that from the total bill would give you what the maintenance cost apparently would be. In no instance can we check the $289,000.

Q. You might state a little more in detail what this Schedule VI shows.

A. The first column shows the total of bills rendered for each of the different items. The second column shows the cost of gas if the lamps consume three cubic feet per hour, and subtracting that from column 1 would give column 3, which would be the cost of maintenance on that basis. In this case the total of the three columns will be $431,624.95, minus the cost of gas $181,918.69, leaves $249,706.26 for maintenance, but on the other hand, if we take 3½ cubic feet of gas per hour for each lamp and go through the same process the cost of maintenance would become $219,386.48. If we go still farther and take the basis of 3.77 cubic feet per hour for a mantle and 4½ feet for open-flame lamps, the total cost of gas would be $230,059.98. Subtracting that from bills rendered would give a supposed cost of maintenance of $201,564.97. Now in the other line is the Borough of The Bronx. The total here checks out with the total amount of the bills as rendered.

Q. What total do you refer to?

A. The total of the first column which is a total of the bills rendered, $575,383.85.

Q. As a matter of fact can you check the account as it appears in Exhibit 94 with your analysis?

A. No.

Q. Why not?

A. Well, I have just shown you. I have taken all the consumption of gas I could take without doing a lot of unnecessary work, and it does not check out particularly near that amount.

Q. Does the city own the lanterns?

A. No, sir, except in the case of the open-flame lanterns.

3443 Q. How many are there of these?

A. 746 at the beginning of the year.

By the **Master**:

Q. What is that figure for maintenance, $289,000?

Mr. **Mathewson**: Two hundred and eighty-nine thousand and some odd dollars.

By Mr. **Burr**:

Q. Are the mantle lamps owned by the company and leased to the City or supplied under contract?

A. Yes.

Q. And of course the city is obliged to pay the price agreed on in the contract for the service rendered?

A. Yes.

Q. What are the items of service as to street lamps agreed to be performed by the Consolidated Gas Company besides supplying the lamps, does it not embrace lighting, cleaning, extinguishing, maintaining, repairing, painting, replacing when broken, replacing mantles, and furnishing gas of 20 candle-power at one inch pressure?

A. Yes, it covers every service necessary to operate the lamps. The city did absolutely nothing.

Q. Are there any other items to be supplied or work to be done by the Consolidated Gas Company outside of the lanterns under these contracts?

A. Yes, they repair the lamp posts, take down old ones and put up new ones at a regular price.

Q. As itemized in the contract?

A. Yes, and also furnished light to public buildings.

Q. Including services and meters?

A. Yes.

Q. And the setting of them?

A. And the setting of them.

Q. Does the city own the lamp posts?

A. Yes.

Q. Are the repairs to lamp posts paid by the city?

A. Yes.

3444 Q. Under the agreement?

A. Under the schedule in the contract.

Q. Have you an account or bills for these repairs?

A. Yes, the repairs are all given in these bills, as well as the lamp lighters. You will find the repairs at the end of each bill. For instance, the bill of February first, we start in with removals and resets.

By Mr. MATHEWSON:

Q. Are those repairs the one which appears in the second column of Schedule I?

A. Yes, and they continue on through the rest of the bill. Repairs are always going on, and there are repairs practically in all these bills.

By Mr. BURR:

Q. Have you analyzed all these bills for repairs?

A. Yes. That is submitted in Schedule I-*a*.

Q. Is that analysis correct?

A. Yes.

Q. And is the city obligated to pay for these repairs?

A. Yes.

Q. Are these contracts and analyses based upon bids publicly advertised and opened and contracts awarded?

A. Yes.

Q. Were these prices and bids the lowest bids received?

A. Well, there was a question about that.

Q. What do you mean by that?

A. Well, at the time this contract was let, or rather the portion of the contract in 1905, at the time that contract was let, which was March 15, 1904, and extended down to March 15, 1904, there were two other bids for the supplying and maintenance of lanterns only; one in our opinion was not a responsible bid, and the other one was, but it was restricted to a very small area in the city. The doubt we had was this: If you took the irresponsible bid, we will say, 3445 to identify it, which was $13.35 per year, for supply and maintenance of same outside of gas, and added to that the cost of the gas for 3,925 hours at three cubic feet, the amount became lower than $24.75 which the Consolidated bid. It was incomplete, however, but at the same time it left a doubt and it was deemed best to go to the Board of Estimate and Apportionment and ask them if they would recommend the acceptance of the bid and ask them if we could accept the bid of the Consolidated Gas Company. It was submitted to the Corporation Counsel and finally on the certificate of that office that it was all right the Board of Estimate and Apportionment awarded the contract to the Consolidated Gas Company at their bid figure.

Q. The Consolidated Gas Company as a matter of fact made the only bid on the complete requirements as called for by the contract and specifications as advertised?

A. Yes.

Q. Outside of the partial bid you mentioned was there any other competition?

A. Yes, relating to a small area of the city, but if you added the cost of gas to that bid it became higher than the Consolidated, consequently it was not considered.

By Mr. **Mathewson**:

Q. That was from a responsible bidder, wasn't it?

A. Yes.

By Mr. **Burr**:

Q. That is on the theoretical consumption of gas?

A. Yes.

Mr. **Mathewson**: Of three feet?

The **Witness**: Yes.

Q. Outside of these two items there was no competition?

A. No.

3446 Q. Did the city accept these bids?

A. Yes.

Q. As you have stated they were——

A. That is they accepted the bid of the Consolidated Gas Company.

Q. They were referred to the Board of Estimate and Apportionment?

A. Yes, and the department made a contract with the company.

Q. In other words, the Consolidated Gas Company got the contract at their own price although there was a question as to their being the lowest bidder?

A. Yes.

Q. And they will then in time be paid their bid for services rendered under the contract?

A. Yes.

Q. When did this contract expire?

A. March 15th, 1905.

Q. And the bids for the balance of the year were rejected, were they not?

A. Yes.

Q. What were the bids for the balance of 1905 on a yearly basis?

A. The same as the year before, $24.75.

Q. What bids were received for 1906 on this work?

A. In that year the bids were split, there was no bid received for the supply of gas, but there was a bid received for the supply and maintenance and operation and the repairing of mantle lamps at $12.00 a year.

Q. As a matter of fact the price was regulated by the Legislature for the gas, was it not?

A. Yes.

Q. What do you figure the cost of a mantle gas lamp in 1906, basing the cost of supply and maintenance of lantern on the bid, and supply of gas on the legal price for gas, that is, the legislative rate?

Mr. MATHEWSON: You mean the seventy-five cents after July 1st.

Mr. BURR: Yes.

A. $22.37 per annum.

3447 Q. Or to be accurate, how much?

A. $22.3675.

Q. What was the previous price?

A. $24.75.

By Mr. MATHEWSON:

Q. That was all gas at the rate of ninety cents?

A. Yes, included by us at ninety cents.

By Mr. BURR:

Q. Were there any bids received for the year 1906, received from any company?

A. None.

Q. The Consolidated Gas Company having received contracts and to be paid for same at their bid price, including separate payments for repairs to posts and supply of gas to public buildings, should this or any portion of it be charged to the cost of manufacture of gas, as shown in Exhibit 94?

Mr. MATHEWSON: If the Master please, that is purely a conclusion, as to whether any portion of the item of maintenance of lamps should be charged to the operating cost of gas, which it seems to me the Master is to draw. We can argue it, but I don't think the witness can testify to that.

Mr. BURR: He has given you the facts and the analysis of the bills.

The MASTER: I think that is so, Mr. Burr. You brought this witness here to testify to these matters of fact and to the correctness of computation. I do not understand you have qualified him, nor did you undertake to qualify him like Professor Bemis, as a professional gas statistician and then ask what his theories about these figures were. That is the only theory upon which his opinion on a matter of this kind is admissible, is it not?

Mr. Burr: Isn't it obvious if his statement is correct from 3448 this analysis that the Consolidated has been paid by the City what they charge as against the cost of gas in Exhibit 94.

Mr. Mathewson: It is not claimed we have not been paid. The expenditure we have had to make in producing and delivering gas to the private consumers and to the city, preliminary to our collecting anything from our consumers, either private or the City, is an expenditure, as Professor Bemis conceded, which we had to make in advance.

Mr. Burr: No, Professor Bemis did not concede that nor has anybody conceded it. On the contrary it is a matter that is very much disputed by the City. You have here as a part of your operating expenses now $289,000 for street lamps. We showed you here, if we showed anything, that you are fully paid for everything you do in the matter of public lighting of street lamps in the City of New York, and that charge should not be made against the cost of gas and is an inappropriate charge on Exhibit 94.

Mr. Mathewson: When are we paid? When we get our money from consumers for all the coal we purchase, for all the oil we purchase and for all the repairs we make on private apparatus, but that does not make it improper to charge those items in the operating cost of gas, which means what we have got to pay out for making and distributing our gas before we can collect bills from consumers. That, however, is a conclusion which the Master should draw and not the witness.

Mr. Burr: I think he is entitled to answer the question.

The Master: Objection sustained; and the witness may answer.

3449 Mr. Burr: Exception.

A. I think not.

Q. And if not you may state your reasons?

Same objection; same ruling; exception.

A. Because it is a sale of gas, for rentals of lanterns, it is payment for services in connection with some building, it is a contract for repairs to lamp posts and a sale of gas to public buildings.

Q. Do the companies bid prices for each separate item?

A. Yes, sir.

Q. And the City was to pay the amount agreed upon for each item?

A. Yes, sir.

Q. The receipts from the City should be balanced against the expense of the execution of the contract by the company, the balance between the two sides of the account being the profit or loss on this contract only, and not chargeable to the cost of the manufacture of gas to the private consumer.

Objected to as leading, as a conclusion, and as calling for a conclusion upon a conclusion already stated.
Same ruling; exception.

A. In my opinion, yes.

Mr. **Burr**: I offer these schedules in evidence.
Received in evidence and marked City's Exhibit 60.

Q. I omitted to ask you as to the bills, are these similar bills rendered monthly for the year 1905?
A. Yes, sir.
Q. I mean they contain similar items all through the year?
A. Yes, sir.

3450 Mr. **Burr**: I offer one of the bills in evidence, the January bill, dated February 1st.

Received in evidence and marked City's Exhibit 61.

Cross-examination by Mr. **Mathewson**:

Q. The last written contract of the Consolidated Gas Company for supplying public lamps and public buildings was that terminating with March 15, 1905, you said?
A. Yes.
Q. But for the balance of the year 1905 bills were rendered to the city on the same basis as though the contract had been continued?
A. Yes. These are the bills here.
Q. Now, the rates of the bid for the year beginning March 16, 1905, or for the balance of that year, were the same by this company, were they, as the rates fixed by the contract expiring March 15, 1905?
A. Yes.
Q. Did you, on your estimate and those bids, call for a minimum of three feet per hour at the burner?
A. Yes, sir.
Q. And you were aware, of course, if that was observed, that that would mean the burning of something more than three feet on the average at the burner?
A. Yes, sir.
Q. And you called for estimates for the year 1906?
A. Yes.
Q. And that call for estimates prescribed a minimum of three and one-half feet at the burner?
A. Yes.
Q. The Department recognizing that more than three feet would be supplied?
A. Well, it was mainly on account of mantle lamps.
Q. And substantially all of the lamps, as you have shown, were mantle lamps?
A. Yes, sir.

3451 Q. And of course, as the last contract called for three feet per lamp per hour you understood that the Consolidated Company could during that period, that is, the year 1905, bill the City only for three feet per lamp per hour, no matter how much more they actually supplied?

A. Yes.

Q. As a matter of fact the rate of $24.75 for mantle burners which was that fixed in the contract terminating March 15th, 1905, you considered under the conditions existing in New York as reasonable and recommended its acceptance, didn't you?

A. I did, very strongly.

Q. That was at a substantially lower price than the City had been receiving before?

A. Yes.

Q. Now, when you say that all bids for the year beginning March 16, 1905, or rather for the balance of the calendar year, because bids were only called for for the balance of that calendar year, were they, at that time?

A. Yes, sir.

Q. (Continuing:) Were rejected, isn't it true that all bids of all companies were rejected except some bids of the New Amsterdam or Standard Company?

A. Yes.

Q. And those bids of the New Amsterdam or Standard Company were made at a low rate in accordance with that condition which was made, you say, the consideration for their charters or franchises when granted?

A. Yes, sir.

Q. So that in the Borough of Manhattan, as a matter of fact, there were other companies which bid in competition with the Consolidated?

A. Not for mantle lamps.

Q. But they did for open flame lamps?

A. No company bid in the other fellow's area.

Q. However that may be, there were certain companies bid in certain areas in the Island of Manhattan where their areas were located?

A. Yes, sir.

3452 Q. Now, in reference to checking this $289,000 which the company states under the item of street lamps in Exhibit 94, I understand that the Schedule I in City's Exhibit 60 which you present shows in the first column "Lighting," plus the care of the lamps, &c., various items which might be called maintenance, making that first column read "Lighting and Maintenance?"

A. Yes.

Q. And after that the company presented a single bid covering the gas to be furnished and also its maintenance?

A. Yes, sir.

Q. That was not separated in the bid, nor was it separated in the bills of the company, nor is it separated in the payment by the City to the company?

A. No, sir.

Q. The second column on this Exhibit No. 60, Schedule I, refers to certain items of "Repairs," does it not, which were separately provided for in the contract, the company to receive a certain amount for each repair of that character?

A. Yes, sir.

Q. So that the contract with the City and the bids to the City, to sum up, provided first, that the company should furnish certain mantle or open flame burners, should maintain those lamps, including lighting and certain repairs, all for a lump sum, which in this case was $24.75 for the mantle lamps?

A. Yes.

Q. And some other sum for the open flame?

A. Yes.

Q. And in addition to that the contract provided that repairs of certain characters, such as you have defined, should be made at a certain rate for each repair?

A. Yes.

Q. And if the company making these repairs to which I last referred, expended in making them more than the contract provided that they might charge the City, that would mean an expenditure for that repair beyond what would be received from the City? 3453

A. Yes.

Q. Now, you understand from the testimony, do you not, that the sum of $289,000 specified in Exhibit 94, was reached as follows: The company took its expenditures for maintenance, which would come under the first column of Schedule I of City's Exhibit 60, and also take its expenditures for repairs which repairs would be charged off as individual items in the contract, and added the two together and deducted from that the amount which it might charge the City for those repairs; you understood that to be the case?

A. Yes.

Q. So that if the company expended more in making the repairs specified in the second column of Schedule I of City's Exhibit 60 than it received from the City for those repairs, the difference between what the City paid to the company or is to pay to the company altogether, and the amount of gas delivered at the rate specified in the contract, would not give the amount which the Consolidated Company covers by the $289,000?

A. That question is really in two parts, Mr. Mathewson.

Q. Well, I will put it this way——

A. If the company expended for repairs and the City paid for repairs, and the company expended more than the City paid there is a balance to charge off to profit and loss account, of course.

Q. In other words, you made this computation and endeavored to check the $289,000 item of Exhibit 94 upon the theory that the making of the repairs by the company or the cost to the company for making the repairs exactly equalled the amount which the City paid them for those specific repairs?

A. No, I didn't take that theory. The only information I had on the account at all was what I could derive from these bills.

3454 Q. But you know the company——

A. And what I had from Exhibit 94.

Q. But you know the company charged the City in the bills of course only the amount that the contract provided that the company might charge for specific repairs?

A. Oh, that might be.

Q. Don't you understand that to be so? In other words, if the company charged more for making any particular repair——

A. It would not be paid.

Q. So that you understand that the company in these bills charged to the City only the amount which it was entitled under the contract to charge to the City for that particular kind of a repair?

A. Yes, sir; sure.

Q. And if the company actually expended more in making the repairs than it was able to charge the city, then there would be an additional expenditure by the company for repairs which would not be accounted for by this analysis that you have made, would there not?

A. There would be a loss.

Q. In other words, it would be an expenditure by the company which they would not get back from the city?

A. Yes.

Q. Except as they got a lump sum for furnishing the gas and maintaining lamps and that reduced the amount per cubic foot which they really received for the gas furnished?

A. Precisely. If any of us made a contract, stuck to it and lost money on it we would have to charge to profit and loss a loss.

Q. So that until you knew the separate items and the amount of the separate items which the company really had to expend for repairs and maintenance as distinguished from the amount which they were entitled to charge to the City under the contract you would not be able to check definitely the $289,000, would you?

A. No. If you were losing money badly or making very much money.

3455 Q. Yes, exactly. In other words until you have those items showing what the company actually expended and what was included in the $289,000, you would not be able to make a check as to how the company came out in connection with these repairs and maintenance?

A. Not altogether; and yet if you assumed, for instance, that Mr. Addicks' statement is correct as to the cost of gas, the amount of gas that was sent out, and you assumed for instanec that it was seventy-five cents, and you take those figures on the last sheet and you subtract them from the total amount you received at the burner you would receive from maintenance $201,000. Now if you had paid out for maintenance $289,000 you would have a loss of $88,000.

Q. In other words, we would have an expenditure we should have to charge against something?

A. Yes, but not the entire $289,000.

By Mr. **Burr**:

Q. You mean to the extent of $88,000?

A. Assuming that were true. I am merely pointing it out for illustration.

By Mr. MATHEWSON:

Q. I am merely now checking another feature, which is this: If you take the entire amount which the Company is entitled to receive from the City for lighting and maintenance of lamps, plus the amount which the Company is entitled to receive from the City for repairs under the special terms of the contract, and deduct therefrom the amount of gas figured at three cubic feet per lamp per hour and the amount which it is entitled to charge the City for repairs, there would be a balance of expenditures which is represented by this $289,000, you understand that?

A. Yes.

3456 Q. Now, your analysis of these bills here which you have presented in these schedules does not at all contradict that result and it could not.

A. That is the way it is done.

Q. And you could not contradict it until you knew how much the Company expended in repairs and maintenance beyond the amount it received back from the City, could you?

A. No. But in a way we are not trying to contradict your amount.

Q. I know. Well, that is all right. I do not think we disagree at all. Now, let us take the question of the charge of operating cost of gas to these other expenditures in caring for the lamps. It is not the case that all of this $289,000, as I understood you to say to Mr. Burr, represents separate items which are charged by the Company to the City and for which the City must pay as separate items because certainly the greater part of that would simply represent a portion of the amount which the City is to pay the Company for its mantle and open flame burners, covering both gas supplied and maintenance in a lump sum, is not that correct?

A. Yes, that represents a portion of that amount.

Q. Now, so far as the items which are charged for individually by the Company are concerned, that is to say, these specific items of repairs that are covered as such in the contract separately, you understand that all of those items have been deducted in reaching this $289,000 already; do you so understand from the testimony?

A. Well, I had no information on the $289,000 at all.

Q. I didn't know but what you had Mr. Carter's testimony that those items had already been deducted in reaching this $289,000?

A. It does not matter whether they were or not so far as my analysis is concerned, but I didn't have all the evidence that has been introduced by Mr. Carter before me. I heard him the last time he was here.

3457 Q. I merely asked you the question because I think Mr. Burr's question and your answer were a little misleading, and I know they were not intended to be.

Mr. BURR: Let me call your attention to Mr. Carter's testimony upon the subject.

Mr. MATHEWSON: Well, call my attention to the portion to which I have referred, and not to something else.

Mr. BURR: Yes, page 661. I read it as follows:

"Q. You mean you spent $285,701.13 more than you received from the City? A. More than we received from the City for repairing lamp posts. The contract with the City for the maintenance of gas lamps and supplying gas is at so much per lamp per annum, and it does not include any repairs. There is a separate contract for the repairs, stipulating the amount to be charged the City for each class of repairs, and as that repairing is done the cost of work and labor and material is charged against this account, and this bill that is rendered the City for such repairs is a credit to this account.

"Q. And $285,701.13 is the amount you expended in the nominal year ending October 31st, 1905, more than you received from the City or charged to the City for that service, is that as I understand your statement? A. More then we charged to the City, for we received nothing."

Mr. **Mathewson**: That is quite right. In other words, the amount which the company actually expends in repairs is charged to this account. The amount which it charges the City and expects to receive on account of the repairs is credited, so that $289,000 is a balance; those items for which the company has specifically
3458 paid, such as repairs, &c., having been credited on that account and deducted in reaching the $289,000.

Mr. **Burr**: May I inquire whether you claim that this item on Exhibit 94 of $289,000 represents what you claim you spend more than you receive from the City for maintenance and repairs?

Mr. **Mathewson**: I could not state it any more clearly than Mr. Carter has already stated it.

The **Master**: Both of you say $289,000, and it is here in the record $285,000.

Mr. **Mathewson**: That is due to the difference between the nominal year and the calendar year.

The **Master**: He says very plainly here that it is a debit balance of the account.

Mr. **Burr**: It has been contended before the Gas Commission and, I think, stated here that this was merely a matter of bookkeeping.

Mr. **Mathewson**: No, no.

Mr. **Burr**: I shall have to call your attention to that testimony before the Gas Commission, Mr. Mathewson, and that it was, as I understand it, a charge for repairs for which they did not receive compensation from the City.

Mr. **Mathewson**: No.

(A colloquy now ensues between counsel which the stenographer is directed not to report.)

Q. Now, of course, Mr. Lacombe, this cost of maintenance, whatever it is, or this expenditure, if taken out of the operating
3459 cost of gas would be taken out of receipts on the other side?
A. Yes.

Q. So that when you came to take the difference which would be the fund applicable to dividends, there would not be any difference which way you treated it, would there?

A. Why, yes in your account as to the manufacture of gas.

Q. Yes, exactly, but I mean in getting the net profits which we might employ to pay return on our capital it would not make any difference which course you pursued.

A. The profit and loss account is not necessarily the cost of the manufacture of gas.

Q. I think we do not disagree that which ever way you treat it, the balance applicable to the return on capital would be just the same, whether you include this in the cost of gas or whether you include the corresponding amount in receipts or whether you exclude this from the cost of gas and exclude a corresponding amount from the receipts, when you come to figure the result is just the same?

A. So far as profit and loss account is concerned.

Q. And it is simply a question of what the operating cost of gas is and what should be charged in the operating cost of gas?

A. The question is the manufacturing cost of gas.

Q. Taking the irresponsible bidder to which you referred, and adding to his bid for maintenance only the amount of gas which would be required at three feet per lamp per hour at ninety cents or seventy-five cents as the rate provided by law, you would get a result of $23.95 per lamp per burner as against $24.75 by the Consolidated Gas Company?

A. Yes.

Q. But in case you made a separate contract for maintenance even with the irresponsible bidder, and the Company supplying only gas should insist on metering that gas at the lamp-post, it would 3460 be pretty sure, wouldn't it, that they would make the bill higher than $24.75 in vew of the fact that more than three feet per lamp per hour would be consumed?

A. I think it would unless it was governed by something like that.

Q. You took that into consideration among other things in accepting the Consolidated contract, did you not?

A. Yes.

Q. This year you say the Consolidated did not bid for the supplying of gas but only for maintenance?

A. That is all.

Q. Don't you remember there was some special provision in the Act or in the specifications which the Company considered made it impossible for it to bid? Was it not that the gas should be delivered within a certain pressure?

A. Above a certain pressure.

Q. Yes, above a certain pressure?

A. Yes, sir.

Q. And did not the Company say that in view of the pressure law they feared they would be unable to comply with that requirement and therefore they did not feel it safe to bid, in substance?

A. Yes, that is right.

Q. That was the position which a great many other companies took?

A. They all took the same position, and the reason it was asked for is you cannot operate a mantle lamp at a lower pressure and get any kind of service out of it.

Q. One and one-half is the minimum?

A. Yes.

Re-direct examination by Mr. **Burr**:

Q. Do you know of any repairs made by the Consolidated Gas Company to the lamps in addition to those that are specified in detail in the contracts?

A. Well, of course, the contracts do not specify the repairs of little parts of the burner and that sort of thing. It only makes a 3461 sweeping clause of all repairs to the lantern. The City does absolutely nothing; the Company does everything necessary to keep it in operation, no matter what it is.

Q. The object of your contract is to embrace all the repairs necessary to the lamps?

A. Yes, the bid is asked for on that basis.

By Mr. **Mathewson**:

Q. But most of these repairs are included in the lump bid for supply of gas and maintenance?

A. Altogether as to lanterns.

Q. Yes, exactly.

A. Entirely.

Q. And it is only other items of repair which are included in that separate clause and paid for at so much per repair?

A. Lamp-posts, yes.

By Mr. **Burr**:

Q. What is your understanding of this item in Exhibit 94 of this item of $289,000? What does it represent?

Mr. **Mathewson**: I think I asked the witness that and he said he was not informed on that point. He said he had not read the testimony.

Q. Let me call your attention to the testimony of, I think, Mr. Carter, at page 707 of the present record. I read it as follows:

"Well, this item of $289,259.09 represents, then, the entire debit side of the account? A. The entire debit side, account for maintenance and repairs less the amount billed the City for repairs."

Mr. **Mathewson**: Less the amount billed the City for these separate items of repairs. The supplying of gas and main- 3462 tenance of lamps are separate because they are never included by the City or the company in its bill.

The **Witness**: Yes, as far as the City is concerned.

By Mr. **Burr**:

Q. What is your answer to your understanding as to what this $289,000 represents?

A. It appears that according to that testimony after they charge off the amount for repairs to lamp posts there exists something left which included the cost of maintaining the lanterns and supplying them with gas and all that against which they would receive $24.75 per lantern.

By Mr. Mathewson:

Q. You don't understand that that $289,000 includes also an amount which the company will receive for the gas computed at three feet per hour per lamp at ninety cents per thousand?

A. No. I assumed it was a balance, I don't know just what balance it is. Of course I couldn't get that without seeing all your accounts. It was evidently a balance against which a further credit is to go, as I understood it.

By Mr. Burr:

Q. Your understanding of the matter is that the contract embraces all the repairs that were to be made and the maintenance of these lamps and everything was to be paid for in the price stated in that contract?

A. Yes, certainly.

By the Master:

3463 Q. Assuming this $289,000 represents a balance of account, an excess of the expenditure on repair account over what the company received from the City, would you modify in any way your answer to Mr. Burr's question as to whether you thought that was properly chargeable as an expense to gas making, to the cost of gas?

A. If I understand your question correctly, sir, if that was a balance to be charged off to profit and loss as a loss on a contract I should think it would probably go to the profit and loss account, but I do not think it should be charged to the cost of the manufacture of gas, which would be another account.

Q. Then I understand by that that you do not think anything that is in the profit and loss account should be charged as part of the cost of gas?

A. Oh, no. The profit and loss account would be made up by cost of the manufacture and distribution of gas and by other costs that they might be put to by losses in business.

Q. Bad debts, for instance?

A. Yes. Or if they had lost on a contract like this any such amount as that it would be almost worse than a bad debt. It would be foolish.

By Mr. Mathewson:

Q. But if you take bad debts, which may be incurred in a business reasonably well run, isn't that debt included in the operating expense of any industrial business and charged as a part of its operating expenditures before you reach the point where you deduct from total receipts in order to determine what is left for dividends?

A. That is true in certain ways, but it depends upon how the accounts are kept. The profit and loss account of a company, as I understand, must include every possible account of gain or loss. The manufacture of gas is part of the profit and loss account, but it is not all of it.

3464 By Mr. **Burr**:

Q. The repairs are a separate item altogether?
A. They might be part of it, but there are other items.
Q. In other words, a company that was not in the gas business, could enter into a contract with the City to keep the lamps in repair?
A. Yes. In other words, if you wanted to get at the cost of gas on this basis all you need do is to take the profit and loss account and divide it by the total production.

By the **Master**:

Q. Now, put the proposition in this way: Supposing that taking the dealings with the City as a whole the gas company made money on the transaction, they received from the City for their gas and repair more than it cost them for their gas and repairs and so forth, and yet at the same time in the single item of repairs to these lamp posts and so forth they actually paid out more than they received, would or wouldn't that repair item be in your opinion an expense of gas making or part of the cost of gas? There would be no loss on the contract as a whole, and yet in the single item of repairs, they would spend more than they got. Now, would that be part of the expense of gas making?
A. Not in my opinion, no. They make a contract for the sale of certain things and that would be a proper charge against the contract account. If they made a contract with me to sell me a whole lot of different things, they sell it to me at their price which I accept, and of course they have to look to themselves for protection on the price. If they do not make money on the contract that is bad business for them.

3465 & 3466 By Mr. **Burr**:

Q. There is nothing to compel them to make the contract, is there?
A. No, nothing.
Q. The City might make these repairs themselves?
A. There is nothing to compo*le* them to make the contract at those prices unless they wanted to.

Mr. **Mathewson**: And nothing to compel us to go into the gas business at all.
Mr. **Burr**: This is an amazing thing that you are losing $289,000 on a contract with the City.
Mr. **Mathewson**: No, do not say that again, because afterwards you will apologize when you understand it.

Q. Would it not be possible by making an unwise contract to have the Company expend such an excessive amount on maintenance as to make the apparent cost of making and distributing gas in amount double?

A. Reduced to an absurdity, yes.

At 3.45 p. m. adjourned to Monday, October 29, 1906, at 10.30 a. m.

Last Exhibits:

3467 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York; **William Travers Jerome**, as District Attorney of New York County; **Frederick E. Gunnison**, **John C. Davies**, and **Lucien L. Shedden**, Constituting the New York State Commission of Gas and Electricity, and **The City of New York**, Defendants.

Before Arthur H. Masten, Special Master.

New York, Monday, *October* 29, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

3468 **Edward W. Bemis** resumed.

Redirect examination by Mr. **Burr**:

Q. Professor, Mr. Mathewson alluded on page 3100 and asked you whether you had been advocating and were still an advocate of municipal ownership. Has the fact of your former advocacy af municipal ownership or your ideas upon that situation or proposal affected your judgment at all in this case?

A. It has not. In fact, I might add that while I have been employed in a good many gas cases, I have never been employed in a case, so far as I recall, in which the question of municipal ownership was up at all, except, I may say, that Montreal asked for what it would cost the city to put in and operate a plant; to that extent, that was an exception; but, barring Montreal, I would say that municipal ownership has not entered into it at all.

Q. Do you consider that municipal ownership is in any degree directly or indirectly an issue in this action?

A. No.

Q. You were retained by the city, were you not, months ago to support the claim of the city of this action, that the rate fixed to the city and the rate fixed as to the general consumer are no- confiscatory, as would appear by the evidence in this case?

A. I was so retained by the city many months ago.

Q. Had Mr. Hearst or Mr. Shearn anything directly or indirectly to do with your testimony or your action or your activity in this case?

A. No.

Q. You were acting solely, were you not, in behalf of the corporation as represented by myself?

A. Certainly. I don't think they even knew of my being retained at the time I was retained.

3469 Q. Now, before taking up in detail the points brought out on your cross-examination, do you desire to make any changes in the statement you gave on direct-examination, and if so, will you briefly state what such changes are?

A. I have discovered only two or three points bearing on the matter of cost of gas in which I see any occasion to modify what I gave on direct-examination. Those changes that I am now able to make are these:

First, an item of about $196,000——

Mr. Mathewson: Can you give us the page where this testimony occurs which you propose to correct?

The Witness: Well, it practically all relates to the table on capitalization.

Mr. Mathewson: You need not take time to look it up.

The Witness: Pages 3046 and 3052 practically summarize the points I wished to refer to. On page 3046 I omitted in the capitalization an item of $196,419.01, being the increase during certain months in the middle of 1884, between the time when Mr. Yalden made his report and the time of the final consolidation. Six per cent. on that, however, would only be $11,760, or less than one-tenth of one cent per thousand feet of annual sales.

The second change is that I included in miscellaneous income, which should properly be deducted from expense, $5,000 from dividends of the National Coal & Coke Company. That I now think should not have been included. That item of $5,000 a year plus the six per cent. on the $196,000 just referred to, makes about $16,760, or about one-seventh of one cent per thousand feet of sales.

3470 Finally, in bringing out the reasons for allowing an operating cost of 48.63 cents, which I used on page 3052, I made a statement that I did not think more than one cent per thousand feet in the cost of the gas at the Consolidated Coal Gas plant as compared with the coal gas works of the Central Union was due to the difference in the price of coke. My later computations, which I will give more in detail a little later this morning, makes me belive that about four cents is the real difference as far as affected by the price of coke, or three cents more than I allowed. And I further think that there is a small point in the matter of somewhat larger repairs being necessary in a plant like the Central Union, requiring or using machinery. I think one-half cent to one cent

per thousand feet will cover that difference, while, as I have said, I will allow three cents more on account of difference in the price of coke, or a difference of four cents in all per thousand feet of coal gas sales. This four cents multiplied into the three billion feet, substantially, of coal gas made and divided by the thirteen billion feet of all gas made, only adds about one cent to the cost which I allowed per thousand feet so far as due to this larger allowance for coke and for repairs of the coal gas machinery, charging and drawing machinery, coal handling machinery generally, at the Central Union works. This added to my 48.63 cents would make 49.63 cents. I do not state that the cent ought to be added, because it may be that there should not be that difference in the price of coke with proper energy in the sale of it by the Consolidated, but the facts seem to indicate that there is that difference, and on that basis, then, I find, not that my former reckoning was wrong, for there is the difference of operating cost between the Central Union and the coal gas plants of the Consolidated Gas Company, which I stated, and which I used as one of the factors in reaching the 48.63 cents.
3471 I merely add now that perhaps one cent of the expense is inevitable on the part of the Consolidated, so that 49.63 or, roughly, about 50 cents may be the just operating cost that up-to-date plants on the island, doing as good work as the New Amsterdam, Central Union and Standard, and with such price for oil as is paid in eastern Massachusetts, and with the seven cents allowance for distribution expenses, other than taxes and repairs, instead of the 9.45 claimed by the company——

Mr. Mathewson: And without any allowance for reserve fund if one should be allowed?

The Witness: Yes.

Q. Is that as fully as you wish to state?

A. Other points may come up as you go on, but I think that is all for the present.

Q. On page 3098 of the testimony you were asked by Mr. Mathewson as to your connection with the Cleveland Water Works and the nature of your duties in connection with those works, having called attention to the fact that you never actually operated a gas plant. Will you tell us a little further than you did in reply to that question what your duties are there in that water works plant?

A. The management of the entire department. We have a very large pumping station, which consumes over 60,000 tons of coal a year. We have about the same mileage of mains and of larger average size than those of the Consolidated Gas Company. We have the same problems of repairs of mains, electrolysis, etc., and services which they have, only water mains are always attacked worse than gas mains if there be any electrolysis. We have the same problems of reading meters and making out bills, for Cleveland during the last four years has attained the position of
3472 having the most water meters of any city in the world; I have set over fifty thousand; and the collection department and general office expenses are somewhat on the same basis as a gas works; so that the problems are not so very distinct and different.

To be sure, the City of Cleveland is not as large as the City of New York only half a million instead of over two million; but we have 70,000 services in use and we have to deal with every consumer in the city; they all use the city water.

Q. So, in your opinion, many of the questions which arise in a gas plant arise in this institution of which you are superintendent?

Mr. Mathewson: I object. I think that is a conclusion.

The Master: Oh, Well, that is a conclusion which I could draw, I should think. He has already said the questions are similar.

Q. Now, Professor, on page 3105 you were asked if you had not read the testimony that the Central Union Company was able to sell large quantities of its coke to the New York Central & Hudson River Railroad Company, which was delivered on the cars of the company, which were run into the station yards for that purpose, so that there was apparently no expense in storage or handling or breakage incident to the rehandling of coke, and you stated that you did not remember fully. Have you anything further to add to that suggestion of Mr. Mathewson's now?

A. I have not yet come across the reference to some of the coke of the Central Union being taken by the New York Central, but I have come across this important fact, which is given in Exhibit 22 of the Central Union Case, pages 210, 212 and 215 of the printed copy of the Central Union case on appeal: Out of 85,167,560
3473 pounds of coke produced for sale by the Central Union Com-
pany during this year we are talking about, ending October 31st, 1905, 23,155,050 pounds were used in the water gas department, and the rest, 60,012,510 pounds were sold for the gross price of $114,663.76, or nineteen cents per hundred pounds; while the expense for the cartage borne by the Central Union Company on that coke was $20,935.91, or three and a half cents per hundred pounds, leaving a net price of 15.5 per hundred pounds. This would indicate that the Central Union had to pay nearly twenty per cent. of its gross receipts for coke in order to cover cartage.

In a similar way I found in City's Exhibit 56, which was Exhibit 145 before the State Gas Commission, that the cartage and labor of handling the coke produced at the 14th Street station was 2.7 cents per hundred pounds of coke, or also about twenty per cent. of the gross price of said coke, which was 13.8 cents. And 42d Street, according to the same exhibit, the cost of cartage was only 1.1, or about nine per cent. of the 12.9 gross price of the coke produced at that station. On the whole, then, the cost of labor and cartage of coke to the 14th and 42d Street stations was less than to the Central Union. This is largely due, I believe, to the fact that much of the cost of coke delivered in the case of the Consolidated was borne by another company, known as the National Coke & Coal Company, but the facts just given show that the Central Union does have considerable expense in the cartage of coke.

Q. Now, on pages 3111 and 3113 you were asked how you got the figure of $3.23 a ton for coke made by the Central Union and what was the market price of the coke sold by the Central Union rather than the price at which they valued the coke transferred from the coal gas to the water gas department of the plant. What have 3474 you to say about this?

A. As I stated in my testimony, I obtained the quotient of $3.23 a ton of coke at the Central Union by reducing the 23,155,050 pounds of coke to tons, transferred from the coal to the water gas department of the Central Union, and then divided the number of tons into the $37,381.56 given by the company as the value of said coke. In doing this I assumed 2,000 pounds of coke to the ton, as that is the number of pounds in the ton of coke that I was familiar with in Cleveland and the West generally, and which I supposed applied to New York City, although I knew that coal was bought by the long ton of 2240 pounds. Mr. Carter, however, I understood to say during my cross-examination, that he had used a ton, in the case of coke, to mean a long ton.

Mr. Burr: Is that a fact, Mr. Mathewson?
Mr. Mathewson: Yes.

The Witness (continuing): To mean a long ton, as Mr. Carter now states; the same as in the case of coal; consequently, in making any comparison between the price of coke per ton in the Central Union and the Consolidated Gas plants I should have used the long ton, which would, of course, have reduced my divisor about ten per cent. and increased the quotient or value of coke at the Central Union about ten per cent. The number of tons would have become 10,377 instead of 11,577½, and the average price would have become $3.62 instead of $3.23.

With regard to the other point, as to whether the Central Union valued the coke used in its water gas at the same price at which it sold its coke, I have discovered, as already stated, that the 60,012,510 pounds of coke sold yielded nineteen cents per hundred 3475 pounds before deducting cartage, and 15.5 cents after deducting cartage.

Now, I found that the 23,155,050 pounds of coke used in the water gas plant, which was valued, as I have stated, at $37,381.56, or 16.1 cents per hundred pounds, is in reality .6 of a cent higher per hundred pounds than the net price received for coke sold in the open market. I do not, therefore, recognize any unfairness in the figure I took, but would have used, of course, the absolutely correct figures if I had been possessed of this later information, which I was not aware was in existence at the time of my testimony on direct examination.

Q. How was it you did not have those figures at the time of your direct testimony?

A. It was because the evidence from the Central Union on that point was not in the typewritten volumes of evidence bearing on the Central Union case that I had the privilege of examining.

Q. You mean the exhibit which Mr. Mathewson called your attention to in the printed copy of the testimony in that case was not part of the typewritten record which the City had in its possession?

A. Yes, sir, and I did not know that I could have consulted an original copy at the office of the Gas Commission. I was not familiar with the fact that there had been such a statement presented to the State Gas Commission.

Q. So, after having an opportunity to consult those figures, you are glad of an opportunity to correct your testimony in that regard?

A. Yes. I may say I had prepared a form of question for Mr. De Ford to present to any gas companies outside of the Consolidated that he wished, but as I did not appear in those cases and they came later than the Consolidated, I was not aware to what extent he had obtained information along those lines.

3476 Q. And that refers to the Central Union?

A. Yes.

Q. You were asked on page 3116 whether the price which the Consolidated gave as the value of coke at its coal gas plants and the price which it charged itself for coke in its water gas plants corresponded to the price which it obtained for coke in the open market. What have you found as to that, Professor?

A. The coke produced for sale at the 14th Street station in the year under discussion, ending October 31st, 1905, was 57,844.06 tons, or 129,570,694 pounds. The gross value of this was given in City's Exhibit 56 as $178,527.11, or 13.8 cents per hundred pounds. The net value, after deducting cartage, was given at $143,706.08, or 11.1 cents per hundred pounds. Likewise, in the case of 42d Street, the 56,932.93 tons, which is equivalent to 127,529,763 pounds, produced for sale in the coal gas plant is given as worth $164,999.83, or 12.9 cents per hundred pounds, less cartage of $14,234.34, or 1.1 cents, leaving a net value of 11.8 cents on 33,955.43 loads. The 33,955.43 loads, or 50,933,145 pounds of coke, counting 1,500 pounds to the load, sold by the three water gas stations of the Consolidated, is given as worth, after adding cartage, $74,862.97, or 14.7 cents per hundred pounds. The difference between 14.7 cents at the water gas stations and 11.8 at the 42d Street coal gas plant, a difference of only about 3 cents per hundred pounds, does not appear to me unreasonable in view of the fact that the coal had to be carted from the coal gas to the water gas stations. With respect to the comparison between either price and the price at which the coke was sold in the open market, I have the following information:

In City's Exhibit 44, page 804, being a reprint of an exhibit before the State Gas Commission, prepared by the gas
3477 company at my request, appears this question:

"Amount of coke and receipts therefor?"

In their answer the company gave the coke produced for sale at both the 14th and 42d Street stations and its value, and then deducted the labor and cartage, and that let the figures which I used. I don't see what better evidence I could have that the company professed to give the actual receipts for coke at the two coal gas stations.

I also find in State's Exhibit J (page 414-a) that the coke sold by the Consolidated during the calendar year ending 1905, to outside parties, was 117,940.7 loads, for which $260,118.34 was obtained or $2.205 per load was received. The coke used at the water gas stations (same exhibit) is charged at practically the same price, $2.25, taking account of cartage, and the same represents the figure I last gave for water gas. That same value is placed on the coke used at the distributing stations and shops. I do not see, therefore, that I made any mistake in taking the receipts for the coke of two coal gas stations of the Consolidated as given by the company in City's Exhibit 56.

Q. I call your attention to the bottom of page 3117, where Mr. Mathewson states, so far as the cost of the Consolidated gas as a whole is concerned, it makes no difference; it credits its coal gas plants with coke transferred to the water gas plants and charges the water gas plants correspondingly, provided it used the same figures. Has the statement you have just made answered the objections made by Mr. Mathewson on pages 3116 and 3117, as stated by him?

A. I think they do. It seems to me, so far as I can learn, that the price to outside parties, taking account at least of cartage, is 3478 substantially the same as the price at which the coke was transferred between the coal and water gas stations of the Consolidated.

Q. On page 3119, your attention was called to the fact that the cost for labor at the Central Union was 5.89 cents per thousand feet in making coal gas, while at 14th Street 7.65, or about thirty per cent. higher, and at 42d Street 11.52, or about twice as high, and you were asked on page 3119 and 3120 whether this might not be explained by the fact that the coal and water gas were made under the same roof, and therefore economies might have occurred because of that fact. What have you to say as to that?

A. I don't see how the economies could have been any greater than the economies that might occur at the 14th or 42d Street stations, provided they were up to date, for at either one of the latter two stations the coal gas made is not greatly different from combined coal and water gas at the Central Union station.

Q. On page 3130 your attention was called to the fact that according to Exhibit 171 before the State Gas Commission, the reported price of the coal and water gas furnished by the Central Union to the Consolidated during the four months ending October 31st, 1905, under the new law as to candle-power was 34.45 cents, indicating operating costs of 31.33 cents. How much lower do you find that to be than the station cost of the gas made by the Consolidated as given in the same exhibit?

A. It is 34.35 cents. I have it here. The difference is 4.27 cents. Exhibit 171 reports the cost of the gas made by the Consolidated for those months as 35.6 cents. This exhibit was prepared by the company.

Q. On page 3130 you are quoted as stating that in Table 7 you had reported the station cost of the Standard Company on page 2078 as 20.23 cents for the year ending October 31, 1905. How should 3479 the answer have read?

A. It should have read page 2978 instead of 2078, and the cost should have been stated as 30.23 cents. It must have been a typographical error.

Q. On page 3132, you were asked by Mr. Mathewson if it was not to be expected that there would be a difference of one cent or two cents in the cost of manufacture of gas between different companies in the city. Have you anything further to say on that point?

Mr. Mathewson: The answer was yes, wasn't it?

A. I would merely like to emphasize the fact that the difference in this company was more than was stated in the question. It was 2.77 cents, taking account of the difference in candle-power and meant a difference in the total production of water gas of the Consolidated as stated on page 2980 of $201,753.30. I am surprised to find that the largest company——

Mr. Mathewson: I move to strike out from "I am surprised to find——" If the Court pleases, the question was whether he would not expect a difference of a cent or two, and his answer was yes, and this examination so far as this point is concerned is not re-direct at all, it merely goes into a different subject.

Q. What do you find the fact to be?

A. I find the largest and the oldest company has the larger cost. If I had taken the New Amsterdam Company alone for comparison with the Consolidated I would have noted that it not only operated at a cost of 2.28 cents less but furnished an average candle-power of .88 of a candle more; worth, according to the claims of the 3480 Consolidated, over .72 of a cent on the basis of oil at 4.04 cents per gallon. This added to the 2.28 makes 3 cents of inferiority on the part of the Consolidated. This multiplied into 7,850,323,000 feet of coal gas made by the Consolidated means an excess cost of $235,510.00 or more than the figures which are used in Table 7 on the basis of comparing the Standard and New Amsterdam together with the Consolidated water gas stations.

Q. You were asked on page 3134 as to the candle-power maintained in Boston and whether they did not there maintain an average of 3 candle-power above the standard and you said they did. Have you any further information on that point?

Mr. Mathewson: Is it necessary? I thought he had finished his direct testimony.

Mr. Burr: Well, as to the reason for that.

Mr. Mathewson: I asked him whether the candle-power was greater and he said it was about 19. I cannot see any point in going into that further, I confess.

The Master: I do not see what the point of it is unless the question is made a little more specific, Mr. Burr.

Q. Have you any reason to qualify the answer given by you at that time?

A. I am rather strengthened in my position by observing that in London according to Field's Analysis——

Mr. Mathewson: I protest against this.

Q. In what respect?

A. Why there is only a difference of half a candle-power there between the legal requirement and what they maintained.

Mr. Mathewson: I move to strike out all this statement. The simple question was whether in Boston the candle-power was 3481 19 and he said it was and showed by the report filed with the Commission exactly what it was. He apparently wants to proceed and put in additional arguments here in his re-direct which he should have presented in direct, if at all.

The **Master**: Strike it out.

Mr. **Burr**: Exception. You were making a point as to the fact that the candle-power in Boston was of a different kind from that in New York and you were drawing an inference which I wish to rebut, if I may, by his explanation.

Q. You were asked if they did that to obey the law. Now, I want to know whether you found that to be the fact or not. Did they?

The **Master**: He said they did not do it to obey the law and he was asked what he understood they did it for, and he said to compete with electricity, and because it was a good policy.

Mr. **Burr**: If he has upon investigation any reason to qualify his answer, I suppose he is entitled to qualify the answer in any respect. It is not a cast-iron rule that after giving an answer you must be bound by it, even on his re-direct.

Mr. **Mathewson**: If his answer is wrong, I have no objection.

Mr. **Burr**: Or if he wants to modify or give additional reasons for his answer he is entitled to do it. The Master has ruled it out. I take an exception, and you may answer.

A. The last issue of Field's Analysis of the principal British gas illuminating companies for the year 1905 shows that the dif- 3482 ference in London between the prescribed candle-power and that supplied was only .48 of a candle in the case of the London Gas Company and .6 of a candle-power in the case of the South Metropolitan Company, and did not exceed a candle in the case of eight out of twelve suburban London companies.

Q. And from knowledge of these facts would you conclude there is actually no necessity for the large difference which exists between the prescribed candle-power and the actual candle-power as found by the tests both in Boston and in the City of New York, as relates in the first instance to the Boston companies, and as relates in the City of New York to the Consolidated Gas Company?

Mr. **Mathewson**: Objected to as leading in the highest degree, and as a conclusion which the witness is not qualified to draw, as not being a gas expert; and if it depends upon figures that he presents the Master can draw it just as well as he can, if it is to be drawn.

The **Master**: I think the question is objectionable, Mr. Burr.

The **Witness**: Here is Field's Analysis. I can verify my figures if anybody doubts them.

Mr. **Mathewson**: It is not a question of doubt. It introduces another subject that we ought not to go into.

Q. Well, what do you conclude from these facts that you have stated?

Mr. **Mathewson**: Objected to on the grounds just stated to the last question.

Objection sustained.

Mr. **Burr**: Exception.

3483 A. I consider that it tends to show that it is not necessary to have any such large difference as exists in Boston or existed during several months of the last two years in New York City.

Q. You were asked at the bottom of page 3134 by Mr. Mathewson this question:

"In your examination of the tests of Professor Love subsequent to July 1st, 1905, did you find that in spite of the average that the Consolidated Gas Company maintained, yet, on various occasions, the candle-power has dropped to 22 or very close to it."

Have you investigated that matter further and do you wish as a result of such investigation to modify your answer in any respect?

A. Yes.

Q. Please do so.

A. I misunderstood the question. I thought it related to the whole year 1905 and not simply to the last six months. I did not grasp the word "subsequent," in other words, in the question. During the last six months of the year there were 151 days on which the gas in each of the five stations was tested by Dr. Love, making in all 755 tests. There were only five days in which the average of the tests of the five stations fell below 23 and only one day in which it fell below 22.6. Of the 755 tests at the individual stations only thirty fell below 22.5, while there were 175 tests or nearly one-quarter of the whole that were over 25, and more than six-eighths were above 23. The candle-powers fell below 23 chiefly in September and October, yet the average even for the lowest month, September, was 23.65. The average candle-power for the six months were 24.18 while the law only required 22. The average candle-power during the last half of 1904 when the law required 20 was 21.08. In other words, during the last six months of 1904 3484 the company gave 1.08 candle-power on the average in excess of the legal requirement, but during the last half of 1905 it gave 2.18 candle-power in excess of the legal requirement.

Mr. **Mathewson**: Now, if the Master pleases we are met with this proposition: I asked the witness in order to test the care of his computation as to whether he had examined the individual or had made the individual examinations to see whether on various occasions they did not drop below 22 (page 2134). He said yes they did, he said in another place he had not the individual computations with him. Now the witness goes off between the cross and re-direct, makes an examination, brings in the year 1904 and makes another argument which was not called for by the questions at all, and it strikes me it is not proper or fair re-direct examination. If the examination had continued at that time it would have been ended and I do not think that the witness's subsequent investigations are matters of re-direct examination.

Mr. **Burr**: If a subsequent investigation requires any explanation or modification of his answer made during some question you put, he is certainly entitled to give it on re-direct examination when you have not called his attention to the situation by your cross.

Mr. **Mathewson**: He has now gone into a subject which requires a further examination and gives an answer that is simply poppy-cock when the facts are concerned.

Mr. **Burr**: I move to strike that out.

The **Master**: Gentlemen, I think we had better stop all the speeches. There is no motion before me. The question was
3485 proper if Mr. Mathewson did not object and has not moved to strike out the answer.

Mr. **Burr**: The table showing the variation between the prescribed illuminating power and that actually supplied by the London companies appears upon page 2 of Field's Analysis, and I think at this point I will read it into the record. I think this is recognized as the standard book upon the subject.

The **Master**: I understood I had already excluded this question of going into the London candle-power as not re-direct examination. I allowed this last question with regard to his examination of Professor Love's tests on a different theory altogether, but the London candle-power matter was excluded and I shall make the same ruling if Mr. Mathewson objects to it.

Mr. **Mathewson**: I object to it.

The **Master**: Objection sustained.

Mr. **Burr**: Exception. The point is, if it should be allowed, I want to have coupled with the answer the actual official proof contained in these two lines of the facts which I wish to have before the Court; that is, as to the amount of candle-power required, and the actual candle-power supplied.

The **Master**: I will exclude it, the reason being that when the witness was on the stand before the witness was asked some questions on the subject and stated he did not know the facts regarding the London candle-power, and I do not think it is proper re-direct examination for him to go off during the recess and come back with a new set of theories or tables on the subject, based on those statistics.

Mr. **Burr**: Not even if it tends to modify his former answer or explain his former answer.

3486 The **Master**: Well, I do not see that it does.

Mr. **Burr**: Well, I won't stop to read that into the record. Attention has been called to the place where the tables appear and he has already stated in his answer the exact figures with regard to the candle power actually required and that actually supplied.

Q. Much time was devoted to, and many questions were asked you regarding, the alleged conflict in your testimony with respect to the price of oil in Boston at the time of the hearings before the State Gas Commission on pages 3141, 3147, 3159 and 3166?

A. Yes.

Q. Is there any correction you desire to make in your testimony in that regard, or do you wish to amplify it in any way?

A. The only mistake I have discovered in my testimony at any time with regard to this matter was on page 3142 in reply to a question by Mr. Mathewson when I stated that the price of about 4½ cents per gallon in Boston was the average price for the year ending June 30th, 1904. In reality it was, so far as I have been able to ascertain, the average for the following year, but I had not looked at my notes on that subject for a long time and got the date wrong. That contract in Boston, a copy of which has been produced by Mr. Mathewson on cross-examination, was dated May 9, 1904, and was for 7,500,000 gallons of oil. If it began to run immediately thereafter the oil would probably have been all used up under that contract by July 1st, 1905, for the Boston companies use 6,200,000 gallons of oil every twelve months, which I learned from their return to the Massachusetts Gas Commission. Therefore in the light of the fact that the oil used in Boston with the exception of one-half of one per cent. of naphtha during the year closing June 30, 3487 1906, averaged only 4.01 in price, although mostly only 34 degrees gravity, is an indication that a new contract has been made since the one I saw. When I was asked, January 9, 1906, in testimony before the State Gas Commission (pages 1303 and 1304), with respect to the price of oil in Boston, I was not asked, neither could I have told, what price was then being paid in Boston, but I was asked about the contract I had seen a year before and I didn't know in January, 1906, that the price had fallen in Boston six months before I testified here in New York.

Q. Referring to page 3157 and to the letter which was quoted on that page from President Richards of the Boston Company, and to your subsequent cross-examination upon that by Mr. Mathewson as to the situation in Boston, regarding the kind of oil and the price of oil, have you anything further to add?

Mr. Mathewson: Is this a correction?

Q. Or do you desire to modify your answers as given on your cross-examination, in any respect?

A. Yes.

Q. If so, please proceed.

A. In table 4 of my testimony (page 2972), I gave the gas oil used by the Standard Gaslight Company during the year ending October 31st, 1905, as 11,639,544 gallons, costing at 4.0903 cents $476,100.56. I also gave in table 5 the gas oil used by the New Amsterdam Company as 23,175,882 gallons at 4.0023 cents or $927,577.18. The total oil used——

The Master: How does this have any bearing on this testimony to which you have called attention at page 3158, that is, about the price of the Boston oil.

3488 Mr. Burr: In instituting a comparison with the situation in Boston, he relied upon information which was contained in that letter. That information was subsequently modified by an additional letter from President Richards, which was sent to him evidently as a result of having a communication from the complainant company, and upon the new situation as he finds the facts to be from President Richards' second letter, he desires to make this explanation which may affect the tables he gave, Nos. 4 and 5.

The Master: What he is saying is to modify his table on page 2972 instead of modifying his testimony on page 3158.

Mr. Burr: But so far as that testimony given on the latter page affects those tables on the prior pages in the item of oil——

Mr. Mathewson: But this testimony on the prior page 2972, is taken bodily from the Exhibit in the case of the Standard Gaslight Company before the State Gas Commission, simply taking the items of manufacture, showing or purporting to show the station cost to the Standard Company as per the Standard Exhibits. This table 4 is simply part of the Standard Exhibit before the Gas Commission and has nothing to do with Boston, and none of the figures there are made up from the Boston prices or purport to be.

Mr. Burr: You have laid great stress upon his testimony as to the price of oil in Boston. Now——

Mr. Mathewson: What has that to do with this Standard Gaslight Company Exhibit?

Mr. Burr: He is now proceeding to call your attention to the facts as he has ascertained them positively to be in connection with 3489 the Boston oil situation and as the same can be applied to these exhibits that are now in evidence referred to.

Mr. Mathewson: Oh, that is a further argument, then. I object to this, Mr. Master, as not redirect-examination; and, furthermore, as being immaterial anyhow.

Mr. Burr: I think it is very material because he originally started out to institute a comparison between the situation, so far as oil is concerned, that exists in Boston and New England and the City of New York, and you by cross-examination showed that in certain respects he had possibly made a miscalculation. On his re-direct I asked him now to explain fully with regard to the particular matter of oil and its similarity or dissimilarity as the situation exists between New York and Boston.

The Master: I will overrule your objection, Mr. Mathewson.

Mr. Mathewson: Exception.

The Witness (continuing): The total oil used by the two companies was 34,815,426 gallons, costing $1,403,677.74 or 4.032 cents per gallon. This indicates that all the oil used by these two companies was 28 degrees gravity because the testimony is that they used the oil bought on the contracts of the Consolidated Company, which provided that the 28 degrees gravity during that period should cost only 4.04 cents. It is also to be noted that using that quality of oil, those two companies were able to maintain an average candle-power every month, with the exception of one month in the case of the New Amsterdam, sufficient to comply with the new law as to candle-power, as I showed on page 2995. Similarly, the 3490 Consolidated Gas Company, as shown in Exhibit 93, paid an average of 4.08 cents, which would indicate that 92.6 per cent. of the oil was of 28 degrees gravity Beaume test. Now, I have here the copies of the annual reports of several Massachusetts companies for the year ending June 30th, 1906, recently filed by these companies under oath with the Massachusetts State Gas Commission. From this it appears——

Mr. Mathewson: Now, just a moment. I again renew my objection, especially to this matter which the witness now proposes to go into. He has examined since the adjournment reports of other Massachusetts gas companies and proposes to deduce other arguments from those. Is that fair?

The Witness: It is practically the same companies.

Mr. Mathewson: Well, the same companies.

The Master: I will allow him to proceed.

Mr. Mathewson: Exception.

The Witness (continuing): From this it appears that the average price of oil at Springfield given on page 22 of the return was 3.6 cents, average price of oil in Fall River was 3.01 cents; in Lynn 3 cents; in Lowell 3.13 cents, save for a small amount of naphtha. I have no evidence as to the quality of oil used by Springfield or Fall River but Lynn used 28 degrees gravity and Lowell used 29 degrees gravity. I have here a letter from Mr. A. C. Pease, superintendent of the Lowell Gaslight Company, dated October 10th, in which he makes the statement that the oil used was about 29 degrees Beaume. An engineer and personal friend of mine has been informed——

3491 The Master: That is a little beyond anything that there is any justification for.

Mr. Mathewson: I move to strike it all out.

Q. What do you say as to Fall River?

The Master: This very table about which the witness says he is testifying now, I do not see that what he has thus far said has any relevancy to the table. This other table on page 2972 was put in evidence at the hearing of October 16, and he is now referring as part of his testimony to a letter from a man in Lowell on October 10th, if the letter from the man in Lowell on October 10th had any relevancy to the issues here it should have been produced on his direct-examination.

The Witness: I had it then in my hand right here.

Mr. Burr: Mr. Mathewson, as you remember, devoted a great deal of time to weakening the point he originally made in regard to the oil contract, and I want to give you all the information he has had. It is only a very short matter now.

The Master: You are quite right in that, Mr. Burr, but it seems to me only fair to Mr. Mathewson that if there is to be any correction or any change in the testimony brought out by him on cross-examination that it should be done by specific questions and manifestly not to open the door for a long disquisition or general statement by the witness on subjects which apparently ought to have been taken up on his direct-examination. It is unfair to opposite counsel. It imposes too much of a burden on him. You will have to take the witness in hand and question him as to the specific matters 3492 you want to bring out. There is evidently a long discourse here, the relevancy of which is not apparent to me.

Mr. Mathewson: I might add to that that it compels me to waste the time of this tribunal either in cross-examination to bring out the facts and distinctions, or else on my own case to take the time to do it then. It is easily answered, but it takes time.

Q. What do you find the oil used at Fall River to be, so far as the gravity is concerned?

Mr. Mathewson: The witness has already stated his information on that subject and the sources of it, which is not very conclusive.

Q. Will you be a little explicit so that we can have this matter cleared up? What is it you desire to show by these figures you are now ready to produce before the Master?

A. I desire to say this. On my direct-examination I gave the fact about the price of 28 degree gravity and of 34 degree gravity oil in two or three places in Massachusetts. A great deal was made of the modification as to the 34 degree gravity by President Richards, and some aspersions were cast upon the accuracy of the 28 degree test, of the price of that. I wanted to back up my statement as to the 28 degree test and show by last year that was practically the only oil used in New York anyway and that the Standard and New Amsterdam maintained the full candle-power on that. Also that whatever becomes of the price in Boston it does not account for 5 per cent. of the whole business. Practically the whole thing is a 28 degree gravity oil, and that remains unassailed except some suspicions were thrown out that it could not be correct and I am very sorry
3493 that I left at the office the letter—I will bring it this afternoon, from Superintendent Pease of Lowell regarding oil being 29 degrees Beaume test and also bring down the Massachusetts Gas Commission report from Lowell which is handed in under oath by Lowell, showing it was 3.13 cents, Lynn 3 cents, and Fall River 3 cents.

Q. In other words you wish to call attention to the fact in connection with your prior testimony that ending October, 1905, the Consolidated began to pay 4.29 cents for the same quality of oil, or more than 1¼ cents in excess of the price in Eastern Massachusetts?

A. Yes.

Q. Which locations are further from the oil fields, I believe you testified on your direct-examination?

A. Yes, exactly.

Q. And it appears further that they began mixing with this oil an oil costing them 4.875 cents per gallon, making an average cost, if they mixed it equally, as they did during the last six months of the year 1905, of 4.58 cents?

A. Yes.

Q. And you wish to draw the comparison which that statement——

Mr. Mathewson: Hasn't he drawn the comparsion in his direct-examination? Every particle of that he has gone over, drawn his comparisons between the cost of oil here and the cost he said it was in Massachusetts, and figured out the difference and said it would make, taking this and other things into consideration, something like six cents difference, that he thought we should take advantage of in New York if conditions were as he assumed them to be.

The WITNESS: The only point I chiefly had in mind was
3494 that the modification in Boston scarcely affected the situation
five per cent., because the oil used here was mostly up to within a few months——

The MASTER: So far as I can see, this is all a matter of argument from the facts you have testified about on direct-examination.

The WITNESS: Well, I will put in the letter this afternoon, if I may, from the superintendent at Lowell.

Mr. MATHEWSON: I shall object to the letter.

Q. And from these figures that you have given here and your previous testimony given here, what would you say as to the price for oil as given in Exhibit 93, to what extent that is reasonable or exorbitant in your opinion, over and above the price to which you have referred, that applying also to the price of oil as given in Exhibit 94?

Mr. MATHEWSON: Exhibits 93 and 94 show the costs for the nominal and calendar year 1905. The witness is asked what his opinion is, whether it is exorbitant what we pay. He has shown what we pay and purports to give from one source or another what other companies have paid. There is no comparison of conditions, and the witness never bought any oil, yet he is asked to state whether the price we pay is exorbitant. It is utterly incompetent.

The MASTER: There is a lot of evidence in here as to the price of oil everywhere, from which they seek to argue that the company pays more than other companies do. There is the fact. Now, how it adds to the witness's testimony to say that that is exorbitant when
he is not a dealer in oil, I do not know. It does not hurt
3495 Mr. Mathewson any if that is all there is of it, but I do not
want to have a long disquisition go on the record.

Q. Is it not a fact that the price of oil as given in Exhibit 93 is in excess to the extent of over 1 cent a gallon, and the price in Exhibit 94 is in excess by over 1¼ cents per gallon as compared with these prices you have spoken of in Boston, Mass.?

A. I will throw out Boston for the time being as somewhat uncertain, as to just what proportion of each grade of oil they use, and take the absolutely unassailed testimony regarding Lowell and Lynn on the 28-degree gravity oil and the 29-degree gravity oil, and I can say on that basis alone, and the price also at Fall River, that the excess in New York was over a cent a gallon in the period covered by Exhibit 93 and over 1½ cents in the period covered by Exhibit 94, or by the new contracts above what it should be——

Mr. MATHEWSON: Well——

The WITNESS: Above what it is in eastern Massachusetts, I will not say what it should be.

Q. That, in other words, would be a reduction of 1 cent a gallon down to 3.08 cents?

A. Yes, that is a conservative statement, that with the prices prevailing in eastern Massachusetts there would be a reduction of 1 cent a gallon or nearly 4 cents per thousand feet of gas made.

Q. That would reduce the cost from 15.89 to 12 cents per thousand feet of gas made?

A. Yes.

Q. Should that be any higher in Exhibit 94 when distributed over all the gas made by the company?

Mr. MATHEWSON: Objected to as calling for a conclusion, and a non-expert opinion on that exhibit.

3496 The MASTER: I will let him answer it.

Mr. MATHEWSON: Exception.

A. No, because there was no need of changing the contract, as judged by the experience of the Standard and New Amsterdam.

Mr. MATHEWSON: I move to strike that out, that there was no need to change the contract.

The MASTER: Strike it out.

Mr. BURR: Exception.

Q. This reduction which you claim should be made of 1 cent per gallon in the way you have spoken of would mean a reduction in the gas made by the company of how much?

A. $415,049.07 and on the gas bought from the companies with which the Consolidated Gas Company has agency agreement, $135,000, a total of about $550,000.

Q. For the 12 months ending October 31st, 1905?

A. Yes.

Q. Now, on pages 3167 and 3168 it appears that the allowance you made for differences in the price of coke at the Central Union as compared with the Consolidated amounted to $27,464.48, and that this, divided by the total coal gas made at 14th and 42d Street stations, 2,809,586,000 feet, would yield .98 cents per thousand feet instead of 1.01 cents, and it was suggested by Mr. Mathewson that the error of .03 cents was made by the blunder of dividing the number of dollars into the number of feet, and then making a mistake in pointing off the decimals. Although the error is so insignificant, yet so much was made of it that I would like to ask if you have discovered how the mistake was originally made?

A. I have. I have discovered my original computation, and find that I used for my divisor not the number of feet of gas
3497 made at the two stations, but the number of feet of gas sold,
to wit: 2,724,736,502 feet—the figures for gas sold appear in the parallel column to that containing the number of feet of gas made, and by an oversight was taken.

Q. On page 3169 your attention was called to the fact that in your table 8, page 2984, you compared the operating cost of the Central Union with the 14th Street station, after deducting in both cases not only oil but repairs, under the theory that you desired to compare on the same basis with the same degree of illumination and with the same expenditure for repairs. Your attention was called by Mr. Mathewson to the fact that the Central Union coal gas, by reason of its better machinery, might require more repairs than the 14th Street station—by reason of its add-tional machinery might require more repairs than the 14th Street station. What have you to say as to that?

A. I would say that, other things being equal, there might be required one-half cent per thousand feet more repairs in the Central Union than at the 14th and 42d Street stations on account of its additional machinery. As I would rather err, if at all, on the conservative side, I will concede the difference of a cent on this account, as contrasted with the average of the other two stations. But I could not concede that the Central Union in the long run would require 2.24 cents more repairs than the 42d Street, and 1.09 cents more repairs than the 14th Street, on account of any improved or labor-saving machinery at the Central Union plant. In fact, the difference between the 1 cent and the 1.09 at 14th Street is very slight, anyway. It was only in the case of the 42d Street that there was any great difference.

It is impossible to determine the question of repairs of any coal gas plant on the basis of a fiscal year.

3498 Mr. Mathewson: Well, that is what you argue, but on your direct testimony and on your cross-examination you give that. I do not think there is anything in addition here.

The Witness: I am through. I practically concede the repairs of 14th Street as proper for the Central Union.

Q. In view of this situation, you think it is only fair to add the one cent you have spoken of?

A. Yes.

Q. That would be to cover the possibility that in the long run the operating expenses would be that much higher on account of improved machinery at the Central Union?

A. Yes.

Q. I call your attention to pages 3170 and 3171, where, at Mr. Mathewson's request, you there made certain computations of the value of coke used by the Central Union Company. Do you desire to modify or change in any way the answers you gave as they there appear?

A. Yes.

Q. Please do so.

A. First, it was not proper, it seems to me, to include the coke used in making coal gas and amounting to $2,226.05, on the first line——

Q. That is the figure appearing on the top line of page 3171?

A. Yes, I think so. It should not be done either in the case of the Central Union or the Consolidated.

Mr. Mathewson: You understand that that is an item used for distributing holders, not for making gas?

The Witness: I don't know what it is used for.

Q. Well, it is for distributing holders, if that makes any difference in your view.

The Witness: It is a very small matter, anyway, because
3499 the point at issue is the quantity of coke that can be sold or
used in making water gas, and I thought this was used under
the retorts, but, as I say, it is a small matter. Second, it clouds the

issue to attempt to find the value of even the coke produced for sale per thousand feet, for that mixes up two issues that must be kept entirely distinct. One is the price obtainable for the coke per unit of quantity and the other equally important point, the quantity of coke that can be and is produced for sale by the Central Union, as compared with the inferior plants producing less coke for sale at the 14th and 42d Street stations.

Q. For sale?

A. Yes, or for use in water gas, either.

Q. What is this difference in the coke produced for sale per ton of coal carbonized?

A. The Central Union plant, according to Exhibit 22 of the complaint on appeal in the Central Union, pages 210, 212 and 215, produced for sale or for use in the water gas plant 83,167,560 pounds of coke, to which I see should be added even more now on account of this used in the distributing stations—and used 63,599 tons of gas coal in the retorts. In other words, the coal gas plant of the Central Union produced for sale 1,308 pounds of coke per ton of coal carbonized; really, it is more I now find. On the other hand, the 14th and 42d Street plants, according to City Exhibit 56, if we reduce the tons to pounds by multiplying by 2,240, produced for sale only 257,100,457 pounds of coke as a result of carbonizing 234,586.73 tons of coal. Thus the Consolidated produced for sale only 1,091 pounds of coke per ton of gas coal carbonized, instead of over 1,308 in the case of the Central Union. Put in another form, the Central Union produced 124 pounds of coke or really more now, I find, for sale per thousand feet of gas made, while the 14th and 42d
3500 Street stations produced only 97.3 pounds of coke per thousand feet of gas made. The 97.3 is obtained by reckoning the coal gas made at 14th Street as 1,360,284 and at 42d Street, 1,280,813 feet. In other words, the water gas made at 21st Street and piped over to 14th Street, before mixture with the coal gas, is omitted with a view to making the comparison as fair as possible for the Consolidated. It thus appears that the yield of coke for sale per ton of coal was about 20 per cent. greater in the case of the Central Union than of the Consolidated and per thousand feet of gas made it was 27 per cent. greater. This strikingly confirms the testimony of Mr. George E. Wood, quoted in my testimony at pages 3002 and 3003 as to the greater yield of coke for sale in the Central Union plant.

Q. On page 3175, you made another computation on certain assumptions of Mr. Mathewson as to the price of coke of the Consolidated Gas Company compared with the Central Union, reaching the result, on his suppositions, of $4.29 per ton for the Central Union and $2.73 for the Consolidated.

The **Master**: $4.285.

Mr. **Burr**: Yes, $4.285.

Q. Now, what have you found further as to that computation?

A. I have found that the assumptions under which the computations were made were faulty in two respects. First, the period of comparison was not the same. The figures for the Central Union are for the twelve months ending October 31, 1905, and for the

Consolidated they are for the calendar year 1905. But I find a second and greater criticism in the fact that the figures given me for the computation were the net price of coke at the Consolidated Company's plant after deducting all expenses of cartage, while
3501 at the Central Union the figures were the gross valuation of
the company before any deduction for cartage. I will make this clear.

Exhibit 94 and State Exhibit J, page 414-a, give the value of the total coke produced for sale as $388,300.91, and Exhibit 94 shows that after deducting the labor and handling, to wit: $35,678.39 and the cartage, $11,164.97, there was left as the net value or real return to the Consolidated Company $291,457.55. The figure given me for computation on page 3174 of $290,232.48 is shown in State Exhibit K, page 414-b, as the gross price of coal actually sold to consumers aside from the water gas plant and without any deduction for cartage. On the other hand, Exhibit 22 of Complainant's papers on appeal in the Central Union case shows that while 60,012,510 pounds of coke were sold for $114,663.76, as given in the computation on page 3175, there was also 23,155,050 pounds transferred to the water gas plant, and there was an expense of coke cartage, presumably borne in chief measure by the coke sold, of $20,935.91, and this, of course, should be taken from the gross price in the Central Union, if it is deducted in the case of the Consolidated, in any comparison between the two works. Therefore, all the conclusions based on the computation made by me for Mr. Mathewson on pages 3171-7 are based on false premises.

Q. In the light, however, of the additional information, which you state was given you by Exhibit 22 which you saw for the first time, as you have stated, on cross-examination by Mr. Mathewson, what do you believe would be a fair statement to make as to the difference in the price of coke as bearing on the cost in comparing the coal gas plant of the Central Union with the coal gas plant of the Consolidated?

A. The Central Union gas plant produced for sale 23,155,-
3502 050 pounds used in the water gas plant, and 60,012,510
pounds actually sold for $114,663.76, or 19 cents per 100 pounds, less cartage of $20,935.91, or 3.5 cents per 100 pounds, leaving a net price of 15.5 cents per 100 pounds. The coke transferred to the water gas was valued at $37,281.56, or 16.1 cents per 100 pounds. Since a little cost of cartage was doubtless connected with that transfer, the price that the Central Union netted for its coke actually sold was practically the same as the value that it credited itself with per 100 pounds for the coke transferred to the water gas plant. If, then, we combine the entire coke produced for sale by the coal gas plant, omitting the two or three thousand dollars' worth which my attention was just called to, which I did not understand, and which will not materially affect this, we find that it was 83,167,650 pounds valued at $152,045.32 or 18.3 cents per 100 pounds. From this should be deducted the $20,935.91, the expense for cartage or 2.5 cents per 100 pounds, and this divided over the entire amount leaves a net return on coke to the coal gas plant of the Central Union of 15.8 cents. Turning now to the Consolidated Gas Company, City

Exhibit 56, pages 1231-9 and multiplying the number of tons of coke sold by 2,240 to reduce it to pounds, we find that the two stations produced for sale 257,100,457 pounds, and we find that, after deducting the labor of handling and cartage the coal gas plant was credited with $143,706.08 at 14th Street and $150,765.49 at 42d Street, or a total of 249,471.57. If, however, this coke had been sold at a net price of 15.8 cents per 100 pounds, as at the Central Union coal gas plant—really, I think it would have been a little less if I had known of this other point mentioned this morning—the return would have been $204,721.71 at 14th Street and 3503 $201,506.88 at 42d Street or a total of $460,228.58. This is $111,757.02 more than was actually received by the 14th Street and 42d Street coal gas plants or 3.98 cents per thousand feet of gas made. In other words, 3.98 cents of the 11.60 superiority of the Central Union over the 14th and 42d Street stations is accounted for by the difference in the price of coke, and possibly one cent could be deducted from the difference on account of the essential difference in the repairs or a total of about five cents. I am not sure, however, that with the proper energy in pushing the sale of coke, there would be the above difference, or that there is really in the long run such a difference, but that I leave for the time being for the purposes of computation. There was apparently such a difference in the year ending October 31st, 1905.

Q. I call attention to your testimony on page 3185 regarding the Astoria plant and the possible economies which might be realized at that plant sufficient to earn interest upon it, and your testimony in that regard as questioned by Mr. Mathewson. Do you wish to modify your testimony in that respect, and if so, please state?

A. I meant this, that if the Consolidated Gas Company did as well as the New Amsterdam, the Standard and the Central Union, and paid a fair price for oil, it would have profits enough to bring its plants entirely up to date, if they are not up to date now. I find that the Consolidated Gas Company on the basis of last year's and the present year's consumption of gas does not use the Astoria plant. Whether that plant is to justify its existence in the future, I do not attempt to say. The Consolidated Company ought to be producing gas at about fifty cents per thousand feet without any larger capital investment than is necessary to bring its existing plants up to 3504 date if they are not up to date now. I do not hold that it is necessary to go to Astoria in order to do as well as the New Amsterdam, Standard and Central Union are doing, barring perhaps the slight difference in coke, nor do I hold it is necessary to go to Astoria in order to get a reasonable price for oil. All I mean is that if the company contends that it cannot secure as good a plant and reasonable price for oil as it should while making its gas on the Island, it certainly should be able to do so after completing its first two units at Astoria. It could then run the Astoria plant at, say, 80 per cent. of its capacity or 32,000,000 feet per day, thus making over 11,500,000,000 for the year, and relying upon the best of its water gas stations to supplement the supply in the winter months as is done in Boston and more or less using oil to mix with coal gas throughout the year to bring up the candle power as at 14th Street and 42d Street now.

Astoria seems unnecessary to take care of the present output on an economical basis, although some improvements would doubtless be necessary at 14th and 42d Streets in order to reach the economies of the Central Union. Such an improvement should have been provided for in a depreciation fund, if it has not been in the years past. The burden should not be on the present users of gas.

Mr. Mathewson: Your addresses seem to be all written out there. It seems to me that if the questions could be put and you would answer them directly, we would get more point and less argument.

Q. I call your attention to the testimony on pages 3189-3190 where reference was made to the item of public lamps and
3505 you were asked, I think by Mr. Mathewson, whether the manner of placing these public lamps or the item for public lamps as appears in Exhibit 94, was not in accordance with the procedure as adopted in Massachusetts?

A. Both the Massachusetts Gas Commission and the New York Gas Commission in its schedule recently sent out to be filled out by the various gas companies of the State, called in one place for all the expenditures by items including street lamps and on another page called for all the gross earnings from operation, including the earnings from residuals and from street lamps, gas stoves, etc. This is similar to the returns made out by the Consolidated Gas Company and is a convenient bookkeeping account, but the important point is that when it comes to a question as to the cost of gas per thousand feet, the Massachusetts Gas Commission in its hearings, in several of which I have taken part, has acted as did the New York State Gas Commission in the New York case, and deducted the receipts from residuals, street lamps, rent of stoves and other sources in order to determine the net cost of gas. The only controversy in the present case on this issue seems to be in connection with street lamps, and I would state that the most famous compendium of gas statistics in the world, known as "Field's Analysis," in reaching the total income, deducts the public lamp charges, as will be noticed on page 3 in Field's Analysis for the year 1905.

Q. On page 3195 you and Mr. Mathewson had some amiable discussion as to the propriety of allowing interest upon taxes deferred. Have you anything further to say in modification or extension of your testimony as given there?

A. No. Further thought confirms the position I then took.

Q. Which was?

A. That in any quasi public corporation, any expenses in
3506 fighting taxes imposed by public authorities so far as the expense exceeds reasonable attorneys' fees, should not be paid by the consumer but by the stockholders, if it cares to assume that risk.

By Mr. Mathewson:

Q. And if any saving is made, of course, that should go into the pockets of stockholders, and not go to reduce the price of gas; is that right?

A. Possibly.

Q. Well, do you think that is right?

A. Well, I should say that in Massachusetts is six per cent.——

Q. Oh, well——

The Master: Your turn will come a little later on that, Mr. Mathewson.

By Mr. Burr:

Q. Your attention was called, Professor Bemis, and the claim was made, I think, that you were incorrect or wrong in your deductions by which you only allowed seven cents in New York for distribution expenses aside from taxes and repairs instead of 9.45 cents actually claimed by the company, and your attention was specifically drawn to the City of Chicago, where it was claimed the accountants found the expenses to be only 5.73 cents, and you were asked to give your information as to whether they included the full cost of collecting bills, or whether they were not paid at the offices of express companies.

Mr. Mathewson: I asked him whether he knew and he said he did not. That was the whole of that. It was a subject which he himself brought up.

3507 Q. What have you to say on that point?

A. I have been informed on what I think good authority that the bills are repaid at the various offices and shops of the company. A little more with regard to the 7 cents. The New York Consolidated Gas Company sells 2,000,000,000 more feet of gas than the People's Company of Chicago——

Mr. Mathewson: That is all in evidence. This matter was brought out and the comparison made by the witness and the 7 cents assigned to New York as against 9.45, and then I asked him at length what he knew of one thing and another, and whether he knew what the cost of this, that and the other was and he said he did not. I object to going into any further argument on the point. It already appears that the output of the People's Company is about 11,000,000,000 feet in Chicago, and the Consolidated Company here is about 13,000,000,000 and a little over. That is all testified to certainly once.

Q. Have you any further reasons to add to what you gave, Professor, in justification of your allowance of the 7 cents as against the claims of the company for the 9.45 cents?

A. Yes.

Q. If so, please state them.

Mr. Mathewson: I object to that as not proper redirect-examination.

The Master: I think that is so, Mr. Burr.

Mr. Burr: I think he is entitled to show all his reasons for that allowance and if there is any reason that he has heretofore given, or if all the reasons are heretofore given are questioned by very vigorous and rigid cross-examination, I think he is entitled 3508 to give all the reasons possible to justify such a claim as made by the Professor, for the information of the Court.

The Master: The only question, Mr. Burr, is whether it is evidence or not. What you say may be doubtless correct as a general proposition, that on a fair and liberal basis of redirect-examination he would be entitled to state additional reasons for matters as to which he has been cross-examined. But if it is that the witness is to be allowed to make a general statement into which he may interject hearsay and private letters and things of that character, counsel will no doubt object to it. If you can bring out by some specific question what you want to get at, let us hear it.

Q. In your direct-examination you gave only one reason for allowing 7 cents instead of 9.45 cents for distribution expenses in New York, and that was that the expense was still lower in Chicago, being only 5.73 cents.

The Master: At page 3200?

Mr. Kirby: And 3201.

Mr. Mathewson: I asked him at that time what he had in mind which induced him to allow us only 7 cents. I asked him if there was anything further or something of that sort, and he said it was upon the rate in Chicago that he established this. Now, that went to the reasons for his making that 7 cent rate in New York. Now he proceeds to bolster it up by something that he has thought up since, which was not the foundation for his 7 cent figure at that time, and it does not go to the point. It is all *ex post facto.*

Mr. Burr: And you stated that they should be lower than
3509 5.73 cents in New York because the company not only sells
three times as much gas per mile of main as does the People's Company, but sells two billion additional feet of gas, from which the general salaries and legal expenses can be properly distributed and gave those as your reasons. I now ask you if you had other reasons upon which you based your judgment of that allowance of 7 cents as against the higher rate claimed by the company.

Mr. Mathewson: Same objection.

A. Yes. I have many reasons which I can bring in now. I had them in the office. My theory of the relation of increased distribution and decreased cost per thousand feet was not based solely on Chicago.

Q. But you based your claim on the experience as you find it in the other companies?

A. Yes.

Q. Will you give us the experience of these other companies as you find it?

Mr. Mathewson: I object to going into this subject again. The witness evidently has a long writing there before him that he proposes to read. I do not think it is proper to bring that in.

The Master: It does not seem so to me, as he stated that he had given all he could on that subject at that time that he could. I will sustain the objection, that is, unless what you intend to show is something that has been developed by the examination of the accountants here.

Mr. Burr: I will take an exception and ask him to proceed.

A. I have been familiar with the information on the sub-
3510 ject for many years, and I will now only quote two things along that line. If we divided the several largest Massachusetts gas companies next to Boston into two groups, the smallest three, Fall River, Lawrence and Springfield, with average sales of 330,000,000 feet in the year just closed, June 30, 1906, had distribution expenses aside from taxes and repairs of 12.51 cents per thousand feet, while the four larger companies, Lowell, Cambridge, Worcester and Lynn, with average sales of 456,000,000 feet, had an average cost of only 8.77 cents, showing the tendency of increasing consumption to reduce the operating cost of distribution. Another reason is the English experience. I take as my authority the Gas World Analysis of Accounts of Gas Undertakings for 1904-'5——

Mr. Mathewson: Just a minute. The seven Massachusetts companies are those to which attention has been called. The witness in his direct-examination proceeded to argue that the distribution cost to New York was larger than it should be and presented comparisons with all the cities that he saw fit at that time to support that argument. Now he proposes to bring in other statistics as to other cities and proposes to go over that fully. When we covered the cities he introduced on the direct fully on my cross-examination, it does not seem to me proper to introduce these additional cities and arguments at this time and compel us to go over that argument further. As far as the Massachusetts cities are concerned, he has referred to them, and more than that, I want to add this, that the situation in England as to wages, labor salaries and everything is so different from this country that without going into great detail in regard to that, it is perfectly idle to deduce comparisons.

3511 Mr. Burr: You called attention to that situation before, including the fogs. You said on page 3200 that may well be, there are other companies whose expenses are above ours, are there not? and he said yes, but I think there is no company as advantageously situated as yours in this country for low distribution cost. It is elaborating upon that statement that I ask for details.

The Master: There is nothing to be determined here. The testimony was objected to and the objection sustained and Mr. Burr is putting it on the record over objection.

Q. Will you proceed?

A. I refer to the account of the Gas World Analysis of Accounts of Gas Undertakings for 1904-'5, which is accepted as un-oubted authority, and I have to use it because it covers a much larger range of companies than Field's Analysis. I find according to its last returns of last June, the seven private companies whose average sales amounted to between one billion and two billion feet had an expense of distribution aside from repairs, and taxes of 6.19 cents per thousand feet, while the five companies next larger, having between two billion and four billion feet of sales had operating expenses of 4.67 cents, and the next largest company, and the one most nearly resembling New York, to wit: the South Metropolitan of London, had sales of 12,142,000 feet and had distribution expenses of only 4.42 cents per thousand feet, if we omit the expense for profit sharing and

supreannuation expenses, which in the case of the Consolidated *amount to .11 cents. This experience confirms my statement that* distribution expenses tend to decline with increase of sales. If distri-
bution expenses are only 4.42 cents in London and in Chicago
3512 5.73 cents, I do not think they should exceed seven cents in
New York. I may add that the five English companies having sales of over two billion feet and under four billion feet, and an average expense of only 4.67 are the Brentford and Commercial companies of London, Bristol, Newcastle and Sheffield, while the seven smaller companies were Brighton, Dublin, Plymouth, Portsmouth, and the South Suburban, Tottenham and West Ham of London. I have not quoted any figures from municipal plants, as I thought the comparison would be fairer with private companies, and I have taken all of them and not made any selection. I should state that in allowing the Consolidated seven cents instead of 9.45 cents for distribution expenses, which it will be noticed is 50 per cent. larger than the London company, I have been considering what should be their normal distribution expense. It may be that the accountants will find that on account of the unusual and heavy expenses attendant upon these various investigations as to price and litigation over taxes the expenses of the Consolidated for the current year are higher than seven cents. Of course I do not undertake to say——

Mr. Mathewson: Why not say right off, if you are going to argue from it, else it is of no value.

The Witness: It is important to consider what is normal and not what was extraordinary last year for the price is now being fixed for a period of several years, and my testimony applies to what is normal.

Q. On page 3207 and subsequently you were asked by Mr. Mathewson many questions all tending to lessen the force of your conclusions on distribution expenses, by calling your attention to
the fact or alleged fact that the reported expenses of the
3513 Ogden Company in Chicago were not as great as the reported
expenses of the People's, although the latter did not have as great a sale of gas per mile of main. Have you anything you desire to say upon that subject further?

A. Yes. On page 35 of the official typewritten testimony of my statements to the Chicago City Council, which I have had the opportunity of reading since my cross-examination, I find I made this statement:

"Q. The Ogden Company has some advantages in distribution from a denser territory and some disadvantages from being a much smaller company so that those expenses that relate to office and legal expenses would be much larger per thousand feet of gas sold, while other expenses like repairs of mains and meters might be smaller." In other words, the Ogden Company proves nothing either way. It is a combination of large sales and dense consumption which brings down cost of distribution. Each is a force acting in that direction, but when a company is smaller than another with which it is compared, and at the same time has a denser consumption the two forces may neutralize each other. In the Chicago testimony, pages 47 and 48 I tried to make clear, as follows:

Q. The Ogden Company has nearly doubled the density of consumption? A. Yes.

"Q. And from that should be cheaper in distribution? A. Not necessarily.

"Q. No. A. Not necessarily, for it only sells about a billion feet, while the People's Company sells in the neighborhood of eleven billion feet. That may not be exact, but very near. Now, the fact that the one company sells eleven times as much as the other 3514 enables the salary account and the legal account and many offices expenses to be divided over a large amount of gas. Salary account for general offices, such as for superintendents, engineers, &c., would not naturally be eleven times as great in the People's as in the Ogden, so that while it is true that the Ogden Company has an advantage in the one point of maintenance of street mains and meters, it has a disadvantage in the other parts of distribution cost, and I take the figure of distribution cost of the People's Company as proving that point, because in the distribution cost of the People's Company there is included apparently, a larger amount for depreciation, or repairs or renewals than in the case of the Ogden Company, and yet they only reach 21.71 cents——

Q. The Ogden Company is a new company, is it not?

A. "It is a new company, as the president told me, and has not reached its full rate of repairs. There are other reasons for maintaining that the larger the company the smaller the expense of distribution, and that has been confirmed by subsequent information from Chicago which has been so often quoted from the accountants."

Recess until 2.10 p. m.

3515 After Recess.

Edward W. Bemis resumes the stand.

Redirect examination continued by Mr. Burr:

Q. You were asked on cross-examination about the apparently much larger distribution expenses of Boston than the small cities in the State. Have you a word further to say on that subject?

A. Boston is an exception to the general rule. The experience of New England shows that.

By Mr. Mathewson:

Q. Perhaps New York may be the same, Professor. How do you know?

A. Well, if you wish me to reply now I will say that the accountants' examination will determine that fact of course finally, after making allowance for any expenses last year that were extraordinary and unusual in character.

Q. In New York?

A. Yes.

By Mr. **Burr**:

Q. In confirmation of your statement as to the price of the low gravity oil in Lowell, have you any direct information from the companies themselves in addition to the information as contained in the return to the Board of Gas & Electric Light Commissioners of Massachusetts?

A. I have the letter before me dated October 10th, from A. C. Pease, the superintendent, showing the oil used.

Mr. **Mathewson**: Just a minute. The professor has quoted here various sources of information which are not subject to our cross-examination at all, the informants not being here, and it does 3516 not seem to me that the letter will add anything to what the Professor has already said.

Mr. **Burr**: Well, he may state that he has the letter which is in confirmation of that statement, as to the price of the oil.

The **Witness**: It is in confirmation of my statement that the gravity test Beaume was 29. The return to the Gas Commission which I have before me shows the price of 3.13 cents a gallon.

Q. I call your attention to the question asked you at the bottom of page 3227, as follows:

"In other words, it would appear from this, would it not, that certain cities of sufficient size to have what you might call a wholesale output and were not of sufficient size to be subjected to these metropolitan exactions, might have and do have a smaller cost of distribution per thousand feet than a greater metropolitan city which has a larger output."

And a little further on you said:

"But as to Boston as compared with the other Massachusetts cities, I said I was not prepared at the present time to analyze the difference in the cost of distribution."

And again you say:

"I answered that in some cases that was true."

Now have you anything further to say upon that subject in explanation of your testimony or in amplification of it?

A. I will say, in addition to what I have already stated 3517 to-day, that exceptional differences in Boston were brought out in my testimony before the Massachusetts Gas Commission in the hearings on the reduction of price in 1904 and 1905. I there showed that the distribution expenses in Boston, particularly the management expenses, were higher than in other cities in the State and due in part to the fact that Boston was just emerging from a condition where there were seven gas companies with more or less distinct and separate office expenses. This had been partly but not fully remedied at the time of my testimony in the Boston case. The condition was very much as it must have been in New York in 1884 at the time of the Consolidation.

Q. And the data that you have already quoted from Great Britain, Massachusetts and elsewhere shows that is the general tendency, doesn't it?

A. No.

Mr. MATHEWSON: It shows it if it shows it. If it does not the witness's say so does not make it so.

Q. When being examined by Mr. Mathewson regarding the physical conditions of Boston and Chicago, and their comparison with the conditions which he claims exist in New York you were asked about Philadelphia——

Mr. MATHEWSON: No, I didn't ask him anything about Philadelphia. I didn't mention it.

The WITNESS: That is a question you asked Mr. Burr. I thought it was a question he asked.

Q. Well, as a matter of fact, so far as physical conditions in Philadelphia are concerned the streets are wider and less congested than New York?

A. Yes.

3518 Q. And while on the subject of possibility of the Consolidated Gas Company purchasing increased amount from the subsidiary companies you were asked (pages 3237-8):

"And if the company were manufacturing, or as soon as it commenced to manufacture its own gas entirely, there would be additional repairs and renewals due to this three billion feet or such a matter which is now procured from other companies?"

You did not answer that question fully. Have you anything to say further in amplification of your answer there?

Mr. MATHEWSON: Look at the top of page 3238. I think he answered it exactly——"A. If it stops buying from them. Q. If it manufactures its own gas? A. Yes."

Mr. BURR: I say, has he anything further to add in amplification or explanation of that?

A. I will state that I have lately ascertained from exhibits of these several companies with which the Consolidated has Agency Agreements, exhibits which were not accessible when I testified before the State Gas Commission, that the average cost of repairs at the works of these companies is about one and one-third cents per thousand feet. An increase, therefore, of one and one-third cents per thousand feet on about 3,000,000 feet sold to the Consolidated, if divided over the ten billion feet now made by the Consolidated would not increase the repair account one-half cent per thousand feet. The repair and renewal account together might amount to one-half to two-thirds of a cent, but that is divided over the entire output.

3519 Q. And while you are on that subject and along on the same page, after the testimony I have just called your attention to, you were asked if you should not also take into account the fact that repairs and renewals at Astoria would be greater per thousand feet than in the water gas plants of the Consolidated, and therefore that you should take that into account in considering the proper cost of gas. What have you to say as to that?

A. Repairs and renewals are certainly greater in a coal gas plant than in a water gas plant, but the total operating cost in an up-to-date coal gas plant in New York properly situated might be considerably less than those of a water gas plant, as seems to be the evidence by the Central Union——

Q. You were asked at the bottom of page 3239 with regard to taking three per cent. and applying it to the Consolidated Gas Company's depreciable property, and what would be the result?

A. That and a proper amount for repairs would not exceed 10.89 cents during the last twenty years.

Q. Well, you were asked if you applied that three per cent. depreciation on the property of the Consolidated as the new Massachusetts law required when approved by the Gas Commission in the case of municipal plants, whether that would not mean at least 4½ cents per thousand feet for depreciation and renewals in New York?

A. It very likely would. The actual renewals of twenty years in New York were 3.73 cents according to the exhibit prepared by the company, but the 7.16 cents for repairs which was the other item in the 10.89 cents is rather larger than was testified to by either Mr. Cowdery in Chicago or Mr. Humphreys in Holyoke. So an ordinary allowance simply for repairs or repairs and depreciation together, I think, would still be within the 10.89 cents in New York City. That is under the conditions existing here. And, further, in Massachusetts, the Gas Commission does not always insist upon three per
3520 cent. They can do that if necessary.

Q. You were asked at the bottom of page 3247 whether you did not take thirty-three years in your estimate before the Gas Commission as your estimate of the average life, as contradistinguished from the forty years of Doctor Humphreys?

A. I have discovered on page 41 of the typewritten copy of my testimony before the Chicago City Council that I there assumed in my testimony that Mr. Humphreys had somewhere held that thirty-three years was the average life. I stated to the Chicago Council as follows:——

Mr. Mathewson: My question was whether before the Gas Commission here the witness did not assume a thirty-three year period?

Mr. Burr: Do you remember the testimony which you quoted from the Gas Commission referred to some statement he had previously made to the Chicago City Council, so he is going to the source of this statement—and it may be a misstatement—to contradict or explain it.

Mr. Mathewson: The simple question was whether before the Gas Commission, at page 3247 of this record here the witness did not assume a thirty-three-year life for a plant. What he said in Chicago I did not inquire or care about.

Mr. Burr: He said in answer to your question he did not remember. Now he gives the facts.

I stated to the Chicago City Council "thirty-three years is less than the average life of a plant," but in order to be conservative I later stated that I would take thirty-three years in Chicago and im-
3521 mediately afterwards used the same figure in New York.

Q. You still say that a gas works, predominatingly a water gas works, has a longer life than thirty-three years?

A. Yes.

Q. And as the testimony shows here, the mains being subject to practically no deterioration, you would say their average life was what?

A. Nearer fifty, of the whole plant.

Q. I call your attention to page 3255, where you were asked at the top of the page whether a sinking fund to meet depreciation would be set aside in towns owning lighting plants in Massachusetts——

Mr. MATHEWSON: I do not see that on that page.

Mr. BURR: It is put in this way.

"Q. You put it in this way. Don't you know that the towns themselves would not consent to the establishment of a sinking fund of the character that you advocate, and therefore the terms of the present law and the treatment of the accounts by the Commission? A. I don't think there has been a sinking fund except for the debt."

Have you anything in addition to say to that answer now, in explanation of it or in amplification of it?

A. I would say that a sinking fund to retire the debt within the probable life of the extension for which the debt is incurred is the improved method of financing in the English municipal plants as the Board of Trade and the Local Government Board of England hold, although they have in addition frequently a further expenditure for renewals as they go along.

3522 Mr. MATHEWSON: I don't think that that subject was discussed. It was simply a question of whether a sinking fund to take care of final renewals was provided and the Professor said he didn't know of any such expenditure.

The WITNESS: Well, now I do know that that is the way they financed most of their indebtedness for extensions in Great Britain. That is, if a municipal gas works in Glasgow wishes to borrow one million dollars for holders, they go to the Local Government Board, and the Local Government Board through its engineers has fixed upon a probable life of holders and they allow them to issue those bonds but they must create a sinking fund to retire the debt at the time the holders will have to be "scrapped."

By Mr. MATHEWSON:

Q. That is for additional holders?

A. The same is true of mains.

Q. Isn't it for additional holders and mains and so forth?

A. Any addition to the plant.

Mr. MATHEWSON: That is another proposition entirely.

The WITNESS: It is the form for many years in which they have financed their extensions. And that takes care of depreciation on those extensions, is my point.

By Mr. BURR:

Q. Now your attention was called on page 3256 to the statement of Mr. Cowdery of Chicago, that he had known a fifteen-cent variation in the cost in a single year of gas within the vicinity, the question being:

"Q. And do you remember the testimony of Mr. Cowdery
3523 of the Laclede Gas Company, of St. Louis, that he had known
as much as fifteen cents variation in the cost in a single year of gas within the vicinity? A. He used some figure like that. I don't remember exactly. In the coal famine, which I thought he referred to when I heard him say it, there was of course quite a change in the price of coal and also in the demand for gas."

Now, do you desire to qualify your statement or add to it in that connection?

A. I find that the greatest change in the total cost of gas for the entire sixty-nine gas companies of Massachusetts during the last six years was during the coal famine. That is probably the most extreme case that has occurred. The average operating cost at the burner in Massachusetts distributed over gas actually sold to consumers rose five cents, from 64.6 cents in 1901-2 to 69.6, two years after that, in 1903-4; but the sales increased so fast that the actual profits increased 8.36 cents, which is above the rise of five cents in cost; while the next year, 1904-5, three of the five cents increase of expense disappeared again. The general tendency of cost during the last twenty years in Massachusetts gas statistics has been downward. I may say that in getting the divisor to use for determining the changes in the cost of gas in Massachusetts I have taken the sales to consumers and not the total sales which include sales of one company to another.

Q. On page 3277 you were asked:

"Q. Well, what did you find the cost at the station was of the gas that this company manufactured itself at Boston," referring
3524 to the Boston Consolidated Gas Company, and you stated
"42.05." And you were asked this question: "That is very much in excess of the cost at the station of the Consolidated Gas Company's gas, isn't it? A. Yes, they make it under very much greater difficulties than you do. They have to mix it by 'fits and starts'."

Do you wish to qualify your statement or add to it in that connection?

A. The latest information I have for Boston is for the year 1903-4, when I found that was true to an enormous extent. Even the large Bay State Water Gas Plant only made during that year, during two months of that year, six per cent. of the average monthly make, and some of the plants were shut down entirely part of the year, only making during the winter months in order to supplement the coke ovens. Gas manufactured under those difficulties is of course much more expensive than where they manufacture continuously. But even with that handicap if I take what the Bay State water gas plant made, 1903-4, and apply to it the four cents average price of oil in Boston last year and the New York City Consolidated price for anthracite coal, and the Bay State operating even under those difficulties would have had less than thirty cents cost at the holder, even though it was making so irregularly.

Q. So then the Boston Company has an average cost at the holder of 31.85 of gas made and bought and about 42 cents for that which it directly makes, is that it?

A. Yes, what it buys costs it 23 and the average of the whole is 31.85 cents, or about the same as in New York.

3525 Q. What do you find the fact to be? Is the price at the holder about the same as to the Consolidated, as to sales?

A. It is about the same. And now I am on that, I would like to add one more point on that Boston Company. The company sells 20 per cent. of what it buys, ten per cent. of the total sales to other companies. Its average price of sales to other companies and to consumers was eighty-six cents last year and this year will be under eighty cents because of the fact that to the private consumers it sells for eighty-five cents and its price to the other companies is thirty-six cents. It sold 432,000,000 feet at thirty-six cents last year, which it obtained from coke oven plants.

Q. Are you speaking of cost to the consumer at the burner now?

A. Yes. Price. That is for the year ending June 30th, 1906, the year just closed. My figure of the current year of under eighty cents is based on the assumed sales being just the same as last year. Of course they will probably be greater.

Q. On page 3279 you were asked regarding the fact as claimed by Mr. Mathewson that the mines that supplied coal to the coke oven plant at Everett were owned by the owners of the Boston Company, and you said:

"I believe to the best of my knowledge there are other mines in Nova Scotia situated near it of about the same quality, but the price obtained in Boston for that coal I am ignorant of."

Do you wish to add further to your statement in that connection?

3526 A. It appears that I was wrong in assuming or believing as I did then, that the same people owned the gas interests in Boston and Everett that owned the mine in Nova Scotia, because I have discovered from Moody's Manual for 1906 that not a single director or officer of the Boston Consolidated Gas Company or of the so-called Massachusetts Gas Companies which controlled both the Boston Gas Companies and the Everett plants called the New England Gas & Coke Company, is the same as any of the officers or directors of the Dominion Coal Company. All of their names and many of them are given, are different.

Q. That is the company which has a contract for supplying coal to the coke oven plants at Everett, is it?

A. Yes. Most of the directors of the Dominion Coal Company appear to be Canadians, residents of Canada; and most of the directors of the Boston Gas Company appear to be residents of Massachusetts, according to Moody's Manual.

Q. Your attention was called on page 3284 to a statement of an alleged difference made at some period some years ago in which you were stated to have said that ninety cents was a proper figure in Chicago. This testimony was quoted on that page:

"Q. But, Professor, at the time you delivered this testimony, then, that you thought ninety cents was a proper figure in Chicago, you say it was only a guess, and you have no data to proceed upon? A. I didn't say I had none, but I don't think I had accurate data of the cost of oil and coal."

3527 Do you desire to amplify your testimony in that regard? A. I would like to quote *verbatim* my testimony before the Chicago City Council, to which reference has been made in this examination here (pages 206-7 of my testimony that day).

Mr. MATHEWSON: Before the Chicago City Council in 1897?

The WITNESS: Testimony with reference to it in 1905.

Mr. MATHEWSON: I have not asked you about your testimony before the Chicago City Council, have I, in reference to this subject? I asked you whether in 1897, at Springfield, before a legislative committee, I think, you did not testify in favor of 90 cents as a fair price of gas in Chicago. Now you are going to tell what you testified to before the City Council a year or two ago. I do not care about that.

The WITNESS: With reference to the same subject.

Mr. BURR: You spent some time in bringing out what he said, on pages 3283-4-5, as to the apparent inconsistency between his statements now and then. That you claimed in that year he said 90 cents was a fair and reasonable rate for Chicago.

Mr. MATHEWSON: If you read the testimony you will find you are mistaken. I asked whether in 1897 he did not testify in Springfield—that was Springfield, Illinois—that 90 cents was a fair basis for gas in the City of Chicago, and he said he did, but it was more or less of a guess. Now you ask what he testified as to this before the Chicago City Council a year or two ago.

3528 Mr. BURR: I call attention to page 3283, where, in order to show that he did so testify in Chicago, you read from testimony before the New York Gas Commission and stated as follows:

"I read from page 1336 as follows:"—

The MASTER: I have it before me.

Mr. MATHEWSON: That is before the Gas Commission.

Mr. BURR: Well, this has reference to the subject I have immediately in mind. I will continue reading it (page 3283):

"Q. Now, in 1897, you testified in Chicago, if I am correct in my assumption, that 90 cents was a fair price for gas in the city of Chicago?"

3529 By his answer it is quite evident he didn't see what you would mean to have him say. He answered,

"A. I don't—that was brought up in a hearing in Chicago the other day. I don't know what it referred to, as I didn't give any testimony in 1897, and I never gave testimony in the Chicago Gas case—Oh, I thought—yes, it was a hearing in Springfield, not in Chicago."

Mr. MATHEWSON:

"Q. But relative to Chicago?" The inquiry I made of the witness was in reference to his testimony in 1897. Have you got his testimony of 1897?

The WITNESS: No.

Mr. MATHEWSON: Of course you haven't got it.

Mr. **Burr**: Why do you say "of course"?

Mr. **Mathewson**: Because he just said he hadn't it to you.

Q. Have you found a verbatim report of your testimony on the subject taken before the Chicago City Council?

A. In 1905, yes.

Q. Will you tell us just how this question of 90 cents being a reasonable rate for Chicago was first raised, so far as you are concerned?

A. The first I know anything about it was during my testimony in 1905 before the Chicago City Council.

Q. Under what circumstances was that testimony taken?

A. I was speaking before the Chicago City Council or before a committee of the Council with respect to a reasonable price for gas in 1905, and the attorney of the People's Company and Mr. Sullivan, president of the Ogden Company, asked me if I had not stated in Springfield, Illinois, before a committee of the State Legis-
3530 lature in 1897 that at that time 90 cents was a reasonable price. And I was going to show how, when this was first mentioned to me, how I answered it before the Chicago City Council Committee.

Q. Now do you desire to explain under what circumstances and conditions you said in 1897 at Springfield, Illinois, if you did so, that 90 cents was a reasonable price in your estimation for Chicago?

A. I do not believe I said it but I had come to the conclusion that I must have said it because it came to me in this examination two or three times, and I was inclined to assume that they knew I said it but I cannot remember and do not now believe I said it.

Q. And you so stated, did you not?

The **Master**: That all appears on page 3285. What he has just been saying he stated there.

The **Witness**: I have a confirmation of it in the testimony I gave in Chicago and that is why I wanted to read a sentence.

Mr. **Mathewson**: I don't think that confirms anything. I didn't ask about that.

Q. At all events in 1897, was that the time of the consolidation in Chicago?

A. I think it was, but I am not absolutely positive. There was some legislations connected with a new Gas Act then, I think. Just what I do not remember.

Q. You have been asked at this hearing about your previous testimony in Chicago with respect to the price of oil there and also with respect to the price of oil in Cleveland. Have you anything further to add in that connection or do you desire to modify your answers in that connection?

A. I will quote what I said in Chicago.

3531 "By Mr. **Meagher**:

"Q. And did you agree with me that the oil would cost 14 cents?" That refers to per thousand feet. "A. I took your suggestion that oil was 3 cents a gallon and on that basis I worked out a result. I didn't know what the oil was. You were my only authority.

"Mr. **Meagher**: Yes, that is right."

Page 198 of my testimony.

Again, with respect to Cleveland, page 91 of my testimony before the Chicago City Council:

"Q. Is coal and oil about the same price also in Cleveland as here? A. I think he said a little cheaper there. I don't know the exact figures either there or here but the vice-president and treasurer of the company told me the other day that they were paying 4 cents for gas oil there. I could hardly understand it because if they are, they are paying as much apparently as is being paid here, which Mr. Meagher said was 3 cents per gallon, although I did not know exactly."

I merely quoted to show I did not claim to be positive even in Chicago.

The **Master**: Does this refer to pages 3293 and 3294?

Mr. **Mathewson**: The Master will remember I merely asked the witness whether that was not his best information. He said yes, I do not see that this modifies that at all. On page 3293 that is a quotation from the Professor's statement to the Chicago City Council.

3532 Q. You have been asked regarding the comparison between Chicago and New York as gas making centers and the conditions that prevail in each city, and you have given some statements in that connection. Have you anything further to add in that regard as to what constitutes any difference or distinction between the two cities in the manufacture and distribution of gas?

A. I merely wish to bring out in one sentence the fact as I understand it: there is a more stringent effort here to prevent the use of soft coal than in Chicago, thereby forcing upon the people the choice of a more expensive fuel or gas for furnace use and household heat. In fact all through the West there is more leniency in allowing soft coal than in New York City. This, I think, tends, other things being equal, to furnish a better market both for gas and for coke.

Q. On the top of page 3323 you said something about the return of the Laclede Gas Works being four and one-half per cent. on a legitimate capitalization. What did you mean exactly by that?

A. Well, I don't think I apprehended the question and don't think my answer was appropriate. I don't think my answer was based on an understanding of the question. Of course the present dividends, I believe they were five per cent. on the stock, and interest of five per cent. on the bonds would become much more than five rather than less if the capitalization were reduced, and the premium on the said securities would proportionately rise, I believe. Whereas I seem to state that it would be 4½ per cent. on a legitimate capitalization, by which I meant a small capitalization, so my statement was not an accurate answer; it was made without much understanding of what the question was; I believed it was purely a mathematical statement that would reduce the capitalization and keep some earnings, and the earnings would be a larger percentage on the same capitalization, of course.

3533 —. Calling your attention to page 3328 and to the questions asked you there with regard to the Massachusetts companies and about the dividends in Massachusetts, have you anything to add to what you said there?

A. I have to add that the dividends during the fiscal year of 1904-5 of all the Massachusetts companies were $1,864,701.50, which was 6.71 per cent. of the capitalization, of the stock, of $27,783,404.

Q. I will ask you while on this subject of dividends, have you, in view of your cross-examination by Mr. Mathewson upon the subject, obtained any additional data regarding the Massachusetts companies?

A. I have simply noted the fact that I already had in mind in a general way, that the Massachusetts Gas Commission has frequently ordered reductions in price which the companies have accepted, although at the time of said order the company had only been paying six per cent. dividends.

Q. Have you any special instances in mind in that connection?

A. Yes, I have taken all instances in the last five years. Springfield is the first in date. The Gas Commission ordered a reduction to take place November 1st, 1900, in Springfield from $1.25 to $1.00. The dividend was only six per cent. in the previous year and at the time the reduction was ordered. The next year, 1901-1, the Gas Commission ordered a reduction in East Boston from $1.40 to $1.25. The dividend was nine per cent. before the reduction. The same year in Waltham where the dividend was six per cent. the Commission ordered a reduction from $1.50 to $1.25. In Newton the same year, where the dividends were eight per cent., the Commission ordered a reduction from $1.40 to $1.30. In the next year, the fiscal year, 1901-2, Chicopee was paying no dividend and the Commission permitted an increase in price from $1.40 to $1.50. 3534
In 1903-4 Chelsea was paying six per cent. and the Commission ordered a reduction from $1.25 to $1.10—these are all net prices. The same year East Boston was paying six per cent. dividend and the Commission ordered a reduction from $1.27 to $1.00. The same year Newburyport was paying six per cent. dividends and the Commission ordered a reduction from $1.50 to $1.40. And during the year 1904-5 Charlestown was paying ten per cent. and a reduction was ordered from $1.01 to $0.90. In all these cases the reductions were noted in the report as having been accepted by the company and the price reduced accordingly.

Mr. Mathewson: I do not see that that has the remotest bearing on any examination of mine.

Mr. Burr: Well, you examined with regard to dividends in the Massachusetts companies.

Mr. Mathewson: No, not on that at all.

Q. On page 3349, after a lengthy conversation between you and Mr. Mathewson with regard to the probable buying out of a company by another company and what should be allowed for depreciation, &c., and a distinction being drawn as to whether it was going out of business or was a going concern, you said in the midlde of the page:

"But I answer positively that if a new company bought the old one out as a going concern it would not have the right to capitalize any of the price it paid for the old company, but only could continue to earn on the original structural assets. That was tried in Haverhill and the Massachusetts Gas Commission ruled it out.

"Q. And that is still at issue and the courts have not decided it yet? A. Yes."

3535 Have you any further information on that, and do you desire to add anything?

A. I desire to correct a statement I made there. As I understand the Haverhill case, the issue was not the right to capitalize any sale over and above the physical or structural value, but the question was a more radical one than that. It was a question whether a company had the right to capitalize the structural value if it had been created out of the consumer, that is, if it had not been a stock subscription by the stockholders, but where the stockholders had been receiving regular dividends and the company had used surplus earnings from the sale of gas to build up the plant, until it had become worth even in structural value, a great deal more than the stockholders had put into it, then the Gas Commission ruled that they could not capitalize that surplus; so that it was a very much more advanced position than I intended in my statement. That case has not yet, I think, been decided. It is still in the Courts, and, of course, it has a very direct bearing on the present case, because even all——

Mr. Mathewson: Just a moment. I move to strike that out.
The Master: Strike it out.
Mr. Burr: Exception.

Q. Has that situation any bearing upon this case in your view?

Mr. Mathewson: I think it was excluded, was it not?
Mr. Burr: I have just asked the question.
Mr. Mathewson: Objected to as purely a conclusion.
The Master: Objection sustained.
Mr. Burr: I except. You may answer, Professor.

3536 A. It is the same princip*al* as is involved in the capitalization for all the increase in the value of the proper*l*y since its construction, for all the property since 1884 of the Consolidated Gas Company, as I understand it, there has been very little increase of stock for the purpose. I believe there has been $1,300,000 and odd in bonds, but I believe most of the increase since 1884 according to the testimony in the case as I recall it, has not come from the sale of securities, while dividends have been paid regularly.

Q. You were cross-examined, Professor, quite minutely by Mr. Mathewson, on the question of whether the company was entitled to a return on the two million dollars due from consumers, page 3357.

Mr. Mathewson: My proposition was that the Company was entitled to a return on its working capital whether in the shape of cash or any other shape up to a reasonable figure, which Dr. Humphreys testified was about four million dollars, and not on any special consumers' deposits or amount due from consumers.

Well, do you desire to add anything to your testimony or explain your testimony in that connection, Professor?

A. Well, I do not find any evidence that any securities were issued or any obligations contracted for which the Company is obliged to pay interest or dividends in order to have secured that two million dollars, but they are in the nature of an accumulated surplus.

Mr. Mathewson: That was all gone over in almost that exact language.

The Witness: I think so.

3537 Q. On page 3370 and on page 3375, your computations were questioned and their accuracy called into question with respect to the increase claimed by the Company in the value of their property since 1884 as compared with the increase in book value. Do you desire to add anything to your testimony or to qualify your testimony in that regard?

A. Yes. Complainant's Exhibit 79, page 347-a gave the book value as of October 31, 1905, as I believe, $39,883,984.91, while my computations of the claims of the Company now, using $4,200,000 for meters and personal property, $1,994,034.35 for services, $12,636,150 for mains, $19,115,793 for buildings, machinery and holders, and $15,651,500 for land amounts to $53,597,477.35. The difference between those two totals is $13,713,492.44, and represents, as I understand it, the claim of the company for increase of value since 1884 not accounted for by the nine and one half million or ten million dollars that they have designated as new construction. Further I find that leaving out all question of land, mains and services, there is an increase in the appraisal of buildings, machinery and holders further than is covered by the item of extensions of $3,028,364.28, personal property and meters, $397,455.50, or a total of $3,425,819.78. So that in so far as those figures are correct, and in so far as there is such a value, to say nothing of any value that may be admitted on account of growth of land and mains and services, to that extent is the 10.89 cents too high rather than too low. But I continued to use 10.89 cents.

Q. And to that extent you have given the benefit of that higher allowance to the company?

A. Yes. I recognize the duty of making a further calculation when the revised appraisals now being made are in, but this is only taking the company's testimony.

3538 Q. I understand. You stated that previously, and I so understood it. Your attention was called to the cost of duplication in Chicago on page 3377. Now let us take up the City of Chicago. Mr. Mathewson said "What was your estimate in the Chicago report to the City of Chicago as to the cost of duplication of the Chicago Gas Works. A. I think I spoke of a new plant as $3.20 per thousand feet." How do you reconcile that with the cost in this case as you claim it to be, an increase in book value since 1884 of $2.20 per thousand cubic feet?

A. The difference in the mains in the two cities will account for almost the entire difference. There are if I remember right about 795 miles, or call it 800 miles, in use in New York, and 2,000 miles in use in Chicago. In other words, 150 per cent. more in Chicago. You take the book value even of the mains here in New York, which is, I think, in the neighborhood of $7,600,000, I don't recall exactly at the moment, but about that, and 150 per cent. of that is $11,400,000, and that alone divided into the 13,300,000,000 feet of sales would make 90 cents of capitalization per thousand feet, or account for almost the entire difference. Then again, I was considering in the case of Chicago a plant that was buying its land more recently, while in New York I was considering the land as bought many years ago.

By Mr. MATHEWSON:

Q. The land is worth the $5,000,000 which you claim Yalden found it cost the original companies?

A. What the land is worth now in New York or what it ought to be worth—wait a minute, what was your question?

Q. In other words, you took land here at about $3,000,000, didn't you?

3539 A. Yes, I think so, Yalden's figures of about $20,000,000 plus about $9,000,000 and a little over increase since——

Q. Yes, about $21,000,000—$20,942,000?

A. Yes. So that I think that the difference, while I make no attempt to say that the Chicago statement was the result of any long study, for it was not and does not claim to be, yet I do not see any marked discrepancy between it and the valuation here, when account is taken of the enormously larger number of miles of mains in Chicago for the same amount of sales; in fact, for less sales, for they sell only eleven billion feet with 2,000 miles, while here they show thirteen billion feet for 795 miles. On the other hand the Consolidated Gas Company does not have manufacturing capacity sufficient to take care of all its sales, its manufacturing capacity being between ten billion and eleven billion feet a year.

Q. On page 3383 you were asked:

"Q. You made an estimate to the City of Montreal, I think quite recently as to the establishment of a plant there. Do you remember what your estimate per thousand feet of sales was for that plant? A. Not exactly. I will look at it and verify the figures.

"Q. Will you look at it and see if it was not $4.30 per thousand feet of sales?"

Will you explain how that estimate was made?

A. Yes. It was not as large per thousand feet of sales as the New York basis, if the difference in size of the plant is considered. For example, in Montreal the mains average $6,886 a mile; meters, $8.00 a piece; services, $21.65, and the coal gas manufacturing plant $200 per thousand feet capacity, the water gas plant $100 and the holders about $75.00 per thousand feet, between $75.00 and $80.00.
3540 Those figures multiplied into the New York capacity and the lengths and so forth bring out less than $1.70 per thousand feet, but there would have to be larger mains per mile than in Mon-

treal, and that merely indicates that there is no contradiction between the terms. My unit figures are lower in Montreal than Mr. Mayer took here with respect to coal gas or water gas or holders, but in Montreal I made what I thought a very liberal allowance on the cost of mains for the size required there because the city engineers and other engineers in Montreal and everybody including the officers of the gas company told me that mains had to be laid six feet deep there to protect them from freezing, while here I do not understand that they are much more than three to four feet from the top of the main to the surface of the street. They have very great difficulties from cold weather in Montreal. The present company's mains are not laid quite as deep in all cases, but they wish they were, so I was making a computation for the city based upon a new plant. And then I had this point in mind that this was a report to a city that was considering the possibility of building a plant of its own, and I thought it was just as well to be very careful, and where any possibility of doubt existed I took what I thought to be the higher prices as I did not feel that I wanted them to be led into a question—into a wild goose chase. But I do not see any inconsistency between those prices so far as magnitude is concerned and here. It must be remembered that they have to have many more miles for the same output than here. I estimated an output of only a billion feet and 250 miles of mains, while here they only have about three times as many miles of mains for about thirteen billion feet of output. But I based it on a study of the city.

3541 Q. You were asked about the capitalization of all the companies in the United States which was stated to be $8.47 per thousand cubic feet of sales according to the computations of the city statistician of Chicago. Have you anything further to say about that?

A. I will call attention to the fact that Massachusetts according to Mr. Grosser, had a capitalization of only $3.96 per thousand feet of sales, according to this computation, while, approaching it somewhat differently—I don't know just his method, I reach $4.03 as the capitalization from the Census Bulletin, which I suppose he used, United States Bulletin, No. 123, dated January 23, 1902. And I would say that the average size according to this same bulletin of the Massachusetts company was 68,727,000 feet of sales or less than the average of 877 companies in the United States which was 76,504,000 feet of sales, so one would expect the cost, or the stock and bonds per thousand feet of sales would be higher rather than lower in Massachusetts, especially when we consider that Massachusetts is among the colder States, where mains have to be buried somewhat deeper to protect them from frost and so forth. I therefore do not place much weight upon the returns for the United States, where there has been no restriction of capitalization for the last few years as there has been certainly for the last few years in Massachusetts.

Q. Your attention has been called many times by counsel for the Complainant to the report of the Committee on Gas, Oil and Electric Light to the Common Council of the City of Chicago, dated June 30, 1906, and you have been examined at some length in regard to the

statements purporting to have been made by Mr. Cowdery and others
therein, and I understood you to say that in giving your statement
as to the cost of manufacturing and distributing gas in Chicago, you
took the figures as presented in this report by Marwick, Mit-
3542 chell & Company, and their report on the People's Gaslight &
Coke Company to the Chairman of the Committee on Gas, Oil
and Electric Light of the Common Council of the City of Chicago, as
this same appears on page 40?

A. Yes, sir.

Q. In which communication dated January 22, 1906, they state: "In accordance with your instructions, we have made an examination of the accounts of the People's Gas Light & Coke Company, of Chicago, and compared the statement submitted by them as purporting to show the cost of manufacturing and distributing illuminating gas in the City of Chicago in the year 1904, with the relative vouchers and the manufacturing accounts in their ledgers. This statement was classified under several headings. We have eliminated from each heading, such items (if any) as were in our opinion erroneously charged therein. The result of our examination is summarized in the following figures:

	As stated by P. G. L. & C. Co.	As revised, M. M. & Co.	Difference.
Cost of manufacturing........	31.8193	28.2204	3.5989
Cost of distributing (including renewals)	21.7101	17.2344	4.4757
	53.5294	45.4548	8.0746

"We should have been accorded an opportunity of more fully examining several of the distributing and other accounts in the ledgers that bear directly on this investigation, but this was denied us. Had we had access to these accounts the cost of manufacturing and distributing might have been somewhat further modified.

3543 "It appears right that we should state that the figures sub-
mitted by the People's Gas Light & Coke Company include
charges for renewals which, we were informed were considered
adequate to maintain the property at a fair operating standard of
efficiency. These renewal charges were accepted by us in our re-
vision of their figures. No allowance is, however, included in either
statement for the wear and tear which is generally conceded to
occur in excess of that which is covered by renewals.

Yours truly,

MARWICK, MITCHELL & CO.,
Chartered Accountants."

This letter is addressed to Honorable Lynn H. Young, Chairman of the Committee on Gas, Oil, Electric Light of the Common Council of the City of Chicago. On page 41 appears a second letter addressed to the same Lynn H. Young as such chairman, dated Chicago, January 26th, 1906:

"DEAR SIR: Replying to your communication of even date, I wish to advise you that there is 6.0043 cents per thousand feet included in the figures for renewals and repairs, in the year 1904, and included in the figures in the distribution of gas, as shown by the People's Gas Light & Coke Company and our report.

Yours truly,

MARWICK, MITCHELL & CO.,
Chartered Accountants."

On page 3404 you asked——

Mr. MATHEWSON: Well, was there any question in connection with that?

3544 Mr. BURR: Yes, the question went before the reading. I referred in my former question to this paper and then I read it.

Mr. MATHEWSON: The witness has not answered the question, has he?

Q. You know that those two communications appeared in this book which Mr. Mathewson has referred to so often on pages 40 and 41?

A. I have read such a letter as you were reading.

By Mr. MATHEWSON:

Q. That is the same book to which Mr. Burr has called your attention in your direct-examination, is it not, as to what the accountants found in Chicago?

A. Who called my attention to it in this case first, I do not remember. Of course I knew of the book before.

By Mr. BURR:

Q. When you made your statement on your direct-examination as to what was the cost of manufacturing and distributing gas in the City of Chicago did you base such statement on this report that I have read of Marwick, Mitchell & Company or upon anything else in addition?

A. I based it upon that report.

Q. On page 3404 you were asked about the profits on the capital investments in all those cities that had reduced their price within the last ten years?

A. Yes. I have had that matter looked up since the last hearing.

Q. You have investigated that matter?

A. Yes.

Mr. MATHEWSON: Since the last hearing?

The WITNESS: Yes.

3545 Q. What do you find to be the facts?

Mr. MATHEWSON: I object to this as not proper redirect-examination, the investigations of the witness since the last hearing.

Mr. BURR: You would not let him make an investigation or give the result at the time you asked him on page 3304. Now I understand he is amplifying his testimony or explaining it in that regard. Is that so?

The Witness: Yes.

The Master: To determine what the increase in assets as mentioned in your testimony bears to the increase in sales, is that it?

The Witness: Yes.

The Master: He may answer it.

Mr. Mathewson: Exception.

A. I have found that the profits the year before reduction as given in the table to wit $1,445,750.64 were 11.94 per cent. of the stocks, bonds and notes payable, which amounted to $12,108,400. I find that the year after the reduction the profits amounted to 11.52 of the stock, bonds and notes payable then outstanding which were $12,626,800; in other words the profits fell off only .42 of 1 per cent. from 11.94 to 11.52 per cent. I find further that the sales increased 28.92 per cent., the receipts 14.48 per cent., the stocks, bonds and notes 4.28 per cent., the assets 10.8 per cent. But if you leave out Lowell and Lawrence, which made large increases, it was 7.17 per cent. increase in assets as reported in the Massachusetts gas reports, and the sales increased—I think, perhaps, I stated that increase 28.92, while the reduction in price was 10.83 per cent. In
3546 other words, the requirement of interest and dividends did not increase anywhere near as fast as the receipts, but the assets increased nearly as fast. But if you leave out Lowell and Lawrence the increase is only 7.17 per cent. One cannot know those assets very well without going into each plant individually. In Boston from 1892-3 to the year 1895-6 when the price fell from $1.35 to $1.00——

Mr. Mathewson: Did I ask you about Boston in that connection?

The Witness: Perhaps not.

Mr. Burr: I think you did. You say on page——

The Witness: The table that I have been testifying about was Table 19 giving the effect of all the reductions in price outside of Boston since June 30th, 1894 in Massachusetts. Thirty cases there were in that table. I was starting to say, that in Boston when the great reduction came from $1.35 to $1.00, it was $1.35 in 1892-3 and $1.00 in 1895-6, the sales increased 41.4 per cent. and the assets 35.9 per cent. That was a case of larger increase of assets than in the case of the Massachusetts cities outside of Boston, for it was accompanied with a duplication of mains by the Brookline company and many other features of investment that would not be necessary where there was no more competition in gas than exists now in New York City.

Q. What has been the effect on profit of price reduction in New York City?

A. I find that during the five years ending with 1895, the sales in New York at an average price of $1.25½ were 33,173,000,000 feet, and during the five years of a ten-year later period ending with December, 1905, they were 61,011,000,000 feet, or nearly double,
3547 while the assets increased only nine per cent. and the dividends double while the price fell from $1.25 the first five years to $1.00 during the second five year period, a decade later.

By Mr. MATHEWSON:

Q. Does that include all the companies, or the Consolidated Gas Company alone?

A. The Consolidated Gas Company. I have also compared the year 1897, which has been spoken of by Mr. Cowderry, as a year of great cost—no, as the year when costs were lower than they have been since, with 1905, and I find that in 1897 the price in New York was $1.22 and in 1905 it was $1.00. But I find that the sales have doubled and that the dividends doubled.

Q. What do you mean by the dividends doubled? What do you mean, in rate, or what?

A. The dividends in 1897 were $2,850,392, and they were about twice as much in 1905.

Q. And the stock was about twice as much, wasn't it?

A. The book value of the assets increased from $44,576,521.05 to $47,664,984.91. In other words, the assets increased only $3,000,000, or less than eight per cent., while the divided profits doubled, showing that the tendency has not been for the cost of gas making to rise since 1897, due regard being had to the effect of price reduction from $1.25 to $1.00, in enormously increasing sales, taking account also of the fact that there is a growth of population which also tends to increase sales.

By Mr. BURR:

Q. Have you any facts in this connection regarding Milwaukee?

A. First, let me explain about this.

Q. Well?

A. One explanation partly explaining this is further the
3548 fact that, to go back a little longer, comparing 1885 with
1905, for I have not the data for the intermediate period, I find that while it is true as brought out in some exhibits and testimony of the complainant that the sales per meter have not increased during the last twenty years, I find that the sales per service have increased from 43,660 feet in 1885 to 153,851 feet in 1905. In other words, there are actually less services in use now than there were in 1885, if I understand right the exhibits. There appears to have been according to the Rowland valuation as I have been able to compute it, for it is not exactly given in so many words, but by adding half a dozen columns at the close of the report of 1886, I discover 90,299 services in the plants that form the Consolidated Gas Company while in October, 1905, that has shrunk to 86,338 services, 4,000 services less, while the consumption had grown from about five billion feet in 1885 to over thirteen billion feet in the twenty years. The consumption per mile of main likewise had increased from 5,507,807 feet in 1885 to 16,606,461 feet in 1905. Although the consumption per meter has not increased, there are nearly four times as many meters off the same service pipe as formerly and off from the same mile of main, so there has been required very little increase of travel to overseee the mains and services in the twenty years. In fact, the number of miles of mains does

not increase largely. I have forgotten exactly, but I do not think it has increased more than 20 per cent.

Q. What has been the effect on *price* of price reduction in Syracuse?

Mr. Mathewson: Now, is this re-direct? Has any question been raised as to Syracuse either on the original examination or my cross-examination? Have I got to chase up Syracuse? 3549

The Master: How is that, Mr. Burr?

Mr. Burr: Do you decline to receive this information?

Mr. Mathewson: Yes.

Mr. Burr: Well, I do not know that the Master would refuse to take the example of a single city upon this very important question as to the bearing of the reduction of price upon consumption here in our own State quite recently. I think that we ought to give him all the information that is available, and that was not available at the time we had our direct-examination, and I would like to have you have the benefit of it now. So with that in view I would ask the Professor to let us have the facts in that regard.

Mr. Mathewson: Syracuse has not accepted the order of the Commission, which was merely an order for a reduction from one dollar to ninety-five cents, and my information is that they are not going to. I do not see how any deductions from that are going to be of value, aside from its not being redirect-examination. It is still in the Courts.

Mr. Burr: I submit that if he will give us the facts, they are very brief, and he thinks they are not applicable to this case, he may move to strike them out, and then the Master can grant the motion. But I think they are pertinent as giving a thorough understanding of this very imporant point as to the effect of reduction upon consumption.

The Master: I do not think it is re-direct, but if there has been any development as to Syracuse, which under the course pursued here would have been allowed in the first instance, I will take it now, but merely the facts with regard to it and no arguments deduced from it. 3550

A. In the Syracuse case before the Gas Commission last spring the company gave the following facts. That the net price in 1901 was $1.1776 and I have it for each year, but will read the last year, 1905, average 98.98 cents. The sales meantime increased from 229,348,300 feet to 352,806,500 feet or about 50 per cent., and the profits increased despite the fall of 19 cents from $104,379.43 to $140,759.14.

Mr. Mathewson: Gross or net?

The Witness: Net.

The Master: It does not appear but what that was entirely available when the Professor was on the stand.

The Witness: I did not happen to think of it.

Q. With respect to the 10.89 cents which you took as covering repairs, renewals and depreciation based on the average of the twenty years preceding 1905, do you find in the record in this case testimony which confirms that position which you take?

A. Yes.

Q. And if so will you please refer to it?

A. I find from Complainant's Exhibit 85 on page 458 and from the State Exhibit L, page 45, that during the last three years repairs and renewals both were only 7.7 cents per thousand feet, but I find that Mr. Bradley on page 176 of the testimony of this case was asked this question on July 15th:

"Q. Would you say that they (speaking of the holders and plants) were in better physical condition to-day than they were three years ago? A. I think so."

3551 In other words, although only 7.7 cents per thousand feet have been spent the last three years on renewals and extensions, Mr. Bradley thinks the physical condition of the holders and the plants better at the end of the time than they were in the beginning, which bears very decidedly, it seems to me, on the fact that 10.89 cents is certainly a conservative statement to take for repairs and renewals. For if they were at the end better than in the beginning there was no depreciation.

Mr. Mathewson: I suppose counsel could not have presented that argument as well as you did, having the facts before him. It is simply an argument and nothing else.

Q. In your cross-examination by Mr. Mathewson you were made to appear as taking the ground that the company was justified in capitalizing the increase of the value of its plant aside from any increase in the value of land or paving, provided it made allowance for this increase in its repairs, renewals and depreciation account. Is that your contention or is that your claim?

The Master: What page?

Mr. Burr: Well, it runs through his examination.

Mr. Mathewson: I do not quite follow that. I do not recognize the theory. Is that quite right? Cannot you point some place here in the testimony where that appears to have been suggested?

The Witness: It was the structural value.

Mr. Mathewson: That may be, but that was another thing.

Mr. Burr: That is the trend of your cross-examination as 3552 I remember it and as I recall it. Now, I do not want to leave that unexplained or leave the record with that apparently the Professor's opinion, if it is not his opinion, and I am asking him now whether he desires to add anything to that or whether that is really the position he takes.

Mr. Mathewson: I do not understand the question. I do not want to delay the proceeding, but I should like to have the question read.

(Question read by stenographer.)

Mr. Mathewson: I do not remember such a suggestion.

A. The word capitalizing may be interpreted as the right to earn dividends from such an increase in value. I have some doubts as to whether such portions of the increase as was due to surplus profits should be capitalized. In other words, I have some leaning towards the position taken by the Massachusetts Gas Commission in the Haverhill case. At the same time I have made computations on the basis of assuming that they could capitalize any increase or claim the right to earn six per cent. on increased value on any part of their property aside from land and paving, provided that they made allowance for that in fixing the repairs, renewals and depreciation percentage.

Q. You are quoted as having said in Chicago that you did not know of any new case that had been started on a six per cent. basis in the last thirty years.

A. New company, that should be.

Q. Do you wish to qualify that statement or add anything to it?

A. Well, I do not know of any new company at all in the last thirty years that has started in on the basis that I am contemplating giving to the large gas companies of this country, 3553 namely, a company starting in with the entire field for itself with a practical monopoly. The only cases that I know of are where they have started in in competition with existing plants, which is a theory I do not believe in in the gas business.

Q. Now, Mr. Mathewson examined you quite at length as to the statement made by Mr. Cowdery in this report of the Committee on Gas, Oil and Electric Light to the City Council of Chicago, and to his qualifications and expressed the opinion to which your attention was immediately directed. Did you hear Mr. Cowdery make this statement appearing on page 13 of that report with regard to the City of Milwaukee (handing book)?

A. I have read this and it is in harmony with my general remembrance of what he said at that time.

Q. Will you read it?

A. (Reading:) "I left Milwaukee in the spring of 1903, after being there for twenty-six years. While I was in Milwaukee, the price was reduced from $2.75 a thousand, to $1.00 a thousand for lighting, and 80 cents for fuel. I was known in Wisconsin as the champion of reduction in the price of gas. The price in Milwaukee for illuminating purposes has been reduced within the last year. The price is now $1.00 for the first 1,000 feet in any month, and for all additional illuminating gas used during the month, the price is 90 cents. Fuel gas is furnished at 80 cents per thousand. A reduction is made to large users. The first 10,000 feet of gas used in any month is sold at 80 cents. The next 10,000 feet is sold at 70 cents and all additional gas through the same meter during the same month is sold at 60 cents. These reductions have been entirely voluntary on the part of the company. Such reductions have been made 3554 to cultivate the larger use of gas for fuel purposes, to encourage manufacturers and others who desire to use large amounts of gas monthly. The result of such reduction has been to increase the sales of gas and to increase the profits. This has been the result in a large number of cities where reductions have been made."

Q. You have no reason to doubt that statement or those statements?

A. No.

Q. Will you explain a little more in detail, Professor, in view of your cross-examination, what is your view of a sinking fund as applied to the depreciation in this case?

A. I had at first planned to make quite a study of it, but having found that 10.89 cents would simply cover and apparently more than cover the entire amount necessary each year, and being very busy with other features of the work, I did not carry it out. But it seems to me unnecessary in a way, in view of the fact there is so much evidence of the 10.89 as it is, covering the plant, so it is worth more to-day than it was twenty years ago by fully the amount spent for extension. I do not assume that is worth any more than the excess—any more than twenty years ago except for the nine and one half million: In other words, I give them the benefit of the 10.89, assuming that the increase in capitalization has been precisely what has been claimed in the book value, and the amount spent for extensions, and the testimony seems to indicate that if anything it may have been a little more.

Q. You were asked by Mr. Matthewson, he making certain assumptions, whether the land belonging to the company, if sold,—whether its price should be divided amongst stockholders or should go to extension. I wish you would clear up your ideas or your position on that point.

3555 Mr. MATTHEWSON: You are a little in error, Mr. Burr.

The MASTER: Does it need any clearing up, did not he answer the questions on cross-examination?

Mr. BURR: I will withdraw the question.

Q. You were also asked by Mr. Mathewson regarding your testimony in the Baltimore case. Do you desire to add anything in that connection or explain anything?

A. Yes, the Baltimore case was a——

The MASTER: To what particular point is this directed, please, as to the question of the basis of the value of that property?

Q. You were asked this question on page 3384: "And in that case did you not estimate the value of the property of the Baltimore Gas Company by taking the net earnings of the company and multiplying them by twenty, and state that to be a fair basis for reaching the valuation of the entire property? A. I think I did. That is Mr. Humphrey's basis in Holyoke.

Q. And you quite approve of that basis of taking the earnings of five per cent. and multiplying by twenty in order to get the value of the property? A. The company in Baltimore had no inalienable rights to continue to earn upon that, but as long as it was earning upon that basis, the city had the right to tax it on that basis." Now, do you desire to explain your testimony in that connection or any other connection?

A. I merely desire to add that that it might not appear to be a contradiction, though at first it would seem to be that I considered that all values of *quasi* public corporations above the struct-
3556 ural value is subject to reduction at any time through reduction in rates or through taxation. Until that occurs, it has that value for purposes of either condemnation or sale, but it is a

value subject at any time to be taken away down to the value of its structural assets by either taxation or regulation of rates. But having taken that position, of course,——

The Master: That answers the question, does it not?

The Witness: I wanted to couple it with the other point of view, that there must always be conceded to the company if that is so the right to fully earn enough to keep its plant intact without depreciation in structural value and it is to be assumed that rates will not be cut if there have been no profits or dividends or anything of that kind. It is assumed that the company is an ordinarily prosperous company which should be entitled then to earn on its structural assets and keep them up.

Q. You were asked about the probability of the competition of electricity checking the growth in consumption of gas. Have you an-thing that you desire to add to your testimony in that regard?

A. There is a good deal of an opposite tendency in the fact that electricity accustoms the eye on the street and in the theatres and stores to brilliant lighting and the tendency is when one goes into a house where gas is used to turn up the gas and use more gas, so that it is by no means certain that electricity is injuring the gas business even for lighting in the long run and taking into account all phases of consumption.

Q. You believe that having light, we would exclaim with Goethe "More light."

A. Yes.

Q. Have you tabulated the data which you gave on gas stocks and bonds?

A. Yes, I have it here.

3557 Q. That is you have arranged it in a more convenient form for Mr. Mathewson's better understanding?

A. Yes.

Mr. Burr: I think you asked him if he would not do that, Mr. Mathewson?

Mr. Mathewson: I think he testified and answered all the questions I asked him. I do not think I asked him to make up a table of this kind.

Mr. Kirby: You asked him if he had one and I think he said he would prepare one.

Mr. Mathewson: It may be. I do not remember what he said. Is it proposed to put this table in as evidence.

Mr. Burr: Yes, put it in here now.

Mr. Mathewson: I will have to object to it.

The Master: Can you point me to the place where the matter was under consideration before?

The Witness: It was just before recess one day and it was then taken up in the afternoon.

The Master: Page 3317?

Mr. Kirby: Yes, that is what I have reference to.

Mr. Mathewson: I will not object to it if you desire to put it in.

Mr. Burr: Yes, that is the one. He said I hoped to present it in tabulated form. So we will put it in now in better form.

3558

TABLE 20.

Gas Stocks.

Quotations During 1906—January 1st–September 1st, and Dividends.

Company.	Quotation.	Dividends, per cent.	Return on investments, per cent.

Q. And by that statement it appears—what do you claim that statement shows?

A. It shows that the securities of gas companies net a return to the investor of less than six per cent. in almost every company of large size east of the Mississippi River.

The MASTER: That appears on the face of it I suppose.

The WITNESS: Yes, the last column brings out that fact.

Q. Now from the testimony in this case and your cross-examination have you corrected your figures in any respect as to the cost of gas in addition to the one cent in the beginning of your cross-examination that you said should be allowed or possibly might be allowed?

A. I have not, save of course as I stated in the direct after the accountants and engineers are through, there may be some modification. With that exception I have not. That is not a change now, of course.

Q. And your conclusion as to the profits of the Consolidated Gas Company on the basis of 80 cents remains the same, does it?

A. Yes. I did not give it in exactly that form, but their 3561 figure of operating cost of 58 cents, that is 57.92 cents, 58 cents, if you take my figure of 10.89 for contingencies and their figure—that is, there will be a difference between that and 80 cents of about 22 cents a thousand feet. Now, it is immaterial, as I have understood, all sides agree, from the standpoint of profits, whether lamps and miscellaneous receipts be taken out of expenses or be included in the receipts and expenses; the margin of 20 cents would remain. I do not understand that the 22 cents therefore, of margin, on an 80-cent price, would cover any disputed point except the difference of less than one cent on taxes and the question of whether 10.89 is large enough for contingencies and depreciation. I understand that the 22 cents eliminates all controversy on street lamps or rental of stoves or other miscellaneous income, so the margin is agreed to be there, whichever way you express it, as a bookkeeping expression. Now, 22 cents per thousand feet——

By Mr. Mathewson:

Q. Just a moment. That 22 cents does not eliminate the difference in taxes, which is something like one cent or a little less, nor the interest on consumers' deposits, does it?

A. I stated that it did not eliminate all of the difference on taxes, but it does eliminate part of it, because I understand some of the difference in taxes was stated to be due to taxes on outside investments. As to interest on consumers' deposits——

Q. .39 of one cent, and interest on taxes was a little over .7 of a cent or 1.1 cent for the two is not eliminated in the 22 cents, you differing with Messrs. Humphreys and Addicks, is not that right?

A. 1.1 cent?

Q. I think so for the two, I think that is right.

3562 A. What I desire is to get a difference that would not be disagreed to for the moment, without reference to my claim of lower costs. Then that would bring it up to about 59 cents. The difference between that and 80 cents would be 21 cents. The 21 cents would be six per cent. on $3.50 per thousand feet of capital or structural value, and that multiplied into the 13,300,000,000 of sales, or possibly multiplied into sales—that would include the sales to the city—I wondered whether that should not be added in this kind of a computation, but will leave it out for the moment——

Mr. Burr: Add it both ways, it if will simplify the understanding of the conclusion.

The Witness: I will take it without.

Mr. **Mathewson**: 13,300,000,000 feet includes the sales to the city and a little more, 13,280,000,000.

The **Witness**: 13,280,000,000 feet. $3.50 in that is, if I make it correctly, $46,540,500. That is, taking, if I understand it, all the contentions of the company with the exception of the 10.89 cents which they think is not large enough, but I think it takes in everything else. Now, this would allow six per cent. on $46,540,000. Now, the entire valuation in 1884 was about $31,000,000—I wish I had the exact figure, for the moment I haven't it, but it was perhaps at least $30,000,000—what was that exactly, the valuation at the time of consolidation of 1884 of all the companies.

Mr. **Mathewson**: It is about $30,190,000 structural value, exclusive of franchises of $7,781,000.

A. The $30,190,000 in November 1884 plus $9,693,565.90 of increase of structural value claimed since then, plus—this
3563 may be subject to slight correction—plus $1,000,000 for working capital, $616,470.08 for increase in supplies on hand would amount to $41,500,000. Now even if you add $2,000,000 more for money due the company from gas users——

By Mr. **Mathewson**:

Q. But that does not include the $1,000,000 of cash working capital?

A. I did include that, yes, excuse me.

Q. Did you?

A. Yes. Well, and $2,000,000 asserted by the company to be a necessary part of the working capital gives $43,500,000, leaving still a margin of $3,000,000 between that and the amount upon which the earnings would be six per cent. This, too, makes no account of the tendency of reducing prices to increase sales without a corresponding increase of expenses, and it includes no deductions for any questions of difference of price of oils or between the cost of production here and in the New Amsterdam, Standard and Central Union plants &c., and I do not mean in making this computation that I admit there should not be any allowance for all these things, I only am giving a computation to show how I understand the claims of the company—except on the 10.89,—would be covered by 80 cent gas.

By Mr. **Burr**:

Q. What do you conclude?

A. I conclude that the price of 80 cents without any increase of business would cover six per cent. on $46,500,000, while the entire valuation in 1884, plus all extensions written into the books since then, plus $1,000,000 for working capital, plus $2,000,000
3564 claimed also to be necessary working capital, because due company from consumers, plus $616,000 charged for supplies on hand, still amounts to $3,000,000 less than the $46,500,000. This takes all claims of the company for all expenses of every kind, shape and description, as I understand them, with the exception that it only concedes 10.89 to cover repairs, renewals and depreciation and

I do not hold that it is necessary with the 10.89 for the reasons I have already so often spoken of.

Q. That is against the claim made by the witnesses for the Consolidated?

A. Yes. And I asserted a moment ago that I did not, in making this computation, concede that all the claims of the company covering operating expenses were to be accepted in this case, or even if they were, during last year, that they would necessarily be taken as true on the average.

By Mr. MATHEWSON:

Q. No, they might be larger next year?

A. They might be. The assumption is that this litigation will some time end. I should add that the company's claim of an amount additional to the 10.89 cents if conceded and amounting, perhaps I have forgotten now, to five cents possibly, or possibly eight cents or nine cents, but anyway whatever it be, would be met on the other hand not only by this $3,000,000 margin I have referred to, but by the certainty that reductions in price will increase sales without a proportionate increase in operating expenses.

By Mr. BURR:

Q. Your attention has been called here towards the close of your examination to some statement made by Mr. De Ford who is 3565 claimed to have been an associate of Mr. Shearn's in the prosecution of the complaint before the Gas Commission. Do you know anything about this statement that has been referred to, as appears in the minutes of the hearing before the Senate Finance Committee at the Capitol?

The MASTER: That was excluded, wasn't it, Mr. Burr?

Mr. BURR: In case it should be allowed in, I want to get his explanation of it. That is one of the difficulties.

A. I have been unable as yet to get at the copy of his speech to know what it was further that he said, that is, aside from what was quoted, and I have not met him or heard from him, and therefore I cannot say anything about it.

Q. Whatever his statement was, it had no bearing upon your testimony in this case?

A. Why, no.

Q. And whatever his statement was on that occasion it has no bearing certainly upon the testimony you gave before the Gas Commission?

A. Certainly not.

Mr. BURR: Now, I move to strike out the statement purporting to have been made by Mr. De Ford, read by Mr. Mathewson from what purports to be minutes of the hearing before the Senate Finance Committee at the Capital at Albany on February 16th, 1906, and which is printed on pages 3421-3-4 of the testimony in this case.

Mr. MATHEWSON: You have your exception to the admission, haven't you?

The MASTER: That is all I can do.

Mr. **Burr**: Is the motion to strike out denied?

3566 The **Master**: No, it is granted, but it seems sort of inoperative, since according to my ruling the testimony was excluded. I cannot strike it out physically.

Mr. **Mathewson**: I take an exception if it is granted.

Mr. **Burr**: That is all I have to ask Professor Bemis.

At 4.45 P. M. adjourned to October 30th, 1906, at 10.30 A. M.

Last Exhibits:
Complainant's, 256.
State's, W.
City's, 61.

3567 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucien L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Tuesday, *October* 30, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

3568 **Edward W. Bemis** resumes the stand.

Direct-examination continued by Mr. **Burr**:

Q. Have you any corrections to make in the testimony given by you yesterday?

A. I have not yet had time to read over the testimony, except the last three or four pages, which I read first, and there may be some corrections in the printed copy which will have to be made later; but, so far as I recall the testimony as I gave it, I think there are possibly two corrections.

I testified on some previous day last week that I thought the candle-power of the gas furnished by the New England Gas & Coke Company to Boston had to be enriched before it came up to the 19.37 candle-power used in Boston, but I have since discovered that when my memory was fresh upon the subject I testified in Boston that it was enriched before it was delivered to Boston, and came into Boston at the candle-power of from 18 to somewhat over 19. And I have no later information than what I gave in the Boston testimony a year and a half ago.

The second correction: I think I stated that the total profits obtained by the Consolidated Gas Company during the first five years were about twice as great as during the five years ending in 1895, when gas was 25 cents higher. That statement I do not change, but I should have explained the figures I used. I took and intended to state—perhaps I did state—that the figures I used for the period of 1891 to 1895, inclusive, were dividends paid out, as that was the only data I had. For the last five years I didn't use the dividends because the evidence showed that the dividends were more than the earnings on the gas alone. If I had taken the dividends there would have been an increase of two and a half fold instead of two-fold. 3569 I took the net earnings reported by Mr. Teal and appearing as an exhibit in the State Gas Commission case copied from the Stevens Report for 1901 to 1904, inclusive, and for the last year which has closed I computed the earnings from Mr. Addicks' testimony, taking his figures and allowing the full ten cents for contingents which he allowed, and I merely would say now that those figures, in order that there may be no mistake about them, I gave to a typewriter this morning in the form of three or four columns, giving each year, and she was late in arriving at the office, and therefore had not quite finished copying it when I started, and when it arrives I would simply like to hand it to the stenographer and Mr. Mathewson, as part of the testimony yesterday or to-day, being merely an explanation of my statement, not any new evidence. That is all I think of now.

Q. And have you tabulated the value of the plant as appears by Yalden's report?

A. Yes. The cost of the plant as appears by his report I have, and I find that he appears to have valued the land, the cost of the land taken into the company in 1884, as $4,251,810.94, which went into the consolidation at $10,332,000. Some of that land has since been sold, I understand from the evidence. I don't know where it is now, but some of it has been sold.

Q. Have you made a concise tabulation of the value of the property as appears by his report which would save the Master, if Mr. Mathewson does not find fault with your tabulation, the trouble of wading through those figures and that report of Yalden's to ascertain?

A. I have it, but I haven't had time to have it copied. It is right here.

Mr. Burr: I will ask leave to submit that later. It will aid the Master.

3570 Mr. Mathewson: I don't believe it will, for I don't believe the Master will find it material at all to wade through that.

Mr. Burr: I say if it is material it will aid him in arriving at the proper figures.

Mr. Mathewson: Well, I would like to see what it is.

The Witness: The other statement was merely put in two columns, the Yalden statement of cost as he reported it at that time and the figures taken in the consolidation of 1884.

Recross-examination by Mr. **Mathewson**:

I ought to say to the Master and counsel that I have not yet yesterday's testimony except as Mr. Kirby handed me a copy a moment ago. I have not been able to go over Professor Bemis' redirect-examination, and I find in going over my notes for recross-examination that it may be absolutely necessary for me to have a further interval, in view of the new matter he presented, before I complete his cross-examination. I will do as well as I can this morning, as I am anxious to conclude as soon as possible. I understood that I could have some time if it was essential, but I prefer to conclude as far as I can.

Q. Professor, you were shown an exhibit referred to at page 3130 of the testimony, Exhibit 171 before the Gas Commission, showing the cost to the Consolidated Gas Company of the gas manufactured by itself as compared with the cost to the Consolidated Gas Company of the gas manufactured for it by other companies for the four months, July 1st to October 31st, 1905.

A. I have the exhibit before me, yes.

3571 Q. And as the Central Union contribution, 34.35 cents, represented 10 per cent. above cost of labor and material you divided that by 1.1 and found that the balance, 31.33, would represent the cost of labor and material to the Central Union?

A. Yes.

Mr. **Burr**: As compared to the cost of water gas to the Consolidated Gas Company.

Q. And I then asked you to compare that to the cost of the water gas of the Consolidated Gas Company and it showed a little difference?

A. 31.23, is it not?

Q. Well, whatever it is.

A. I think there was a mistake of .1; 31.23 it is.

Q. Now yesterday you assumed to compare this 31.23 with cost to the Consolidated Gas Company for those four months at the holder, which was 35.6, and stated that it showed a difference of something like this?

A. Yes.

Q. You know, do you not, that that table was made up to show the difference in cost between the gas manufactured by the Consolidated Gas Company itself and the cost to the Consolidated Gas Company of gas which was produced for it under its agreements?

A. Yes.

Q. And that that is not a comparison of station costs at all. You understand that, don't you?

A. This is not a comparison of station costs.

Mr. **Burr**: Which one do you mean?

The **Witness**: I mean that Exhibit 171, as relates to the companies from which the Consolidated Gas Company buys the gas, is station cost plus 10 per cent., while for the Consolidated it is station cost.

Q. You are entirely mistaken about that. Don't you know that labor and material does not make the entire station cost of gas?

A. Yes, that is right.

3572 Q. Then 31.23 cents would not represent the station cost of the Central Union Gas, would it?

A. I now recall there is a small difference there.

Q. Well, whatever the difference is, there is a difference?

A. That is right.

Q. And whatever the difference is could only be determined exactly by going into the figures of the Central Union station cost?

A. Yes. They are given, I think, on an exhibit which I put in as regards at least the coal gas. I don't know whether they are as regards the water gas or not in any exhibit.

Q. And if you read the testimony before the Stevens' Commission you found that the Consolidated Gas Company, in making up their station costs, had an item known as gas production, which included merely labor and material to which they added repairs and other things amounting to several cents, as I remember it, to make up their station costs, don't you?

A. I don't recall that, but I do recall that in Exhibit 93 and Exhibit 94 there is given the cost of labor and material that you speak of, and then there is added the distribution expense for—holder costs, I understand them to be largely, to make up the final figure given in those two exhibits.

Q. In other words, take Exhibit 94, and the net amount of material and labor in gas made is stated to be 29.1 cents, is it not?

A. I don't recall now.

(Paper handed witness.)

The WITNESS: Yes, net amount of labor and material, 29.1 cents.

Q. Whereas the station cost of the gas manufactured by the Consolidated Gas Company excluding the gas purchased under agency agreement, is stated to be 32.42 cents, is it not?

A. Yes.

Q. Or a difference of how much?

A. 3.32 cents.

3573 Q. Then if you take this 3.32 cents and assume *Q. Then if you take this 3.32 cents and assume* that to be a fair average, that would pretty nearly dispose of the difference, would it not, between your 31.23 cents, which was the cost of the labor and material to the Central Union, and the 35 cents which is stated in Exhibit 171 before the Gas Commission to be the station cost of the Consolidated Gas Company?

A. For those four months. It does not affect the comparison of coal gas plants for the previous year.

Q. That is another proposition entirely. I am speaking of your comparison of this table.

A. Yes. I never had the full details.

Q. But that difference would dispose of pretty nearly all the difference which you found in your comparison on the basis of Exhibit 171 before the Gas Commission, would it not?

A. As relates to those four months, without the details, which I have not for the other year.

Q. I say it would, assuming that the difference between labor and material and station cost of the gas of the Consolidated Gas Company referred to in Exhibit 171 was as great as the difference between the cost of labor and the material and the station cost of the Consolidated Gas Company gas as shown on Exhibit 94.

A. Well, it makes several assumptions. I think that probably is one, without going into it very much, because I have not the time, but it makes several assumptions. It assumes, for example, that the cost given here for the gas made by the Consolidated Gas Company of 35.6 cents during those four months was only labor and material. That is not stated in the exhibit at all, that that is only the labor and material, but, assuming that it is, there would have to be another assumption added.

3574 Q. No; let us see if you are not wrong about that. Assume the 35.6 cents represents not labor and material only, but represents the station cost, to wit, labor and material plus these other items making up station cost.

A. But what it does assume is not stated there. I say you have to assume one or the other.

Q. You assumed, when you made your computation that that represented station cost, did you not, yesterday?

A. Yes.

Q. Let us continue that assumption?

A. And I assume that as to both, but now I say I don't know, because I find there is no data on that.

Q. You did testify, did you not, that you understood that the Central Union 34.35 cents, under the terms of the agency agreement to which you referred, represented the cost of labor and material plus ten per cent. thereon?

A. Yes.

Q. And then you figured that if that were true, the cost of labor and material alone would be 34.35 cents divided by 1.1 cents, which made 31.23 cents as the cost of labor and material at the Central Union?

A. Yes.

Q. Now, if 35.6 cents is station cost for the Consolidated Gas Company, that includes items in addition to labor and material, which on the basis of Exhibit 94, would amount to 3.32 cents, does it not?

A. I don't know what it includes. I say, if you assume that, you get the result just brought out.

Q. Won't you assume it as you did assume it yesterday, and assuming your assumption yesterday to be correct——

A. I assumed yesterday that it was a comparison on the same basis. If it is not so, why, so far as my testimony on that particular exhibit is concerned, of course, the point falls.

Q. Did you not examine the record before you made this computation and made this statement, to know what this Exhibit 171 did represent?

3575 A. No, I took it very hastily. It was something you had referred to in the cross-examination, and I just looked at it for a few moments to notice those figures.

Q. Is it not fair to assume that that is the station cost, from the heading of that exhibit?

A. It says here nothing about it directly. It says Consolidated Gas Company make cost 35.6 cents.

Q. And when you assumed that to be the station cost, didn't you?

A. Yes, I did.

Q. Well, that is quite right.

A. But I say now I don't know.

Q. Then, if that is the station cost, in order to get the cost of material and labor alone, you would have to deduct the difference between the cost of material and labor and the 35.6 cents, would you not?

A. Yes, on that assumption.

Q. And the difference between the cost of labor and material and the station cost appears in Exhibit 94 to be 3.32 cents, does it not?

A. Yes.

Q. And assuming that that factor were to be a fair one to take, then deducting that from 35.6 cents it would not leave very much difference between the cost of labor and material to the Consolidated Gas Company and to the Central Union, would it?

A. No.

Q. Well, exactly——

A. But with the exception of that one exhibit, brought out on cross-examination, my main comparison was with the coal gas plant only.

Q. That is another proposition which we will take up later, and we will show that it is as exactly unfounded. We will take them one at a time, Professor. Now you spoke about London and stated that the difference between the prescribed candle power and the candle power actually furnished in London you found to be for the principal company, I think, .6 candle power, a little over a half a candle power. Do you know where the gas is examined in London? 3576

A. No.

Q. Do you know how far from the works it is examined?

A. No.

Q. Do you know how often it is examined?

A. No.

Q. Do you know what the penalty is for violations by falling below the candle power required?

A. No. All that data has been collected this summer, but I have not looked it over.

Q. Do you know whether the requirement of the law in London is that each station of each company shall be examined or whether one examination per day is all that can be had?

A. All that has been looked up, but I have not had time to look into it myself.

Q. Do you know what the penalty is over there which could induce the keeping of a candle power safely above the required candle power?

A. I understood the inspections were very honest in London.

Q. Do you know what the penalty is? That does not quite answer my question.

A. No, I do not.

Q. If there was a penalty, for instance, of only 40 shillings in case of a defect of half a candle power, it would not be so essential to keep the candle power safely above the rate fixed by law as though the penalty were a thousand dollars, would it?

A. No, although I was taking the actual candle power. I think the actual candle power is above the requirements.

Mr. Burr: And the testimony is that even before the passage of this law there was an increased candle power, before there was any penalty fixed whatsoever, just the same as it has continued to be since the penalty was fixed.

3577 Mr. Mathewson: That is almost a matter of argument.

Mr. Burr: Well, I object to the question as being incompetent, irrelevant and immaterial on that ground.

Q. When you said that the candle power was .6 of a candle above the requirement of the law in London, did you mean that it never fell below the required candle power or that that was merely an average?

A. I took simply what is given in Field's Analysis, and even at the moment I don't remember whether it was just .6 or .5. I haven't it before me.

Q. Do you remember whether it was an average or not?

Mr. Burr: I meant to have read the table with regard to these companies from Field's Analysis, showing the prescribed rate and actual rate of candle power, as the Professor alluded to it yesterday.

Q. Do you know whether that was an average candle power or not?

A. No, I suppose it is so, but I suppose that the tests show that it did not fall below the requirements.

Q. You have previously said, and it is otherwise in evidence, that the candle power of the largest London company is 14 candles. Don't you know that when you have to maintain a candle power of only 14, and with coal gas without the necessity for oil enrichment, that it is very much easier to maintain your candle power close to the average required by law than it is when you are obliged to maintain a 22 candle power by means of oil enrichment to a large degree?

A. It is easier probably to maintain 14 than 22, and yet I know that in Philadelphia the candle power does not vary half a candle between the works and the home of Mr. Walton Clark, as he has often told me. He lives seven or eight miles away. 3578

Q. That is what Mr. Walton Clark has told you, is it?

A. Yes.

Mr. Burr: Who is Walton Clark?

The Witness: The Vice President and Manager of the U. G. I.

Mr. Mathewson: I do not think that testimony is very valuable. I move to strike it out.

The Master: Strike it out.

Mr. Burr: Exception.

The Witness: That is 22 candle power there. I am under the impression that——

Q. Have you ever taken or made any tests in Philadelphia yourself for candle power?

A. I went to the testing station furnished by the U. G. I. and also the testing station at Mr. Clark's home.

Q. Have you ever made any tests in Philadelphia as to candle power?

A. No. I want to correct the assumption that it is 14 in London. While I have not read the law in regard to that, Field's Analysis, my impression is, gives it as 16.

Q. It is 14 for two and 16 for the third, is it not?

A. It is 16 for one of them.

Q. And 14 or 16 candle power you can deliver without any enrichment by the fine quality of coal you get in London, can't you?

A. I think they enrich a little.

Q. Well, practically no enrichment for 14 candle power?

A. No, not for 14.

Q. Now about the effect of severe temperature and changes of temperature such as we have in New York, is not that a very serious matter when you come to candle power, in maintaining candle power to provide for fluctuations? 3579

A. It affects it.

Q. And is not the temperature in London more even and a higher temperature on the average than it is in New York, if you know, in the winter?

A. You ask if it is colder where?

Q. If it is not more even and a higher temperature in London in the winter than it is in New York?

A. I believe it is higher in London; I don't know positively.

Q. Well, that is your impression, is it not?

A. Yes.

Q. Now, you spoke about 755 tests that you produced here with reference to the Consolidated Gas Company, did you not?

A. There were supposedly 755, substantially 755; it may have varied four or five. I think there was one station that on four or five days was not tested. There were 151 days in which there were tests, and there were five stations; that would make 755 tests, but I think one station on four or five days was not tested, so there were about 750 tests really.

Q. And you said about thirty fell below 22½ candles, if I am correct; is that right?

A. Whatever I stated I had at the time, but I have not my notes before me. What page, please?

Q. I don't know.

Mr. Kirby: Page 3483.

(Question repeated.)

The Witness: That is what is here, yes.

Q. And when you take 22½ candles, was that the average, or what was that figure?

A. No, that was in each case. There were thirty-two separate cases.

Q. Well, you spoke about an average of 22 or 22½ candles, did you not, as having been furnished by the company?

3580 A. I spoke of that for a certain period.

Q. What was the period?

A. I think that was for the year ending October 31st, 1905.

Q. Now, how many times did you find that the tests fell below the 22 candle power required by law?

A. In that period or in this period?

Q. Yes.

A. I don't remember; I did not count them up.

Q. You found that they fell below 22 candles in some cases?

A. Well it was only 20 candles prior to July 1st, as required by law.

Q. I understand, and your average is made up of a part of the period while 22 candles was required?

A. Well, this relates to the last half of 1905, under the new law?

Q. Then it is?

A. Yes.

Q. That is your testimony as to the 755 tests?

A. Yes.

Q. Now, didn't you find that in some cases, even with that average, the candle power fell below 22 candles during that period?

A. I had the data before me yesterday.

Q. Well, what is your recollection?

A. I don't recall. I think, as I recollect; I think I remember one case. I don't think I remember—it was either one test or one day, I have forgotten.

Mr. Burr: You had better refer to your notes.

The Witness: If I have them. I am not sure whether I brought them back. When I testified yesterday I did not have those notes; they were used in making up my original testimony.

Q. You cannot tell how many, then, from your data fell below 22 candles since July 1st last, can you?

3581 A. I thought my testimony went into that pretty fully, and yet what is not in the testimony on the point I am not able, I think, at the present moment to supply.

Q. If you can point it out to me in your testimony, where you have answered that question, I will relieve you. I did not recall any such testimony.

A. On the pages which are open there, there was some statement, I thought, about it. I stated here, I notice on page 3483, that there were only five days in which the average of the tests of the five stations fell below 23, and only one day in which it fell below 22.6.

Q. Yes, but you understand that the penalty does not have any relation to averages; it provides that if a single examination discloses a fall below 22 candle power that we must suffer the penalty, and we have five stations and each station is tested. Now, I would like to know whether the tests did not show that, even with the average which you have testified to, in some cases the candle power fell below the 22 candles required by law?

A. I am sorry I have not with me my tests for each day and each station, so that I cannot answer the question. But my present recollection is that there may have been one station one day. I don't remember now. I think there was.

Q. Well, you do understand that the law does not impose a penalty for an average but for a single offense, don't you, upon any test?

A. Yes. I do understand, though, that taking it month after month it was away above at every station, and then there would be——

Q. (Question repeated.)

A. Yes, that is, it has been so read.

Q. Now you have referred to the Philadelphia works. Are you not familiar with a paper just read by Chief Engineer Gartley
3582 of the Philadelphia works before the American Gas Institute
in which he stated that in winter, when the thermometer drops, he has to allow for a drop of four candles at least between the works and the testing stations?

A. I have not read the paper, but during these winter months, as well as in the summer, these stations were away above. It was only, I think, in September and October when I saw much tendency to drop in the tests.

Q. In other words, during the winter months, when the effect of cold would be felt, a margin was provided above the legal candle-power a little higher than it was in the warmer months, is not that right?

A. There was a big margin in the summer as well as in the winter months in every station and every test, and I think in September and October, or else in October and November, there were some stations that came very near the line, and in one or two cases fell below it.

Q. You have stated in the last six months of 1904 the average candle power was 21.08 candles, as I understand you?

A. Yes.

Mr. Burr: That is when the law required 20.

Q. And that the excess in 1905 jumped to 2.18 candles. Have you not got that turned about?

A. Why, I do not see in what way I have. What I meant to say was, and I think it is the same here, that the average candle power the last six months of 1905 was 24.18, and the last half of 1904 it was 21.08.

Q. Then your statement is as you desire it. Now, don't you know that in 1904, the period which you compare, the law provided for a test only once in three weeks, and provided for a penalty only if three consecutive weekly tests showed below 22 candle power?

A. No, I don't know the law at all.

Q. You did not know that that was the law?

3583 A. I found tests every week and supposed they were according to law.

Q. And you did not know that the law then was that the company could only be penalized for three consecutive weekly tests falling below 20 candles?

A. No.

Q. They would not be penalized if one week showed 17 candles and another week 15 candles and the next week 21 candles? You did not know that?

A. No, my attention was never called to that.

Q. And did you know, too, that the penalty was only $100 in case of three consecutive failures?

A. No. That law has not appeared in evidence, I do not believe.

Q. That would furnish an explanation for running so near on an average to the candle power required by law in 1904?

A. It would have a bearing on the case, certainly, but I think an analysis of the candle powers during 1905 for each day, which I might have brought with me if I supposed it would be required, would show for every station a large excess for most of the six months, barring out about two or three months.

Q. Let us take up this 34 degree gravity oil which you say was mostly used in Boston for the year ending July 31st, 1906. Have you got any data except the letter from Mr. Richards or the letters which you have quoted for the statement that it was mostly 34 degree gravity oil in Boston?

A. It is an interpretation of two statements, one that it is practically all, and the other substantially less than 34.

Q. And don't you know that oil of 28 degree Beaumé and of 34 degree Beaumé may differ very materially so far as the value in the production of gas goes?

A. Whether it is a straight oil or a mixed oil, you mean?

Q. Any way you please to put it.

3584 A. I have no reason to know that it means anything different in Boston than it does in New York. It is furnished by the same company.

Q. And you have no reason to know that it does not? Don't you know that the same company can furnish two oils of 28 degree, one of which is more expensive than the other and substantially more valuable in gas making?

A. I examined the contracts and those contracts say—I have seen the contracts of the Consolidated Gas Company——

Q. That is not the question——

A. But I have not seen any reference to any differences that you now speak of.

Q. Don't you know that some 25 degree oil Beaumé test is as good for gas making as other 28 degree oil Beaumé test, having reference simply to the test?

A. I am not sufficiently familiar to say about that.

Q. Now you stated that the New Amsterdam and Standard had used only 28 degree oil because you found that the cost of oil to them was only a little over 4 cents, and that they maintained their candle power every month, the same candle power required by the new law. Do you mean that they maintained that candle power on the average every month, or that every inspection showed the required candle power?

A. I don't remember just how I put it in my testmiony.

Q. I don't care how you put it in your testimony. I am asking you what you mean.

A. I think I meant that every test showed it; in fact I feel quite positive that that was my meaning. There was no occasion for averaging stations, because there was but one testing station for the New Amsterdam.

Q. I understand——

A. So I cannot see how I could have made any mistake on that.

Q. But you said they maintained every month the candle power required by law. Now, did you mean that the average was 3585 above the candle power required by law or that the tests showed above the candle power required by law in the case of those two companies?

Mr. Burr: His exact language was: "It is also to be noticed that, using that quality of oil, these two companies were able to maintain the average candle power every month, with the exception of one month in the case of the New Amsterdam, sufficient to comply with the new law as to candle power.

Q. Now, you have just said you thought it applied to the new test. Which is the fact?

A. I am not sure now, because when I prepared my testimony I had before me the tests, but I did not bring them down this morning, and do not remember just what I had before me then.

Q. Now, if you have read the evidence, you know, do you not, that the New Amsterdam and Standard received oil under the contract made by the Consolidated Gas Company?

A. Yes.

Q. For joint benefit?

A. I understood so.

Q. And, accordingly, the quality of the oil they received is the same as the Consolidated Gas Company's?

A. Yes. The average candle power of the New Amsterdam and Standard, which I stated as a certain amount, compared with a lower amount for the Consolidated Gas Company, was made up on the same basis. I did not take one basis for one company and another basis for another, I am sure. I think what I took in each case was the average for the month, and then added them together and divided by twelve for the year.

Q. Have you been in Massachusetts since the last session last week?

A. No.

Q. Have you examined any of the reports of the Massa- 3586 chusetts companies since?

A. Since last week?

Q. Yes.

A. None that I did not have with me at the time last week.

Q. You have access to those, I judge, in the office of the Commission, have you?

A. Some weeks ago I had some of them copied for me.

Q. By order of the Commission?

A. Yes, by the consent of the Commission.

Q. Now, you have spoken about oil in Lowell and Fall River. Do you know what the average paid for oil in Lowell is?

Mr. Burr: He says, on page 3496, 3.13 cents is the average price of oil.

The Witness: The return to the Commission is as follows for the year ending June 30, 1906——

Mr. Burr: What are you reading from?

The Witness: The return of the Lowell Gaslight Company to the Gas and Electric Light Commission for the year ending June 30, 1906. Their return is that they used 60,009 gallons of naphtha at 5.3 cents and 833,033 gallons of other oil at 3.13 cents. And then I wrote a letter to Mr. Pease, asking him with regard to the Beaume test, and he replied that——

The Master: You stated that yesterday on page 3490.

The Witness: As I stated yesterday.

Q. So that it is a fact, is it not, that 6/14 of the oil which Lowell uses costs them, not 3.13 cents, which you stated as the average, but 5.3 cents, Professor?

A. 6/14?

Q. Yes, about 6/14?

3587 A. I think not; 60,009 gallons of one kind and 833,033 of the other, or 893,042 gallons in all, of which 60,000 gallons is less than 7 per cent.

Q. Less than 7 per cent.?

A. Yes, that is right. 1/14. You said 6/14, as I understood.

Q. Yes, that is what I said, and you find it is 1/14?

A. Yes, it is less than that; it is less than seven per cent. It is six and a fraction.

Q. That is according to the report?

A. Yes.

Q. That would make an average higher than the 3.13 cents which you gave yesterday?

A. Yes, but I am talking about the 29 degree gravity oil.

Q. And that was 3.13 cents, was it not?

A. Yes.

Q. But you were comparing that with the oil used by the Consolidated Gas Company and saying there was more than a cent difference?

A. Yes, there is.

Q. The Consolidated Gas Company has to use 34 degree oil, does it not?

A. I was comparing Exhibit 93, where they used 92.6 per cent., as near as I can compute it of 28 degree gravity oil, and at that time paid 4.04 cents. Now, Lowell paid 3.13 cents for one degree higher gravity, for 29 degree gravity.

Q. But you have no information about that oil except merely that the test was 29 Beaume, have you, whether it was a good gas oil or poor gas oil of that grade, have you?

A. While I have no absolute information, gas companies like that who have been buying oil for years are supposed to know what what good gas oil is.

Q. Yes, and they might get good gas oil and pay more money for it than that, might they not, or consider that it was better to buy cheaper oil and pay less money for it?

Mr. BURR: Objected to as being purely speculative.

The MASTER: He may answer it.

Mr. BURR: Exception.

3588 A. I could work out an answer of some value, but I could not give it offhand. I should need to take their amount of water gas made and the information that Mr. Pease gave as to the candle power and divide the gas into the number of gallons of oil used and see how the consumption of oil compared with other companies, to know whether they were using an amount of oil larger than could be expected or not.

Q. Do you know what North Adams pays for oil?

A. No, I do not.

Q. Is it not more than 4 cents?

A. It is possible. I only secured——

Q. Have you no recollection that it is? You have examined all these companies, have you not, or their reports?

A. No, the seven largest companies outside of Boston are all that I sent for.

Q. Well, don't you know that Worcester pays more than 4 cents? That is one of the largest.

A. I will tell you in a moment about Worcester. Worcester, I know, is not as well situated as Boston because it has no water competition. A curious fact developed at Worcester; I believe it is the only one of the seven companies that the copyist used a blank for a previous year which did not have that page in it; and I sent again to get that page, and the reply I received was that the Worcester company did not appear to have made any return as to the price they paid for their different qualities of oil.

Q. Well, is it not your information that Worcester pays as high as 5 cents for some of its oil and more than 4 cents for the rest?

A. I worked out this scheme. I found out what the total oil was and divided it into the total return of the price paid for oil without knowing the quality of oil at all, and it averaged 4.42 cents. But Worcester is an interior city, away from the seabo-rd.

3589 Q. How about Lawrence? Does not Lawrence pay considerably more than 4 cents for its oil?

A. Lawrence pays 4.53, but I have no information, although I tried to get it, as to the gravity of their oil.

Q. Don't you know that New Bedford pays more than 4 cents, and that is on the seaboard, is it not, and subject to water competition?

A. I don't recall. I saw in Brown's Directory that Pawtucket only pays 3 cents, I think.

Q. I am asking you about New Bedford.

A. I did not get any data on that. It was not among the largest cities, and I did not write for it.

Q. I have direct information, I think, that Lowell pays more than 4 cents on the average for its oil. Are you sure about your figures?

A. Well, I have this copy here; that is as far as I probably could go at the present time. I have not had the opportunity which I have been hoping to get; I have not had the time to compare the copy with the original in the office of the Gas Commission, but I have had reason to believe that it was correct.

By Mr. Burr:

Q. Let me ask you, did you write the Lowell Gas Company with regard to what appeared to be the average price paid by them?

A. I asked them for the gravity of their oil. I found that the return showed that, including a little less than 7 per cent. of naphtha, they used 896,042 gallons of oil and that the cost of it——

By Mr. Mathewson:

Q. That is assuming that the amount of naphtha that they used is accurately stated in your report, is it not?

A. Yes, and that the price, $29,442.52, as given on page 6 of the return, or 3.3 cents, a little less than 3.3 cents on the average.

3590 Q. That is more than the 3.13 cents you gave yesterday?

A. No, I gave that for 29 degree Beaumé. When you add in the naphtha, the average obtained by dividing the oil, 893,042 gallons into the price of $29,442.52 makes the average per gallon not quite 3.3 cents.

Q. That is assuming that your copy is an accurate copy of the report, and assuming that the report states the details accurately?

A. Yes, of course.

Q. Now, you have referred to the Astoria plant again, and the cost there. Don't you know that the Consolidated Gas Company has had a great deal of difficulty in selling the coke at the price at which it has obtained, even to the extent of that produced at 14th and 42d Streets?

A. I thought the contrary.

Q. You thought the people were crying for coke?

A. They raised the price six months ago, which appeared to me to indicate that times were booming.

Q. No, they are not. We have great difficulty, you found the testimony to be before the Gas Commission to sell the coke at the prices at which we were able to sell it.

A. I thought it was all negatived by the fact that you raised the price.

Q. You don't think we would get all we could for it if it took a little work?

A. I think if you could not sell it, you would reduce the price instead of raising it.

Q. I said we had difficulty in selling it, that was my proposition.

A. I don't understand the meaning of the word in that sense.

Q. You don't understand the meaning of difficult?

A. There is difficulty in all life and business.

Q. Don't you understand from the testimony that we had difficulty in disposing of our coke at the price we obtained for it?

A. No difficulty, not in the sense you would have me understand the term.

3591 Q. Very good. What would be the effect on the coke market of a vast production of coke at Astoria, much beyond what we now produce in New York, do you think?

A. The success of the New England Gas & Coke Company in marketing its enormous supply of coke would lead me to think that it could be met, but I don't know absolutely and cannot prophesy as to the future.

Q. And you do know, don't you, that taking into consideration the longer haulage of the coke at Astoria, and the fact that there is nothing in the immediate vicinity that uses or needs coke, would add to the expense or delivering or selling coke?

A. I don't know that it would. As long as you are on the water front and can go to any docking place on the island with it, I don't know that the expense of delivering to consumers would be much greater than by carts.

Q. If you sell coke to some concern in New York, you think that it is just as cheap to put it on a lighter in Astoria, to transfer it across the river, to unload it at the dock in New York, and then have it hauled from the dock to the consumer who uses it, as it is to have the consumer take the coke direct from the plant on Manhattan Island without lightering it at all, do you?

A. No, not if the consumer on Manhattan Island happens to live comparatively near the coke producing plant, which is only at 14th Street or 42d Street. But those are the only two points on the whole island. Now, a consumer living at a distance from those points might find the cartage no more expensive from the nearest dock to his home or business, and by lighterage from Astoria to that dock, than by cartage from 14th Street or 42d Street several miles farther by cart.

3592 Q. Is it not the rehandling of coke which injures its value rather than the distance which you have to transfer it in a single conveyance, once it is in that conveyance?

A. Both factors enter.

Q. Does not that enter very largely in the case of a brittle substance like coke is liable to injury by rehandling?

A. Rehandling injures coke more than many other substances.

Q. Now, the Central Union case, to which reference has been made, I desire to read from page 147——

A. I understand, if I am at liberty—I must assume that the Astoria plant will be so situated that the coke will be delivered on lighters with far less trouble than it is now delivered at 14th and 42d Streets into carts in many cases, because it will have a thoroughly up-to-date coke handling device doubtless.

Mr. Burr: And there is no evidence on this record as to what the condition will be as to delivering coke at the time the Astoria plant commences to deliver it and have it for sale. It is dealing with the future.

Q. But once the coke is delivered into the carts of the carting company at the plant, or into the cart of the consumer, there is no handling necessary until it reaches the consumer and is dumped into his bin, is there, where the plants are located on Manhattan Island?

A. But to get it into a lighter from 14th or 42d Street, is harder. I understand they are separated by streets from that water-front.

Q. Do you think you would necessarily have to get it into a lighter from 14th or 42d Streets?

A. You asked me that question.

Q. No, I did not ask you anything of the sort.

A. I thought you said lighter or carts.

3593 Q. Let us see if we cannot get this cleared up. Where the consumers of the coke are on Manhattan Island and the plants of the company are located on Manhattan Island, the coke can then be placed into the conveyance which delivers it without transfer from the company's plant to the consumers' premises. That is clear, is it not?

A. Yes.

Q. Is not that a great advantage as compared with transferring into a lighter and lightering it across the river and re-transferring it from that lighter to the cart which takes it to the consumer.

Mr. **Burr**: That is assuming conditions which do not exist.

Mr. **Mathewson**: Will you not let me cross-examine the witness?

Mr. **Burr**: But you asked the question and the same conditions would prevail when they got to Astoria. They could put the carts on the lighter or on the boat which they use now, so there would be only one vehicle, and have it transferred from Astoria to the consumer in Manhattan, as there would be one vehicle from the plant or station in Manhattan to the consumer.

The **Master**: You can argue that at some other time. Get the facts now, if you please.

The **Witness**: I would say, as far as the handling is concerned, it would appear as if there would be less injury to the coke from a direct cartage from the plant to the consumer, but there might be much larger cost of cartage, which would offset any difference in the condition of the coke at the end of the cartage and many consumers of coke might not find the coke any worse for their purposes in one case than in the other.

Q. But coke which is not screenings, or coke which is uninjured, is more valuable in the market than screenings or injured coke, is it not?

A. Yes.

3594 Q. Now, I will read from page 147 of the Central Union case, Mr. Doane's testimony:

"Do you know whether you have customers to whom you have to transport the coke or whether they take it at the works? A. The Central Union are advantageously situated in regard to supplying coke. They have a steady trade which takes the coke as they make it. The result is that they are always able to market their coke at a price better than it is marketed down town and it is taken with such regularity that they do not have to pile it and handle it as the companies do down town."

Now you understand, do you not, that Mr. Doane who testified in regard to that is the president of the National Coke & Coal Company which handles the coke for the Consolidated Gas Company?

A. The figures which I gave confirmed the statement, that it does cost more.

Q. Did you ascertain that from your reading?

A. I think I did.

Mr. **Burr**: And also an officer of the Central Union, is he not?

Mr. **Mathewson**: No, I don't know that he is. He knows a good deal about the company.

Q. Now you have made some reference to the fact that individuals interested in the Standard Oil Company were also interested in the Consolidated Gas Company as perhaps explaining something in reference to the so-called excessive price of oil. Can you explain on that theory why the company should establish a coal gas plant at Astoria instead of a water gas plant, which would use a great deal more oil?

Mr. **Burr**: That is objectionable because it is not re-cross-
3595 examination. There was not anything brought out about that on the re-direct, and that was a statement that he made in his direct-examination, and Mr. Mathewson cross-examined him as fully as he might or desired.

Mr. **Mathewson**: And it was a statement which he knows he should not have made.

The **Master**: I do not think that is important, Mr. Mathewson.

Q. I read further from the Central Union case in reference to the coke.

"By Senator **Page**:

"Q. Why is it you have so much better market for coke in the Bronx than they would have in Manhattan? A. I think there are two or three reasons. One is, they do not produce as large an amount and they have a large territory to supply and there is a large amount of building going on.

"Q. When you say they, whom do you mean? A. The Central Union. We are testifying now in regard to the Central Union. There is a large amount of building going on in that Bronx district, an exceptionally large amount, and it is customary for building contractors to use coke in portable boilers, &c., and I am under the impression also that they get domestic trade among smaller houses, one family and two family houses, which they do not get down town among families who live in apartments. Those are the reasons I have in my mind for the ready sale they have for their coke."

A. I took that all into account, and the figures I used, if accurate, as I believed they were when I used them, would still *have* a
3596 large margin to be accounted for.

Q. We will account for it before we get through with your cross-examination, Professor.

A. All right. All I have are the exhibits.

Q. Have you any official documents showing how the Massachusetts Gas Commission treat the cost of gas as distinguished from the form of report which they require from the companies?

A. No, except that in the hearings it has been customary to bring in evidence showing the net cost which they have accepted as bearing on the case with great——

Q. And in reaching the net profits, they deduct the residuals and receipts from gas sold and so forth, do they?

A. Certainly.

Q. Well, now, in the matter of residuals, the residual is a necessary and inherent thing, isn't it, in the manufacture of gas and delivery to the burner? You cannot get rid of it? It must be?

A. Certainly.

Q. So it is a necessary part of the operating cost of gas. On the other hand, when you come to the returns from gas stoves or the returns from rentals, that is something which may or may not exist in the manufacture and distribution of gas?

A. That is right.

Q. So that there is a very clear distinction between the two, is there not?

A. But if you are going to put your capital in gas stoves you must put in your returns from them?

Q. I agree with you perfectly, but you must also contemplate the proposition that the Company may go out of the renting of gas stoves some day and have no return of that character to apply.

A. Well, then, it would disappear from the record and the capitalization of the stoves would disappear if they sold them. If they stop renting stoves you mean they would sell the stoves, I suppose?

3597 Q. Well, you might assume that. Now I asked you yesterday or was about to ask you when it was suggested my time had not come, what the result would be if you made a saving in taxes by reason of these contests; whether that would be applied to reduce the cost of gas or not. Taking that in conection with your statement that you think if interest accrued on taxes that were unsuccessfully contested, it should come out of the dividends to stockholders?

Mr. Burr: Isn't that purely and simply a matter of argument?

The Master: No, I think it is proper cross-examination.

A. I think in the long run those savings will go to the stockholder, if the price of gas is only fixed occasionally and during all the intermediate years it is not changed, with changes in taxes.

Q. You know that taxes are not fixed occasionally, but fixed annually in New York?

A. Yes, certainly.

Q. And you do know from experience that if a tax fixed this year on the plant or property of the company is not contested, that the tendency is to maintain that tax for the future?

A. Yes.

Q. So that the action of the company in contesting a tax which it considers improper affects in substance not only the present but the future?

A. Yes.

Q. Don't you think in that connection that if a company prudently sees fit to contest a tax, upon the advice of counsel, and are unsuccessful, that they ought to be allowed to charge the interest that they pay on that tax to the cost of gas, provided if they are successful they charge into the cost of gas in future years only the amount of the reduced tax?

3598 A. But I don't understand that there is any provision under the decisions of the State of New York, under which this is automatic, so that if the Commission, for example, fixed the price this year on the basis of cost of interest of $94,000 and next year that did not exist that the price of gas would be reduced by the equivalent of $94,000. I do not understand there is any such automatic provision of the State law. Therefore when we are fixing the price of gas now for the future and any $94,000 at the best is only a temporary expense for one year.

Q. Isn't it your observation from examination of the records here that the taxes of the company have been constantly increasing?

A. Yes, but I have had no record that there has been an annual interest of $94,000 on back taxes. This is only one year.

Q. You have not examined the previous years to see though, have you?

A. We have the year 1904 before us, I think, in the State testimony.

Q. Did you observe whether interest was included there?

A. I do not remember there, but in Mr. Teal's report which went back to 1900 I do not recall.

Q. I think it was in each year, Professor?

A. As high as $94,000?

Q. Oh, I don't know what the amount was, but the principle——

Mr. **Burr**: You mean the Consolidated has always contested its taxes.

Mr. **Mathewson**: I do not. I mean that wherever it has done so the interest, if it has had to pay a tax——

Mr. **Burr**: You say that is the principle which has existed for a series of years, if I understand you correctly?

3599 Mr. **Mathewson**: I am afraid you do not understand very correctly. I do not think we need this colloquy on the record.

Mr. **Burr**: Yes. When you say to him you believe such and such condition of affairs has existed I thought you meant to have it go into the record.

Mr. **Mathewson**: I have no objection to what I said going in the record. That is to say, that wherever the company has had to pay a penalty upon the payment of a tax which it has under the advice of counsel protested and contested that that penalty has been charged in the operating cost of gas and, in our judgment, ought to be.

Mr. **Burr**: You were speaking of this $94,000 being an exceptional case and you referred him back to the previous years to show the same principle was adopted and acted upon.

Mr. MATHEWSON: I think it will be seen it is adopted and acted on.

Q. You referred yesterday to the cost of distribution in London, in Engand, in some of the largest companies. What did you include in the 4.02 cents for the South Metropolitan?

A. I included all distribution expenses outside of repairs and taxes, superannuation and profit sharing.

Q. What year?

A. I took most of the companies from here, from the Gas World Analysis of Accounts of Gas Undertaking, 1905, but for London, I think I did use Field's Analysis for 1905.

Q. Now, will you tell me what elements entered into this 4.02 cents for the South Metropolitan which you stated to be the distribution expense?

A. I think I will have to work it out over again, because I don't
think I have those notes with me, therefore I will have to
3600 follow Field's analysis. South Metropolitan, on page 4, oc-
curs salaries and wages for the South Metropolitan .65 of a
penny. Then come repairs, which I said I did not include. The next item I find is directors and auditors, on page 5, .10 of a penny; salaries, .13; commission to collectors, .49; stationery and general charges, .42 of a penny; law and parliamentary, .15; bad debts, .06; public offices and testing stations, .01. That, I think, makes up the amount, because I said I omitted superannuation, profit sharing. That is 2.01 of a penny, if I computed right, which multiplied by two, you get 4.02 cents. I omitted in my original computation the .01 for testing stations on the ground that was in the nature of a tax, and I said I omitted taxes, so in my testimony it was two pennies exactly, and multiplied by two made four cents.

Q. Why did you leave out repairs?

A. I stated I was trying to compare an item analogous to your 9.45 cents, which was leaving out repairs in that case, too.

Q. Why did you leave out superannuation?

A. I stated in my testimony that that and profit sharing amounted to .11 of a cent in your company and it would have been fair to have carried that statement one step further and say that therefore the four cents which I finally got in London would be compared, not with 9.45 cents but with 9.34 cents.

Q. No, let us turn it around the other way——

A. And then again, there is another reason. Most of the superannuation and profit sharing, as I found on visiting the plant, concerns itself with the manufacturing portion of the plant, and not with the distribution portion.

Q. The profit sharing is not based on any particular portion of the plant, is it?

A. No, but most of the men who get the profits and most
3601 of the men who get the superannuation benefits are in the
manufacturing portion of the plant.

Q. Now, as a matter of fact, when you take an item like profit sharing, it means the employees received a certain figure, and they also receive a certain contingent figure for compensation?

A. Yes, they share in the profits.

Q. Then it is really labor as much as though it was not called profit sharing—isn't it compensation, anything you please to call it of that sort?

A. Some think it is.

Q. Well, don't you think it is?

A. Well, the other companies have not adopted it; they do not think it is an advantage.

Q. Well, it may not be an advantage, but as a matter of fact, it is a payment for labor, isn't it?

Mr. BURR: No, it is in addition to their labor. How can it be a payment for labor when it is an addition?

Q. Isn't it a payment for labor?

A. It is an addition to wages based on the profits of the company and given by the company for two purposes, as we learned over there, as near as I could gather, at least: Partly to encourage the men not going into Unions, and partly to encourage zeal.

Q. In other words, what the company pays is a certain fixed wage plus a certain additional wage which is contingent, which is what is included in the item profit-sharing, isn't it?

A. Yes. In a way. But even if you look—it is not fully that, but so far as it is it mostly relates to efforts to keep not the clerks and inspectors out of Unions, but to keep the men in the manufacturing portion of the plant out of Unions, and those are the men who get most of the benefit.

3602 Q. However that may be, it is not a return on capital, but it is an expenditure in the operation of the plant in one branch or another, isn't it?

A. In the manufacturing branch it might be considered, but only a portion of it in the distribution branch.

Q. Wherever you distribute it it is an expenditure in the operating cost of the gas, isn't it?

A. Yes.

Q. And not a return upon capital?

A. Oh, yes. That's right, but I say in the distribution expense. I was not trying to find the profit of that company.

Q. Whatever part of that then would apply to distribution would be charged to distribution expense?

A. Yes, whatever would be added would be added, but even if you add that——

Q. Well, no matter about that——

A. The 1.08 is the entire amount paid out for superannuation and profit sharing of the South Metropolitan, which would be 2.16 cents, but starting on the basis of my personal knowledge on that subject not one-quarter of it goes to distribution, is a distribution expense. The rest is a manufacturing expense.

Q. This 1.08 pence is more than half as much as the total distribution expense, 2.01, which you figured up a moment ago, isn't it, so it is a very substantial item?

A. But it is applied on the whole system.

Q. I understand, but won't you answer my questions? It is a very substantial item, isn't it, when compared with the distribution items which you previously mentioned amounting to 2.01 pence?

A. Yes.

Q. Now don't you know as a matter of fact, a superannuation charge largely goes into the distributing branch of the plant, as much as 95 per cent. of it?

A. No, I don't know that that percentage goes into it.

Q. Don't you know that it does in the Consolidated Gas Company?

A. I don't know. Their expenses for the whole thing is
3603 small and I don't know anything about their statistics, and
it has never been given.

Q. You have no knowledge that any different proportion went into any plant than went into the Consolidated plant in the distribution branch, have you?

A. I think so, yes. I would suppose that long continued existence of profit-sharing and the facts I learned about the long time the men had worked as stokers in the South Metropolitan Company lead me to suppose that a very considerably more than half of the superannuation must go to the works and not to the distribution system.

Q. That is your assumption and you don't know anything about it by analysis, do you, or direct information as to the distribution?

A. The actual percentage I don't know, but I know that a large amount of information was given us, indicating the great number of men at the works that got this profit sharing and superannuation.

Q. Will you look, Professor, at page 4 of Field's Analysis for 1905 to which you have referred and say what under the English practice are included in distribution charges, so-called?

A. Salaries and wages, wear and tear. That means not of the manufacturing plants. That is provided for elsewhere. Meter repairs, stove repairs, public lamps, rents payable, rents and taxes, directors and auditors, salaries of management—oh, there is a separation between distribution and management. I was reading it all as distribution because sometimes it is a fund to cover all their expenses of distribution over manufacturing.

Q. I am referring to the English system of distribution?

A. That stops, and I should have stopped, at the word "stove repairs," but there is a place——

Q. And management is put in separately, is it not, subsequently,
on the next page?
3604 A. Management is put on the next page, but I used the
word "distribution" in the same sense there that I did in your
company; 9.45 cents in your company was everything, outside of holder, not covered by repairs and taxes.

Q. Now, I am asking you to take the entire management expenses. You know wages are lower in Great Britain than in America?

A. Yes.

Q. So you could not very well compare the distribution expense of London with the distribution expense of New York with a view to determining what the distribution expenses of New York ought to be?

A. It ought to be somewhat higher than London, but not the condition I think that exists.

Q. You employed here an argument as to the dropping of the expense of distribution with the addition of the sales of gas. In other words, the greater the sales of gas, the lower expense of distribution?

A. Yes.

Q. Won't you take Field's Analysis for 1901?

A. I haven't it.

Q. Well, I have it. Here is Field's Analysis for 1901. Take it and tell me what the distribution charges are there.

Mr. Burr: Objected to as incompetent, irrelevant, and immaterial. The period we are confined to here is the period of 1905, the existing conditions that are presently in England and the conditions that are presently here are what we are confining our attention to. What existed in 1901 as to gas conditions in London may be entirely different from the conditions that existed here in 1901 or in 1897 may be entirely different than they are for the year 1905, and counsel is strictly limited in inquiry as to the period covered.

3605 Mr. Mathewson: You do not catch the point. This witness on his redirect-examination cited British companies and proceeded to argue that increased sales meant lower distribution. Now I propose to show that from 1901 to 1905 not only the Metropolitan but the suburban companies, which have shown large increase of sales have at the same time shown a very substantial increase in the cost of distribution instead of a decrease; direct matter which you brought out on your recent examination on redirect——

The Master: I will allow it.

Mr. Burr: Exception.

Q. What was the distribution expense of the Gaslight Company of London for 1901? Was it not 3.04 instead of 6.14 cents approximately?

A. I want to make it on the same basis as the others.

Q. No, I ask now for the distribution expenses as they define it in London?

A. Well, that includes the repairs.

Q. It includes the whole thing which they put in as distribution expenses?

A. Well, on that basis, which is a very different proposition from what I was establishing——

Q. Well, I am taking the whole thing, distribution expenses, rather than selecting items that may tend one way and excluding other items which tend the other way.

A. I am not comparing with your 9.45 cents. This does not compare with that, but this 3.04 is the total charge for distribution.

Q. In 1905 what did they charge?

A. 3.72.

Q. Now how about the sales as between 1901 and 1905?

A. There was a large increase in repair items.

Q. I asked how did the sales compare in 1901 and 1905 by the Gaslight Company?

A. The gas sold in 1901 by the Gaslight Company, as given on page 2 of their return, was 21,160,142,000 feet.

3606 Q. And in 1905?

A. In 1905 it was slightly less; 21,018,423,000.

Q. In other words, the sales of the London Gaslight Company fell in those four years, did they not?

A. They fell by about 142,000,000 feet or about one-half of one per cent.

Q. Whereas the distribution cost increased from 3.04 pence to 3.72 pence, or in a much larger proportion, did it not?

A. Yes. The distribution including repairs increased from 3.04 to 3.72.

Q. You are dealing now when you use the word "distribution" with exactly what the English companies in Field's Analysis include under the term "distribution," are you not?

A. Yes.

Q. That is what I want you to do. Now, will you take the Commercial Company of London and tell me whether its distribution expense in 1901 was not charged as 1.91 pence?

A. Yes.

Q. Equal to 3.86 cents, generally speaking; and in 1905 was it not 3.73 pence, equal to 7.53 cents or nearly twice as great?

A. Yes, but the most of it was due to the repairs.

Q. Very good. What were the sales in 1901 as compared with 1905?

A. The sales in 1901 were 2,657,006,000, and in 1905 2,986,533,000.

Q. So that while there was a large increase in sales there was also an increase of distributing cost per thousand feet, wasn't there?

A. Yes.

Q. Now, will you take the South Metropolitan——

Mr. **Burr**: How much was it?

Mr. **Mathewson**: Oh, nearly doubled.

A. The distribution charges increased from 1.91 pence to 3.73, but the salaries and wages only increased from .39 to .53 of a penny. All the rest was addition in repairs.

Q. That is something like 30 per cent. increase in wages?

3607 A. Yes. It is the management charges, I think, that probably——

Q. Now, take the South Metropolitan Company and see if in 1901 the distribution charge was not 3.11 pence or 6.28 cents?

A. It was 3.11 pence.

Q. And in 1905, was it not 3.68 pence, equal to 7.43 cents?

A. Yes.

Q. And what were the sales in 1901 and 1905?

A. In 1901 they were 11,008,945,000 feet and in the later date they were 12,142,723,000; but any comparison of that should cover the same items that I covered and run right down through a series of years.

Q. Now, I take the average of these three companies, and find, if my figures are correct, that in 1901 the average distribution charge was 2.98 pence per thousand or 6.02 cents, while in 1905 it was 3.71 pence per thousand or 7.49 cents; is that about right?

A. Yes.

Q. Now, taking the suburban companies, and taking the twelve suburban companies so-called, and which you have mentioned or which have been mentioned here, I find from Field's Analysis, if I am correct, that in 1901 the charge was 4.07 pence, equal to 8.22 cents for distribution, is that right?

A. Yes.

Q. And in 1905 the charge was 5.67 pence or 11.45 cents for distribution?

A. Yes. But the same thing——

Q. That is an increase of something like 40 per cent., isn't it—35 or 40 per cent. per thousand feet in four years?

A. Forty per cent.

Q. Now, will you give me the sales in 1901 of these companies as compared with 1905?

A. I don't consider that a fair comparison of the point I was making.

Q. Well, I do not consider a good many of yours fair, Professor, but that is a matter of argument. I am getting facts.

3608 A. But this does not take up the same point I made.

Mr. Burr: Do you mean to say it does not embrace the same items?

Mr. Mathewson: It meets the Professor's argument that as sales increase distribution falls per thousand feet.

Mr. Burr: That would be true if you took up the same items of distribution he took up.

Mr. Mathewson: You cannot prove anything by two or three of the items and seeing how they come out.

The Master: This is a matter of argument, gentlemen. Proceed.

Mr. Mathewson: Will the stenographer read the question?

The Stenographer (reading): Now, will you give me the sales of 1901 of these companies as compared with 1905? A. In 1901 it was 7,676,036,000 feet and in 1905 it was 9,540,954,000 feet.

Q. Isn't it true that the management charges increased between 1901 and 1905 in every one of the three Metropolitan companies and in twelve suburban companies with the sole exception of the Gaslight & Coke Company of London? A. That is quite possible.

Q. Won't you see if it is true?

A. But the difference is nothing like as great as in this other. The management charges in the three London companies are given in 1901 as 1.05 pence, and in 1905 as 1.08 of a penny, and for the suburban companies as 1.69 of a penny in 1901 and 1.77 of a penny in 1905.

Q. You said yesterday, referring to the cost of gas, that you thought the cost might be greater on account of the expense 3609 of the recent investigations. Will you point out any item in Exhibit 94 which you think is an expense of the recent investigations or give me from any other source any item which substantially affects the cost of gas and is an expense due to the recent investigations?

A. I am waiting for the report of the accountants to know just what did enter into that.

Q. But you did not wait for the report before you did make this statement?

A. I remember something in the evidence that has been given in this case as to the sort of expenses that have been incurred during the last two years on those accounts.

Q. Can you point out any substantial item that materially affects the cost of gas which you attribute to the expense of those investigations?

Mr. **Burr**: "Legal and advertising," on Exhibit 94.

Mr. **Mathewson**: Advertising? We did not advertise the investigation. And the entire legal charge, if there had been none before, would not very seriously have affected the price of gas, would it? "Advertising and legal" appears in Exhibit 94 to be altogether .8 of a cent only; and can you point out any item also on Exhibit 94 which you say is attributable to the Gas Investigation, as an expense?

A. I understood that there were in those items the expenses that have been incurred on account of those investigations.

Q. Do you think they are large enough from your observation so that they would materially affect the cost of gas where an expenditure of $8,000,000 is necessary to produce and distribute the gas?

A. I think it should be taken into account, so far as they are found to exist.

3610 Q. Rather an insignificant item, wouldn't that be?

A. I don't know.

Q. Can you point to anything that is substantial there?

A. I don't know yet what the facts are on the subject, but I say I think I did not attempt to give figures definitely. But I said so far as there were such expenses, and I believed there were.

Q. You saw that the Gas Commission found the cost of gas to be 60.75 without allowance for the extra candle-power and for a reserve, and don't you know that Mr. Teal in his investigation from 1900 to 1904, found it to be substantially 61 cents every year, about the same figure?

A. My impression is that he found some such result.

Q. Don't you remember that was substantially what he found? You say you have examined this evidence very carefully?

A. I won't undertake to say exactly, but I do remember this, that the expense was a little less, as I recall it in 1905, than it had been in one or two previous years.

Q. But 1905 was the year in which the Gas Investigation took place that all this expense went into to which you have referred and that appeared to be less than in the years before when there wasn't any Gas Investigation?

A. Yes, but that might be entirely consistent with the fact there were expenses in the Gas Investigation.

Mr. **Burr**: Consistent or inconsistent?

Q. Do you think the cost of meter repairs is affected by density of sales?

A. I didn't state that they were in my evidence. I don't think very materially. Of course it takes a less trouble to run 10,000 meters probably than it would in a city which was more spread out, where there were not as many meters per mile of main, that is self-evident, but aside from expenses of connecting the meter and delivering it——

3611 Q. That is not charged to the expense of the repairs to the meter ordinarily, is it?

A. When a meter is taken out for repair and then repaired and put back I thought it quite likely the expense of cartage of the meter to and fro would be included in the meter repairs.

Q. You referred to the fact the other day that the services had decreased in number. Isn't it due to the fact largely that in many buildings there are many consumers now whereas fifty or seventy-five years ago there were very many fewer consumers per building?

A. Certainly. The buildings are higher and more people live on a given number of square feet.

Q. You have one big service instead of many single services?

A. Certainly.

Q. And you have as many meters connected with that service perhaps as were connected originally for the same amount of gas, have you not?

A. Yes. Here is the table which I said at the beginning of the testimony this morning was being prepared at the office, merely giving the figures which I had given offhand, showing apparently that your costs have declined more than they have in London. It is as follows:

Consolidated Gas Profits—1891-1895 *Compared with* 1901-1905.

Authorities: Complainants' Exhibit 84, pages 353-7; State Gas Commission Exhibit 144, pages 1053-1068, being Teele's Report; Complainants' Exhibit 78, page 347; Mr. Addicks' Testimony, pages 1944-5.

3612

Dividends.	Dividends.	Net earning.
1891	1901	1901
$1,771,482.50	$5,821,632.00	$4,028,670.56
1892	1902	1902
2,125,783.50	5,832,328.00	4,604,139.66
1893	1903	1903

3613 (*) The profits are arrived at in this way: Mr. Addicks, pages 1944-5, testified that the gross receipts were $13,730,193.50 and the gross operating expenses $8,964,486.98, from which should be excluded a tax item of $63,222.87, leaving a net expense according to Mr. Addicks of $8,901,264.11, after leaving in the expenses the bookkeeping charge of 10 cents for contingencies, depreciation and renewals. This leaves the net profits $4,828,929.39. If, however, only 5 31/100 cents contingent is allowed as in my testimony, the net earnings would be about $600,000 greater.

Mr. Mathewson: It certainly shows economy and efficient management and want of extravagance, doesn't it, as compared with London?

A. There has been a more rapid growth of business. It has doubled.

By Mr. Burr:

Q. What has doubled?

A. The sales in ten years have doubled in New York. That is a much greater increase than in London.

By Mr. Mathewson:

Q. You referred again yesterday to the three cents for reserve and you stated 10.89 cents was enough you thought for New York City to cover repairs, renewals and reserve. Didn't you in Chicago, as I called your attention earlier, allow 10.16 cents for repairs and renewals alone and three cents reserve in addition?

A. I think I did.

Q. And didn't you say the repairs and renewals would be greater in New York than they would be in Chicago?

A. I don't think you quoted all I said on the subject in Chicago.

Q. Well, didn't you say that?

3614 A. I think I stated—well let us read what I did state in Chicago. My impression is that there was a phase—it was not exactly what you give. The figures I think are the same but I would not swear to some things in connection with it that perhaps is not——

Q. Isn't it true that in a coal gas plant, or a mixed coal and water gas plant, there are generally greater repairs and renewals than in a strictly water gas plant?

A. Yes.

Q. And Chicago is a strictly water gas plant, is it?

A. Yes, or it was at the time.

Mr. Burr: What page of the testimony yesterday are you referring to?

Mr. Mathewson: Page 41. After allowing——

Mr. Burr: Of his testimony yesterday?

Mr. Mathewson: No, I cannot tell you the page yesterday, because I only got the testimony as I came in. Page 41 in Chicago, after referring to the allowance about reserve, and so forth:

"The New York Consolidated Gas Company produces about one-quarter of the gas it makes in the form of coal gas and therefore requires more extensive repairs."

Mr. Burr: I think you read that once before. You are becoming much too infatuated with that book.

Mr. Mathewson: The witness took it up again and allowed 10.89 cents yesterday.

A. On page 41 I find my statement in the letter as follows:

"For meeting extraordinary depreciation, however, I have just computed in the New York case that a further allowance of three cents would be ample, and I think it would be on the safe 3615 side, although hardly necessary to concede in Chicago also three cents."

So it seems, I did not consider it hardly necessary, but I said to be on the safe side I would concede it.

Q. And you did concede it in your computation?

A. I did.

Q. And didn't you say down below, a little further on,

"It must be remembered that exclusively water gas plants like that in Chicago do not require as large repairs and renewals as do the mixed coal and water gas plants in New York."

A. Yes.

Q. And you allowed 10.16 cents in Chicago for repairs and renewals?

A. Yes. Since then I have the information of your witnesses in this case, indicating that there was not any three cents necessary.

Q. But you have said that over and over again and I did not ask you any such question.

Mr. Burr: Well, you asked him the question.

Mr. Mathewson: I did ask him about repairs and renewals, not about reserve at all.

The Witness: I include all of it in 10.89.

Q. While, at the same time you allowed 10.16 for repairs and renewals alone in Chicago and stated that New York would require more for repairs and renewals, did you not, as I have just quoted from your statement?

A. I said,

"I have just computed in the New York case that a further allowance of three cents would be ample,"

that is, I computed that a year ago, before the recent testimony.

Q. That was in addition to the repairs and renewals of
3616 10.16, wasn't it?

A. Yes.

Q. And then you went on to say:

"It must be remembered that exclusively water gas plants like that of Chicago do not require as large repairs and renewals as do the mixed coal and water gas plants of New York."

Now, have I quoted exactly?

A. Yes.

Q. Well, I will leave it there. Now, when you talk of renewals and repairs, isn't the line between the two very close so that it is sometimes difficult to distinguish whether an item should go to renewal or repair?

A. Yes.

Q. So that it is the best practice, isn't it, to take repairs and renewals together in a single amount to determine what should be allowed for that item?

A. Quite common to do that.

Q. Isn't it the better and the safer way in view of the differences in bookkeeping and discrimination in charging to one or the other account in different companies, if you desire to compare different companies?

A. I think that strictly speaking the more scientific plan of getting it exact is the sinking fund method rather than to lump it all together as an expense.

Q. I am not referring to that feature at all. I am only saying in dealing with the subject of repairs and renewals—current repairs and renewals, if you please—isn't it the best method of comparison to take the sum of repairs and renewals of different companies if you desire to compare them instead of comparing the repairs of one, with what are charged as repairs of the other, and the renewals of one with what are charged as renewals of the other?

3617 A. The main thing is to get the value on the same basis in comparison.

Q. And isn't it a safer and surer basis to take the repairs and renewals together when you come to compare with the repairs and renewals of another company, so as to eliminate the difference in method of charging one account or another?

A. I think there is more agreement among engineers as to the amount of repairs necessary in the long run than there is in the amount of renewals, and there is great difference in the practice.

The Master: Cannot you answer directly?

The Witness: No, I say it is not safe to combine them in comparing one company with another unless you know they have treated renewal account on the same basis. If they have then it is better to unite the two items in the comparison.

Q. But where you haven't all the details showing precisely how each company treated it the safer way is to take the sum of repairs and renewals and compare it with the sum of repairs and renewals in the other plant, isn't it?

A. No, I think not.

Q. Now, you have spoken about the depreciation item as allowed by the Massachusetts company's municipal plant, three per cent. being fixed as the standard? Aren't you familiar with the hearings given by the Massachusetts Gas Commission in reference to Holyoke applied under the former law before amendment for permission to charge depreciation of less than five per cent. and the Gas Commismission refused to sanction it on the ground that five per cent. was not excessive.

A. I am somewhat familiar with that but there was a special condition there.

Q. Well, whatever the condition, that was the fact as to
3618 Holyoke, wasn't it?

A. But the condition is too important, it should not be ignored.

Q. Very good. State the condition. I do not wish to take any advantage of you?

A. The condition was that the depreciation was to cover, as I understood it, not normal depreciation in structural assets, but the depreciation in the difference between what the City had paid for the plant and its structural assets. The City had been forced by the Commission or had been directed by the Commission to pay a price which was apparently more than the structural assets, and that the State desired to have written off, as well as any decline from year to year in structural assets.

Q. Now, if you take the three per cent. which is established as the standard rate we may say in this municipal act to which you have referred in Massachusetts, that is one-half per cent. more than the two and one-half which Dr. Humphreys used in his computation of so-called life of plant, isn't it?

A. Yes.

Q. And you say that you took a thirty-three year average life of plant because you accepted a statement to that effect made by Mr. Humphreys.

A. That is a year ago, you mean, I did.

Q. Yes, a year ago, on a previous examination. Will you point out where Dr. Humphreys used thirty-three years for that purpose?

A. I took certain periods that he had given in the Holyoke case for the life of various parts of a plant and applied it to the whole plant, I have forgotten what now, and thought it would average thirty-three years.

Q. But you didn't find that he in that testimony or any other testimony took thirty-three years and stated it to be the life of a plant, did you?

A. Since that question was raised the other day, I have looked to see and I have not come across it and I think that forty 3619 years is more likely what he has always used. I simply meant to say that I had understood him to use thirty-three years when I was testifying in the Chicago case.

Q. You have referred to some practice in England in reference to retirement of debt by sinking fund. I will ask you again whether since you previously testified you have ascertained any company in the country which establishes or has established a sinking fund to accumulate instead of making final repairs and renewals currently?

A. No, I don't know of any.

Q. You referred to the cost of gas of the Consolidated Company of Boston, the average of that produced by the Coke Works and that produced by the Bay State as 31 and a fraction cents. Do you remember what it was—31.73 cents, was it, cost at the holder?

A. Per thousand feet made, I have it 31.25 cents, and per thousand feet sold 31.85 cents, in my notes here.

Q. For what period is that?

A. For the year ending June 30th, 1906.

Q. Haven't you information that the cost of gas computed on the make was 34.31 cents to the Boston Company for the year ending June 30th, 1906?

A. I have no such information.

Q. Where do you get your information that it is 31 and a fraction cents?

A. I will give you that information now. For gas bought they paid, as given on their return to the Gas Commission, $520,602.29 and I have it here that——

A. Yes, I find it before me—that for gas made, manufacture of gas at the works $878,065.98. And then residuals are $152,455.56; deducting that left a net cost at the holder of the gas made $725,610.42, and that added to the figure just given of gas bought made a total of $1,246,212.71.

3620 Q. I was asking you about gas made, not gas bought, gas made by the Boston Company, not that received from the coke works?

A. Excuse me. I was giving you the combined figure of all.

Q. Well, that was not the question. I was asking you whether on gas made the cost was not 34.31 to the Boston Company?

A. I have it higher.

Q. Made by itself. Well, what have you higher?

A. I have the cost of the gas made after deducting residuals was 42.05 cents.

Q. That is by the Bay State?

A. Oh, that was by the Consolidated Gas Company, that is all put in here as one company, kept in this return. I haven't it separated for each one of those plants. That was done in the hearing in Boston before the State Gas Commission for that previous year.

Q. Very good, let it go. Now, as to the New England Coal & Coke Company gas, you now say you find it was enriched before delivery to the Boston Company?

A. I find it was so enriched in the years 1903 and 1904, as brought out in the testimony before the State Gas Commission, and I think I stated that that was the last year, for which I have information. The candle power from my recollection is, and I read it last night, that my testimony was that it was about nineteen. My recollection is about nineteen candle power. It was enriched partly by the coke works and partly by the Massachusetts Pipe Line.

Q. And that residual gas so received from the coke company you say went to the Consolidated Gas Company at about 23 cents for the last year?

A. Yes, during the year just closed.

Q. Whether that was enriched, and if so, to what candle-power during the past year, you don't know, do you?

A. I do not.

5621 Q. Now, you testified that you understand now that the Dominion Coal Company that furnishes this Nova Scotia coal at $1.35, alongside, is not controlled by the same parties who now own the Consolidated Gas Company of Boston or the New England Gas & Coke Company, which?

A. I testified that so far as I could learn, and the only information I could get, was the directors and officers were altogether different individuals, in the case of the Dominion Coal Company or either the Boston Gas or the New England Gas & Coke. I didn't say that I knew positively whether it was the same interest or not, I only know that I got this information from *Moody's Manual*.

Q. At the time you did testify that they were under the same control your information was, was it not, that Mr. Henry M. Whitney was the president of both companies and that they were controlled by the same interests?

Mr. Burr: He didn't testify that he knew they were both under the same control.

Mr. Mathewson: Oh, I read his testimony from the Gas Commission and what it is, it is.

A. Why, I don't remember that I ever testified as to who was president of the New England Coal Company, but I did suppose that there was a very close connection between Mr. Whitney and the Dominion Coal Company as well as between Mr. Whitney and the New England Gas and Coke at that time, two years ago.

Q. Your best information was then, was it not, as you testified before the Gas Commission, that they were controlled by the same interest at that time?

A. I suppose they were two years ago. I know nothing of what has happened since.

Q. And you know, do you not, there was a contract in existence for the delivery of the coal at the time?

3622 A. Yes, I suppose there was, and *Moody's Manual* shows there was a contract for the delivery of it.

Q. The contract has not yet expired?

A. I suppose not. It is a contract according to *Moody's Manual* for the delivery of coal and something of that kind.

Q. Now, what did I understand you to say about the sales being an average of 80 cents or 86 cents in Boston?

A. I said that if the sales to private consumers at 92 and a small fraction cents in the year just closed be added to the sales to other companies at very much less than that and then the total price divided by the total sales, would give that figure; and I said that if for the next year we take the same figures of sales in feet but substitute for the 92 cents to private consumers the price that went into effect July 1st of 85 cents that would make the average a little under 80 cents.

Q. Don't you know that the gas that was delivered to other companies and which you have included at the price for which it was delivered to the other companies was delivered to them for distribution to their consumers?

A. Certainly.

Q. And do you mean that you consider it fair to take the price at which the gas was delivered to these other companies in their holders or in their mains, with no expense of distribution at all in, and compare that with the cost of gas to private consumers, delivered by the Boston Consolidated Gas Company at the burner?

A. No, unless it is coupled with further statements which I brought out, namely, that I stated it was sold to other companies. I didn't state it was sold to private consumers; and it must be coupled with this further fact that the cost of gas to the Consolidated Gas Company of a little over 30 cents would be higher probably if it did not buy so much in bulk from the New England Gas & Coke 3623 Company; it buys in bulk and then it turns around and sells perhaps one-fifth of what it buys to other companies. I do not consider myself that it should be stated that the price of gas in Boston is 79 and a fraction cents this year apparently as contrasted with $1.00 in New York, and I consider it is much fairer to compare 85 cents in Boston with $1.00 in New York.

Q. But did not the sales of gas to private consumers during the past year in Boston average 92 cents?

A. The present year?

Q. 92 cents?

A. I may have misled you by what I said. I meant to say 85 cents since July 1st in Boston.

Q. During the past year the average was 92 cents in Boston?

A. That's right.

By Mr. **Burr**:

Q. Since July 1st, 1906?

A. Since July 1st, 1906, it has been reduced to 85 cents in Boston. Before that it averaged 92 cents during the previous year.

By Mr. **Mathewson**:

Q. And you understand that under the Massachusetts law the company is entitled to increase the price to 90 cents if it chooses, do you not, legally?
A. Oh, yes.

At 1:05 P. M. a recess was declared till 2:15 P. M.

3624 After Recess.

Edward W. Bemis resumed.

By Mr. **Mathewson**:

Q. You referred yesterday to some instances in which the Massachusetts Gas Commission had reduced the price of gas and named some cities for the purposes which you described. Is there any city in the list in which the price of gas was reduced by the Commission below $1.00 except the City of Charlestown?
A. No.
Q. And does not the City of Charlestown get this cheap coke company's gas?
A. I don't know. It did at one time, and they testified in a hearing, where I represented the city and was in that case, before the Commission, that they thought they would have to give it up and make their gas. And the Commission——
Q. You don't know of your own knowledge that they made any change, do you?
A. No. I read the report of the Commission in which they said it might have to be made or that the company thought so, but I don't know.
Q. If they find themselves unable to get this cheap gas, I suppose the Commission has the power to raise the price for them if necessary?
A. Yes, the Commission made the statement that they did it even though they might have to make their own gas.
Q. Let me ask you about this testimony of yours in Springfield, Illinois, in 1897. Do I understand you to deny that you said in substance in 1897 before the Legislative Committee at Springfield that you thought 90 cent was a fair price for the City of Chicago at that time for gas?
A. I wish to be understood as saying that I do not remember what I said then.

3625 Mr. **Burr**: In connection with the 90 cents?

The **Witness**: In connection with the 90 cents. All I remember is that I appeared before a committee, of which Senator Crawford was chairman, with respect to the consolidation of Chicago gas companies, or in connection with some bill relating to them, but I really don't remember what I said.

Q. Don't you remember that the question as to the price of gas in Chicago, or the price which should be allowed for gas, was discussed?

A. I think it was.

Q. Well, have you any doubt that you testified at that time that you thought 90 cents would be a fair price?

A. I have no recollection about it, none whatever.

Mr. Burr: That was in 1897?
The Witness: Yes.

Q. That is the best answer you can make, is it?

A. Yes.

Q. What do you mean then by your statement in yesterday's testimony "I don't believe I said it, but I have come to the conclusion I must have said it," in referring to the 90-cent recommendation?

A. I came to the conclusion in Chicago, I meant to say, that I must have said it, and in the previous testimony here a year ago, because of the insistence on the part of two or three people that I had said it, but I do not recall it.

Q. You are not willing to swear that you did not say it, are you?

A. No, I don't remember anything about it.

Q. Now, you referred to the Massachusetts dividends, and stated that the income of all the Massachusetts companies, net earnings, was $1,864,701.50, if I understood you correctly. Is that the
3626 earnings of all the companies including Boston?

A. I so understood it.

Q. And you stated that the return on the capitalization as paid out in dividends was 6.71 per cent., is that right?

A. Yes, that was taken from the last report to the Massachusetts Gas Commission.

Q. That was an average, was it not?

A. Yes, that means that there were a good many companies above 6.71, does it not? Whatever the percentage I gave, was it 6.71?

Q. Yes.

A. Of course, the average would not be the exact amount of all companies.

Q. And you do not claim, do you, that a well managed and a well situated company shall be held down to the average which all companies are able to earn whether well managed or whether well situated?

A. I have not said that. My basis of 6 per cent. was reached in another way.

Q. Were the Boston companies paying any dividends in 1904, the year which you selected for this computation?

A. The year 1904-5, do you mean?

Q. Yes, the year which you selected. Was it the year 1904-5?

A. Yes, that is the year covered by the last annual printed report to the Commission.

Q. What was the dividend of the Boston Gas Company at that time?

A. Well, I did not bring the report with me. I think it was 8 per cent., but I am not absolutely positive.

Q. You did not compute what they were earning on their capitalization as distinguished from what they were paying out in dividends, did you?

A. Not for that year. For the year just closed I did. I found out they paid out in dividends all they claimed they earned.

Q. Did you make any computation for this same year 1904-5 on that same basis?

A. No, but I did for the year just closed.

3627 Q. Do you mean to say the companies paid out in dividends all they earned and put up no surplus?

A. I thought you asked about the Boston Consolidated Company.

Q. No, I asked as to all these Massachusetts Companies whose average you stated was 6.71 per cent. paid in dividends.

A. Oh, no, I did not make that computation.

Q. Nor did you compute for that year how much they earned or paid on their structural assets as distinguished from their capital stock outstanding, did you?

A. No. I think the Boston Company should be corrected for the year just closed. I think it was 7 per cent. for the year just closed, and that included all their earnings.

Q. Well, what was the Boston Company paying in 1904-'5 as distinguished from the——

A. That I don't remember but I think it was 8 per cent. I don't like to——

Q. Referring to this 7 per cent.——

A. I don't like to be very positive about the dividends there were in 1904-5, because the more I think about it the more uncertain I am.

Q. As to the dividends paid by the Boston Company during the last year ending June 30th, 1906, it appears, if I am correct, that the amount of dividends declared were $1,209,968. That would be 8 per cent., would it not on the capitalization, instead of 7?

A. I have it all here and can tell you——

Q. That is a very simple question. All I have asked is whether it would be 8 per cent. instead of 7.

A. The capital stock was $15,124,000——

Q. You can tell about, can't you?

A. I am looking for the dividends. Eight per cent., that is right.

Q. And you say the Boston Company paid all that it earned that year?

A. I have so computed it. The balance to profit and loss was $1,142,166.39 and the amount paid out in dividends seems to have been $1,209,968, but in addition there was some other ex-
3628 pense, interest on notes $10,908.53 and sundry charges prior to July 1st, 1905, $21,702.50 and amount carried to employees' fund $50,000, so that in reality the total debit was $1,371,632.42.

Q. So that it did not earn its dividend according to that by about $200,000 and odd dollars, $230,000, wasn't it?

A. There was a profit from the electric business of $129,539.80 and some other interest, so that its total—the final total earnings or receipts did not equal its disbursements of dividends and interest by $82,668.73.

Q. Now you spoke yesterday of the Haverhill case, and stated that in that case it was claimed that the structural value of the Haverhill plant had been built up out of the consumer. I am correct, am I not, in understanding your testimony?

A. I believe I so testified. That is, a large portion of it, not the whole of it.

Q. And therefore there was a question whether they should capitalize the plant, so far as it had been built up, out of the consumer?

A. Yes.

Q. That I suppose means that after payment of proper dividends and proper charges for the cost of gas, and a proper reserve, if any should be allowed, that there were still surplus earnings out of the consumer which had been put into plant?

A. Yes.

Q. Now in the case of the Consolidated Gas Company, unless part of that 10.89 cents which is charged for repairs and renewals has gone into the plant, nothing has come out of consumers to add to the cost of the Consolidated Gas Company's plant as far as you have observed, has there?

A. No. Of course there may have come out of the consumer the $2,000,000 due to the company, and unpaid and which did not exist at all in 1884, and something of that kind.

3629 Q. But that has not come out of the consumer yet, if it is still due and unpaid.

A. No, going to come out of him, we will assume.

Q. And what there may be to offset that in the way of accounts on the other side you have not considered?

A. No, I have not considered those.

Q. And the Haverhill case has been in the courts a great many years, has it not, ten or twelve years, something like that, a very long time anyway?

A. It was in the year 1898 or 1899 that this case was tried in Haverhill and therefore it has been seven or eight years.

Q. And how long it was in the courts before the trial came off, of course you don't know?

A. I think I know that it came up first in the trial, that is the case has gone into the courts with respect to sustaining the decision of the Commission, so it could not have arisen before. I was in the Haverhill case and remember that feature of it.

Q. You speak of Chicago, where you fixed a structural value at $3.20 and compare that with New York when you say the assets upon the Yalden's figuring with the additions amount to about $2.20, which makes, if I understand, $1.00 difference per thousand feet of sales in the relative capitalizations. Is that right?

A. Yes.

Q. And you say that that can be explained by a difference in the bids?

A. Not altogether, I did not mean to say. The Yalden figures, which I did not tie down to as absolutely conclusive, are based on the cost of the land at the time it was bought, but I said most of the addition was due to the mains.

Q. Did you take the cost of the Chicago land at the time it was bought or the value which you considered to-day?

A. I don't recollect.

Q. You certainly must have had some definite idea on that, Professor, didn't you, as to what you were taking?

3630 A. I think I took a figure based upon a general view of the cost of water gas plants per thousand feet of capacity and some knowledge that I had of other features of the plant and made some assumption on land, but I think I stated very positively to the Committee that no very close approximation could be given without an engineering investigation.

Q. I know, but let us take this tribunal instead of that Committee. You said your $3.20 in this pamphlet which I have called your attention to relating to Chicago, was the cost of duplication. That means, does it not, the cost of the land, if procured to-day?

A. I don't know just how I took it, but I think I took it on that basis.

Q. And yet, in figuring out the $2.20 upon which you say the Consolidated Gas Company is entitled to a return, you take, not the cost or value of that land to-day, but the original value beginning with 1823?

A. I think that should be done in Chicago, too, but I did not have any data for it.

Q. Then you do not make this $1.00 difference relating wholly to mains?

A. Not wholly, but it is largely.

Q. What is the condition of the streets of Chicago as to pavements, as compared with New York?

A. It is poorer.

Q. Much poorer, isn't it?

A. Yes.

Q. Are not the streets of New York more congested than Chicago?

A. Yes.

Q. Is not laying of mains very much more expensive in New York than in Chicago?

A. Yes.

Q. Is there any rock to speak of in Chicago?

A. No.

Q. What is the cost of excavation of a trench, say, for an average pipe, as between earth and rock?

A. I have not the figures with me now at all.

3631 Q. Is not the cost of putting mains through rock in a city street with the care there has to be taken by reason of the surroundings five or even ten times as much as it is digging a trench to lay the same main in?

A. Not that difference, but there is a considerable difference.

Q. You don't think it would be as much as ten times?

A. No, not——

Q. The excavation in soft earth, and I am speaking now simply of the excavation of the ditch, does not the excavation of a ditch in rock——

A. Where you have to blast, do you mean?

Q. Well, not necessarily, because in a city like this you cannot blast frequently, but have to pick it out. In such a case as that is not the cost of producing a trench four feet deep in solid rock ten times a much as it would be to dig that trench in soft earth?

A. I would not undertake to give the exact figures.

Q. You have spoken about the mains in Chicago as being 2½ times in mileage what they are in New York?

A. Yes.

Q. And that the density in New York is greater. Do you know the sizes and lengths of main in New York classified as to sizes?

A. Only as given in the exhibit, yes.

Q. Have you got it in Chicago?

A. No. I have it in New York, that is what I meant to say.

Q. Do you know how the mileage in Chicago compares as to size of mains with New York?

A. No.

Q. Are not the larger mains very much more expensive?

A. Yes.

Q. Both to purchase as material and to lay when you have purchased them?

A. Yes.

Q. Because you have a very much bigger ditch, is that not so?

A. I have no reason to believe that the mileage would be much larger in New York, that is they have to take out from the works here 2,000,000,000 feet more than they take out from the works in Chicago.

3632 Q. I am trying to find out what you know about it. Is it not true that the heavier the consumption off mains the larger the mains, other things being equal?

A. Yes. I think it would be larger here than in Chicago.

Q. So you cannot take two and one-half times the figures of the New York mains and say that that represented the value or cost of Chicago mains?

A. No, not directly.

Q. You gave the cost of the Chicago plants by your estimate as something like $35,000,000?

A. I said $3.20 multiplied into the 11,000,000,000 feet.

Q. That would be a little over $35,000,000?

A. I think so.

Q. Now, your figures for the mains in New York as I called your attention to them in your cross-examination were about $8,400,000. If you multiplied that by 2½ times, assuming that the mains were of the same size and same value, that would make something over $20,000,000, would it not?

A. Yes.

Q. You would not say for a moment, would you, that the value of the mains in Chicago was over $20,000,000 if the value of the entire plant, manufacturing, holders, mains, meters, services and everything was only $35,000,000?

A. I think that would be a little too large a proportion but——

Q. Have you any reason to suppose that the mains in Chicago cost more than $5,000 per mile, laid?

A. To lay?

Q. Laid as they are, as they stand?

A. I think they would cost—well, I don't know, I would not undertake to say.

Q. That would not be an unfair figure, would it, offhand?

Mr. BURR: If he knows.

Mr. MATHEWSON: I am asking the Professor on this subject——

3633 The WITNESS: Well, I don't know that.

Q. In soft earth?

A. I would have to know the average size and a great many things I don't know about the Chicago mains.

Q. Well, assume an average size, that would not be out of the way, would it, $5,000 per mile?

A. Well, I don't know the conditions in Chicago. They claimed there in the testimony according to Meagher's claim that the expenses there were very large for laying.

Q. They are large anywhere for laying?

A. He said they were much larger there than Cleveland.

Q. Who is Mr. Meagher?

A. The attorney for the company.

Q. In your calculation, did you estimate at more than $5,000 a mile?

A. I don't remember now.

Q. And you would not say that you did, would you?

A. I could not say.

Q. You would not say positively that it would cost more than $5,000 a mile on the average to lay those mains, for material and labor?

A. I could not say.

Q. So you are not prepared to say how much, if any, difference does arise by reason of the greater mileage of the mains in Chicago in the total value of plant?

A. I have not attempted to fix a definite cost of the mains here. I have taken only the book value of the mains and the various data of the 1884 valuation and the extensions since then. I have not attempted to make an independent estimate as to the value of the mains, that is, in this hearing.

Q. Yes, but yesterday in your redirected-examination you made some comparison between the $3.20 per thousand feet for capital value in Chicago and $2.20 in New York, and I understood you to
attribute that difference largely to mains. And I am trying
3634 to find out whether you had any foundation for that. You
say you are unable now to make any comparison?

A. I know the considerable portion of it was due to mains. They have 1,200 miles more mains there than here.

Q. But it may have been smaller on the average and have cost very much less to lay per mile?

A. I think the 2,000 miles will cost much more than the 800 miles here.

Q. Let us take $5,000 per mile, which you say you cannot say was too low, and figure that. That amount multiplied by 2,000 miles would be how much, $10,000,000 would it not?

A. Yes.

Q. The figures for the mains here in New York were $8,400,000, which would mean about $1,600,000 difference on that basis?

A. I think that is sufficient itself to prove that—my figure in Chicago would be higher probably.

Q. We do not think it is. You conclude merely from that comparison that the figures in Chicago would be higher without knowing what the size of mains is in Chicago as compared with New York, and without knowing what the cost of laying them is in Chicago as compared with New York?

A. I think it would be more than that.

Q. Do you know anything about it?

A. No.

Q. In Montreal you stated you took $4.30 as the value per thousand feet?

A. Yes, sir. It came to that.

Q. And you said you made that average among other things, because that was a municipal plant and you wanted to be on the safe side. Is that a fair statement of your testimony yesterday?

A. I do not think it is quite what I said, but it is along the line of what I said.

Q. And you thought, did you not, that the city might establish a municipal plant which would test your figures, and you wanted your figures to be fair?

3635 A. It was not that; but I wanted them to be quite high enough to warrant,—I knew there was always a margin with a municipal plant, with a possibility of large cost.

Q. When you are going to estimate for a private plant, don't you want to be just as fair and liberal?

A. Yes, and I want to in this case, and that is why I want this engineering valuation. I have been the most insistent in asking for it——

Q. Do not wander off. Just answer the questions and we will get along more rapidly. Why yesterday did you lay emphasis on the fact that you gave this liberal estimate because it was a municipal plant?

A. I did not lay great emphasis, but I said it did affect my view of the cost. I wanted to be very liberal with them. I would rather err on that side in makiig such an estimate as that, but I do not think it is necessary to take that into account at all in explaining the difference. I took lower unit figures than I have here.

Q. Lower unit figures on what?

A. Lower unit figures than were taken here.

Q. On what?

A. On coal gas and water gas I think—or at least no higher figures per capacity, about the same, about $100 for water gas and $200 per thousand feet capacity for coal gas.

Q. $100 to cover what?

A. Just the manufacturing plant aside from land and holders.

Q. But your whole thing figures up $4.30 average for the entire outfit.

A. Yes, but they had three hundred miles of mains.

Q. Is it not a fact that you did take $4.30 all told?

A. Yes.

Q. Now you bring up the question of mains and output.

A. And I gave them a larger manufacturing capacity in proportion to their annual sales than what the testimony shows they have here in New York, where they buy even part of the gas they sell.

3636 Q. Yes, but the gas which we buy, as you put it, requires a plant to produce it and we will reckon with that later, so that need not make any difference with us. In the City of Montreal, as in other cities, I suppose, labor is the one thing that goes to produce every part of plant, that enters into every detail?

A. Yes.

Q. Are not wages lower in Montreal than they are in New York?

A. I should think they would be but I do not know definitely.

Q. Did you not testify in Chicago that they were?

A. Very possibly. I think myself they are now. I don't know what I testified.

Q. Now let us take mains. You said that they had to be laid six feet deep. The cost of the system of mains for a great company is a small fraction of the total value of the entire plant anyway, is it not, generally speaking?

A. It is quite a charge.

Q. Oh, a substantial part, but it is not the half of it.

A. Mains and services often constitute over one-third.

Q. In New York they did not, according to Yalden's figures in 1884, did they?

A. I don't remember now, just what his figures were on that.

Q. Now, the expense of digging a ditch two feet deeper than in New York is not going to make a very great difference, is it, in the capitalization per thousand feet of your entire plant if it is dug just in the soil of Montreal?

A. The report shows there was a good deal of rock there but——

Q. How much rock?

A. I have forgotten exactly.

Q. I have your report. Look at page 1370 and see if it does not appear that the entire number of miles of rock through which the city water mains are laid is only 12¾ miles and if you did not consider that and use that in your estimate?

A. I stated in another place just what percentage I used of rock. I think you can find it.

3637 Q. Yes, 12¾ miles, is that right?

A. I think you are looking at the wrong place, not what I refer to.

Mr. Burr: What is the document you are referring to?

Mr. MATHEWSON: This is the Professor's report to the City of Montreal.

The WITNESS: This is what I said: "In the system of 300 miles it is assumed that 25 miles will be laid in rock and 33 miles in paved street. The entire number of miles of rock through which the city water mains are laid is only 12¾ and the suburban companies, if I recall aright the statement of its engineer, has less than ten miles in such ground. Then since this proposition was to cover a gas works which went out into the suburbs, where the other rock was located, I assumed 25 miles and not twelve.

Q. Is it not a fact in Montreal there were only 23 miles of modern paved streets, with modern paving?

A. Yes.

Q. And there were about 300 miles of streets altogether, were there not?

A. In the city and suburbs, I think, there were.

Q. Which you dealt with in your estimate?

A. Yes.

Q. And is it not a fact that there were only about 100 miles of permanent sidewalks and the other 240 miles were wooden sidewalks?

A. I don't remember now, but if it is in the report I accept it. It is about that.

Q. These things were before you at the time you testified before the Gas Commission?

A. Yes.

Q. And I read from your testimony——

A. I accept what you read.

Q. "And with approximately 100 miles of permanent side-
3638 walks and 240 miles of wooden walks."
The cost of labor is less in Montreal than in New York?

A. Yes, but material is higher.

Q. Is not land cheaper in Montreal than in the Island of Manhattan?

A. Yes.

Q. Is it not cheaper in Chicago than in New York, if you choose your own site for a gas plant?

A. Yes, and buy it to-day, I think so.

Q. Can you tell me now the average structural value of gas plants in the United States taken as a whole per thousand feet? It appeared in this table that you quoted something—$7.23.

A. What you show me is a computation made by the City statistician of Chicago and purported to be compiled from a United States census report. I have not attempted to verify the computation. I didn't have, when I was testifying the other day, the bulletin from which that was quoted.

Q. Well, that is the same table from which you have already quoted one or two things, is it not?

A. I did not quote from that statement of Mr. Grosser's at all. I quoted in my testimony direct from the bulletin itself, but I do not think there is any large difference between the figures.

Q. This appears to be $7.23, which is the same figure that we used before the Gas Commission and in our briefs. Have you any doubt that is substantially correct?

A. No. I think it differs a little from the bulletin, I don't know just how, but the difference is not large. Some figures are different. I noticed Massachusetts is a little different.

Q. But you think it is substantially correct. If you find it is not, you can correct it.

A. Yes.

Q. Now, referring to the cities which you named in table 19——

A. On bonds and stocks, is that?

3639 Q. Yes. You stated that including all of them that there was an increase of assets approximating the increase of sales and that if you left out Lowell and Lawrence the result would be somewhat different. Leaving the situation as you left it, is it not true that the assets or the capital would not show a corresponding increase to the sales or to the proportionate sales if the stocks were sold at a premium?

A. The stocks and bonds and notes did not appear to increase much.

Q. And that might be due, might it not, in the case of Cambridge, for instance, that the stock was sold at double its par value so that the stock was increased at only 50 per cent. really of the increase of assets?

A. Yes, so far as there was a premium that would affect it, that is true. I don't think——

Q. And it would affect Lowell particularly, would it not?

A. Yes, I don't think it would wipe out the difference, however.

Q. Pardon me.

A. I don't think if the stock increase of about half a million of dollars, stocks, bonds or notes, I forget which it was that increased, but there is usually quite a premium on stocks, and I do not think the stock increases after taking account of the premium would——

Q. Equal the increase in assets?

A. Yes, equal the increase in sales.

Q. Or equal the increase in assets?

A. I don't know as to that. They were not very different, however.

Q. The assets might be increased there from application of premiums on stock or by application of surplus earnings to capital account?

A. Yes.

Q. You spoke of sales in Boston in 1892 and 1893, as compared with sales in Boston in 1895 and 1896 and showed quite a 3640 large increase. Will you name the companies which you included in that computation?

A. That was a computation for one year in each case. It was not the years 1892 and 1893 but the year 1892-3 because their year begins July 1st, likewise for the other year, whatever it was, and I took the six companies that sold to private consumers, that is, I omitted the Bay State and the Massachusetts—the Massachusetts

Pipe Line, I think, was not in existence—I omitted the Bay State. That left the Boston, Brookline, Jamaica Plain, Roxbury, South Boston and Dorchester.

Q. Now, in reference to New York, you spoke about the sales from 1890 to 1895 being 33,173,000,000 feet?

A. Something like that, as I recall it.

Q. And from 1900 to 1905 as being about 61,000,000,000 feet?

A. Yes.

Q. Now, 1890 to 1895 included the period, did it not, of very great depression, for the sales of the company did not increase at all?

A. Yes. Two years, I suppose, of it.

Q. Whereas the period of 1900 to 1905 included a period of great prosperity, that included the two coldest winters on record, and included the period of the coal strike, all in one. Would not that have a material effect in making these comparisons?

A. I have already testified as to two of those causes having an effect, namely, the prosperity and the coal strike. I have testified that as to the cold winters I was not aware that that effect would be——

Q. As to the increase in assets——

A. I will frankly say, in a natural gas territory where people depend on gas for all their heating, then a cold winter would certainly increase consumption of gas, but I was testifying with regard to New York when I said I was not certain.

Q. We will take the proportionate increase of assets of the 3641 Consolidated——

A. Nine per cent. I think that was on the average.

Q. Whatever it may have been. You understand, do you not, that within the last two years the company has been crowding its buildings with machinery until, as the testimony is, there is room for no more?

A. Yes.

Q. So that that increase might be due, to some extent, to the fact that they have larger buildings in which they were able to install more apparatus without purchasing more land or buildings?

A. Certainly. The fact that the assets increased so slightly over nine per cent., while the consumption doubled, was in part due to a greater use of the land as manufacturing plant and partly to the fact that the company has been purchasing part of its gas, but that would not account for it all by any means. The assets would not have increased, I believe, proportionately to the sales even if you take account of those two factors.

Q. The argument is then that the increase shown does not represent a normal increase provided the company had purchased all its own gas and had a plant reasonably crowded with apparatus, but not over-crowded, but at the same time that you think that the assets would not have kept up the same proportion of increase as the sales?

A. That's right.

Mr. Burr: I want to call attention to a mistake made on page 3546. The last question: "What has been the effect on price of price reduction in New York?" It should be, "What has been the effect on profits of price reduction in New York City?"

Q. Referring to the table of dividends from 1887 to 1905, I understand you to say now that you took in 1897 the amount
3642 which was paid in dividends without respect to the amount of earnings?

A. I believe I did. I had no earnings before me and I do not consider it as fair a comparison as to take five years as I had just done in another comparison, taking the five years ending with 1895 and comparing them with the five years ending 1905.

Q. Well, that is the table which I hold in my hand and which I have preliminarily marked 21?

A. That is the table that takes the five years. I consider that fairer than a table that takes one year, but I brought that out because so much has been said of the year 1897 as representing relative conditions as to cost.

Q. But even in this table 1891 to 1895, you have dividends paid out, without regard to the amount that was earned in those years?

A. Yes.

Q. On the other hand, from 1901 to 1905 I understand you take earnings rather than dividends?

A. Yes. I did at first take a table of dividends and might have inserted it there. It would have brought out a larger payment, but I considered it fairer to take the earnings and should have preferred to take the earnings for the first period if I could have found them, but I had no data about them.

Q. As a matter of fact, isn't this an unfair result of the operating period from 1891 to 1895 when the dividends paid out were not equal to the earnings, to compare it with the years 1901 to 1905 when the dividends paid out exceeded the earnings, as you observed by the testimony, didn't you?

A. I had no evidence as to whether the dividends exceeded the earnings in the first period.

Q. But you know that in 1901 to 1905 the company's stock had been largely increased for the purchase of securities of other companies?

A. So it appeared in the evidence.

3643 Q. It had been increased from 1900 to 1905, from $39,-
078,000 authorized capital to $80,000,000 authorized capital, hadn't it?

A. And I should, come to look at it, thought that I did have a column of dividends here.

Q. That shouldn't be. It should be earnings, shouldn't it?

A. No. I have them computed here, they are marked right, but I considered the column of earnings a fairer comparison of earnings than the dividends for the last five years.

Q. Were not part of those earnings from securities of other companies?

A. These net earnings?

Q. Yes. The last period, 1901 to 1905?

A. For the last year it certainly was not, and for the previous four years I thought it was not so, I took it. I thought it was the net earnings from gas alone as given.

Q. Excluding securities of other companies?

A. I thought so. It purported to be, it used earnings from gas only.

Q. Now, take the item of assets, 1901 to 1905, ending with 1905, $47,664,984.91. That you know from Exhibit 78, to which you refer on this sheet, represents in all four items of real estate, plant, property and construction so-called, do you not?

A. Yes. The same as in the other period.

Q. But it does not include materials nor working capital?

A. Certainly not. I compared the same things in both columns.

Q. This is merely to compare the similar items at different times?

A. Yes, and that constituted over 90 per cent., if I recall right, of the total.

Q. Whatever it may be, I want to be sure. You understand the effect of the comparison?

A. Certainly. I so understood it. It meant the mains and services and meters and lamps and the manufacturing plant and holders. It did not refer to money on hand or money due for supplies on hand.

3644 Q. Now, I find down below that on this table an item "Sales at $1.25½, Exhibit 85." That refers to the number of feet sold in the years 1891 to 1895, does it, with the average rate applied?

A. Yes.

Q. And now as to the other side, "Sales at $1.00," 1901 to 1905, stated separately. This 13,283,164,000 feet in 1905 was not sold at $1.00, was it, entirely?

A. There were a small amount sold to the City at 90 cents, I think.

Q. So this would not be exactly accurate?

A. It was intended in both cases to be round figures. It would not vary half a cent. Yes, it is a round figure. It was not attempted to carry out the decimal.

Q. It included sales to the City——

A. In both cases the same.

Q. Whereas that would be sold at 90 in the latter part of the period?

A. And in the former there were sales to the City, too. I only know in round figures. Attempting to have it relate to the price to the private consumer in both cases.

Q. Now, as to the increase of mileage of mains in New York, do you know whether the increase is larger in the large sized mains than in the smaller sizes?

A. I believe it is, as I recall. Since 1884, you mean?

Q. Yes.

A. Also in the services, I think, probably. There has been no increase in services but they are larger.

Q. Now, you referred to the sales in Syracuse from 1901 to 1905 and show, if your information is correct, an increase of nearly 50 per cent. Don't you know that that period not only includes the two severe winters and the period of prosperity and the coal strike but a complete change of management of that company, particularly as to the sales department?

A. I believe there was a change of management. I don't 3645 know whether there was any great change in the sales department. I don't recall any evidence about that. There may have been.

Q. Do you mean that the net profits from sales of gas was somewhat larger than they were under the previous sales?

A. I think in my testimony I gave the total net profits as reported by the company for each period, and there was an increase.

Q. You stated something yesterday in reference to the method of collecting bills at Chicago. You understood they were paid at the offices of the Company instead of through the express offices, did you?

A. I so understood although I said I was not positive.

Q. Would the fact that I have long distance information to the effect that they have been paid, or some of them, through the express offices, modify your impression?

A. Yes, if you have that.

Q. I have it, for what it may be worth. You referred to Milwaukee. You know, do you not, that the amount sold at the lower rates in Milwaukee was very small in proportion to the total output?

A. I don't know anything about it? I have never seen any analysis of the sales in Milwaukee.

By Mr. Burr:

Q. You are referring simply to what Mr. Cowdery said in regard to it?

A. Yes, as quoted in this Council Committee's report. I do know this——

By Mr. Mathewson:

Q. In other words, that these very low rates have reference to what is called "daylight" consumption?

A. I know this. Excuse me a minute. Can I have that Committee report again? There is a point bearing directly upon 3646 that on that Council Committee's report. This statement that was read yesterday from Mr. Cowdery——

Q. Do not read it over again. Just answer the question.

A. Yes, but I want first to notice it (page 13). It is to the effect that the low price of 60 to 90 cents is for gas used for fuel. That is for heat and power and, as you say, is largely a day consumption. Now I did read before my testimony that the last edition of Brown's Directory gives over 50 per cent. of the sales of that company as day consumption. I think it was 56 per cent.—anyway, over fifty.

Q. How much of that relates to the gas burnt at $1.00 or 90 cents or 95 cents for gas stoves and fuel purposes of that kind, you don't know, do you?

A. I think it would indicate 90 or lower.

Q. Do you know what the average in Milwaukee was?

A. No, but the day consumption according to this report or this statement of Mr. Cowdery's, the day consumption would naturally be the fuel consumption. Now the fuel gas it says is furnished at 80 cents a thousand and to large users it goes down to 60, and if over half of that consumption is day consumption, then over half of the consumption ought to be less than 80 cents or a little of it might be used for light at $1. On the other hand a great deal would be used by the 60 and 70 cent users.

Q. You are simply reasoning now.

A. It is positive the average must be below 90.

Q. It is positive that the average of the gas sales in Milwaukee was below 90?

A. I would say that was a positive deduction from those statements.

Q. Well is it? Does the statement that this 60 cent grade is used in day consumption prove that all day consumption is at the 60 cent rate or anywhere near that?

A. No, but all the fuel consumption is 60 to 80. I don't say all
at 60. Eighty is for fuel and then it runs from 80 to 60,
3647 according to the amounts used. Not all day consumption is
fuel consumption, certainly.

Q. You don't know the average rate received for the gas, do you?

A. No.

Q. Isn't it true that Mr. Cowdery who describes himself, as you said, as the father of reduction of price, or whatever it was, estimates a fair price for gas in Chicago under conditions there at 98.67 cents?

Mr. **Burr**: I think you went all over that before with him, Mr. Mathewson.

A. I was very much interested.

Q. Of course you were.

A. Yes, and the company reduced to 80 cents immediately afterwards.

Mr. **Mathewson**: I move to strike that out.

Mr. **Burr**: It is the fact and you have brought it out yourself already. This is the second or third time.

The **Master**: Answer the question.

The **Witness**: Yes, I said to the question asked. Mr. Cowdery said 98 cents was all they could do, if you read it correctly. I don't remember it exactly.

Q. Won't you see if I did read it correctly, if you have any doubt about it?

A. Will you point to the exact place.

(Counsel indicates in book as requested.)

The **Witness**: 98.67 cents was Mr. Cowdery's estimate.

Q. Which included 34.92 cents for return on capital, didn't it?

A. Yes.

Q. Now you referred to Baltimore. Isn't it the fact that at

Baltimore you were testifying in favor of sustaining the valuation of a company for purposes of taxation in behalf of the city 3648 and that you did estimate the value of the property at twenty times the net profits and testified as you admitted testifying on your cross-examination?

A. Yes.

Q. And gas in Baltimore at that time was $1.10 a thousand, wasn't it?

A. Well, I thought it was a dollar, but I am not sure.

By Mr. **Burr**:

Q. What year?

A. This year, the spring of this year.

Mr. **Mathewson**: I think it was one dollar and ten cents, with provision for some cut in case of early payment or large consumption, wasn't it?

The **Witness**: I think they lately made a reduction to a dollar, but I am not sure.

Mr. **Burr**: The same plan was followed in Milwaukee, as Mr. Cowdery referred to—the reduction for large consumption.

Mr. **Mathewson**: Oh, No.

The **Witness**: No, but for prompt payment.

Mr. **Mathewson**: The arrangement was very different, as I understand it.

Q. Table 20 of page 3558, has in the final column the heading "return on the investment, per cent." What do you mean by "investment" as you used it there?

A. Purchases of the securities. Investment in stock or bonds, as the case may be.

Q. You mean return on what you concede to be the selling price of those securities?

A. Yes.

Q. Not on the structural assets or anything of that sort?

A. No.

Q. Now you figured out yesterday, taking 58/59 cents as 3649 the cost of gas and return on a certain capitalization which I think you stated to be $46,500,000?

A. Yes. Six per cent. on that.

Q. Now you took a six per cent. rate on that?

A. Yes.

Q. And all your computations on that yesterday were based on six per cent., were they not?

A. Yes.

Q. Now, that $46,500,000 does not include the franchises, does it?

A. No.

Q. And it does not include the Astoria investment?

A. No.

Q. Nor any assets of other companies producing gas which we receive but do not manufacture?

A. No.

Q. And good will?

A. No.

Q. Value of an established business?

A. Well, there was a three-million dollar margin, that was all.

Q. Yes, I understand. I am speaking now about the $46,500,000.

A. Well, I say in that there was a three million dollar margin.

Q. I understand that, but I say that did not include these various items I mentioned?

A. Except in so far as you may say the three million would cover it, but I do not intend to include anything for those.

Q. But when you said your computations, assuming six per cent. and assuming this capital, were correct, if 10.89 cents was sufficient for repairs and renewals, you referred, did you not, to our claim to an additon beyond the 10.89 representing reserves or contingent fund?

A. Yes. And beside that taking your claims on cost of operation, on taxes, &c.

Q. But excluding the item of street lamps.

A. It took everything because you did not exclude street lamps ultimately. You simply insisted that these remain in the expense account.

3650 Q. But in computing the operating cost of gas you did exclude it in getting this figure, didn't you?

A. Yes, I did.

Q. And when you take that out of the operating cost of gas and at the same time take a corresponding amount out of receipts the effect is to make the cost of gas appear small by so much?

A. But it does not effect the twenty cents per thousand feet remaining whichever way you do it, or 6 per cent. on $46,500,000 is not affected.

Q. Still my question would be answered in the affirmative: It would make the apparent cost of gas appear smaller by taking that item out?

A. Yes.

Q. You referred again yesterday to the Central Union Company and have stated, if I read your testimony correctly, that instead of one cent which you computed as the difference between the coke at the Central Union and the coke at the Consolidated Coal Gas plants per thousand, it would be 4 cents?

A. Yes. That was my testimony.

Q. And then one cent more for repairs which on consideration you thought would be allowed to the Central Union and that would make five cents?

A. Yes.

Q. So that the gap between the two on your estimate, that is between the Central Union coal gas and the Consolidated coal gas would be lessened by five cents by those two items?

A. Yes, sir.

Q. You stated, or I understood you to state yesterday, that you took out the original one cent per thousand which you computed as difference in coke in getting your figure of 48.63 cents?

A. Yes.

Q. Aren't you mistaken about that?

A. Well, repeat the question again.

(Question repeated.)

A. Yes. I did not take it out.

3651 Q. So you correct that statement, if I understood you correctly previously?

A. Yes.

By Mr. **Burr**:

Q. That is, it would make it 49——

A. No, that distributed over the entire gas sold, the whole thing would come up to about fifty cents now instead of 48.63 as per table 17. Now, all my changes bring that to about fifty cents.

Q. As appears by your statement on page 3471?

A. Yes, that is what I stated on page 3471 of the redirect testimony herein.

By Mr. **Mathewson**:

Q. In computing the value of the coke disposed of by the 14th Street plant of the Consolidated Company and by the 42d Street plant of the Consolidated did you not take the entire make of gas of those two stations?

A. In computing it per thousand feet, you mean?

Q. Yes.

A. Yes. I think so.

Q. Well, don't you know that a part of the make of those two stations, of the gas sent out of those two stations, was oil gas and not coal gas at all?

A. It was enriched coal gas.

Q. But we are getting at the coal gas product. Don't you see that you ought to have divided by the amount of the coal gas and not by the amount of the coal and water gas combined?

A. No, because I did this. I took the exact figures of sales of coke, the value of residuals, and found how much more it would amount to at the prices prevailing with the Central Union and applied that to the receipts from residuals, showing how much they would rise. I took the totals in dollars, whatever it was.

3652 Q. But you reduced it in dealing with it to the product per thousand feet of gas at the 14th and 42d Street and Central Union stations?

A. Later.

Q. And it would not be the fair comparison to divide by the Central Union gas which was all coal gas and to divide by the aggregate volume of the coal and oil gas at the 14th and 42d Street stations of the Consolidated, would it?

A. Well, I thought it would. I deducted, of course——

Q. Don't you see now that it would not?

A. Well, I don't see that, no.

Q. Supposing the oil gas at 14th Street was not as much in volume as the coal gas, do you still mean in computing the results as you did and comparing them it would have been proper to have divided by the aggregate output of the 14th Street plant, half of which was oil gas?

A. I don't think half of it was oil gas.

Q. No, but if it had been. I am getting you to the principle of the thing—it would have made the quotient just half as great, when you are dealing with coke and the results of operation of the coal gas plant and comparing that with another coal gas plant of another company?

A. Well, there was oil used at the Central Union, although not so much.

Q. Yes, there was a certain amount of oil gas in that but nowhere so large a proportion of oil gas at 14th or 42d Streets, as is obvious?

A. No.

Q. Now, don't you see in order to get a fair result you would have to exclude the oil gas from all the stations unless the oil gas amounted to the same proportion at each station in getting the comparative results of the coal gas station?

A. Well, I am not sure what allowance should be made on that question.

Q. Well, now let us go a step further. Here is a very simple proposition and let us see if you did not make an error even as it stood. You took if I understand in yesterday's testimony
3653 $152,045.32 as the Central Union receipts from coke, did you not?

A. Yes. I had omitted two thousand odd dollars.

Q. Yes. So that you were in error there as appears on page 214 of the Central Union, and the total should be, should it not, $154,817.63?

A. Yes. I have since made that computation.

Q. Now, you said that you took out cartage?

A. Yes.

Q. The cartage deducted by you was $20,935.91, leaving net $131,109.41, whereas the remainder should be, should it not, $133,881.72?

A. There would be a difference of two thousand odd dollars.

Q. Well, will you look at that computation and see if that is not correct?

A. I stated in my testimony that a correction of $2,000 should be made.

Q. Yes, and I am now indicating it?

A. I have made it here only I work- it out from the start on the basis of 100 pounds of coke and found that it changed——

Q. No matter about that. I am just getting at the result. We have now $133,881.72 as the results of the Central Union Coke Company, deducting cartage. Now, will you look at your testimony of yesterday and at page 2118 of the case before the Gas Commission, the two, and see if the results on the 14th Street Company deducting cartage were not $143,706.03 for coke?

A. I have that here, yes. I have it .08, that is all the difference.

Q. That is all right. And those figures as to the Central Union and as to the Consolidated at its 14th Street plant are figures obtained by taking the figures at which the coke delivered from the coal gas to the water gas plants was delivered, and at which the coke sold in the market was sold in the market, taking exact figures?

A. Yes.

Q. Now, if you take the Central Union net receipts of $133,881.72 and divide that by the Central Union coal gas make which 3654 appears at page 132 of the Central Union report to be 670,518,000 cubic feet, what would be the result per thousand cubic feet—19.97 cents, wouldn't it?

A. Yes. It is about that.

Q. That then is the amount realized by the Central Union according to the figures for its coke per thousand feet made. Now, will you divide the amount realized by the 14th Street plant, $143,706.03, by the amount of coal gas made at 14th Street, which is 1,360,284,000 feet, as appears on page 2415 of the record before the Gas Commission?

A. About 10.57.

Q. 10.56 and a fraction?

A. Yes.

Q. And you stated yesterday there was very little difference as you figured it out, between the price at which coke was sold in the market and the price at which it was transferred from the coal to the water gas plants, we have taken the exact figures in each instance, and we find that the Central Union realized 19.97 cents per thousand and the Consolidated 10.57 per thousand or 9.40 cents less than the Central Union, do we not?

A. 9.40 cents.

Q. And that, compared with 9.97 as you computed it the other day, if we leave out of account cartage and take gross receipts——

A. Yes, but as I stated in my testimony, that is partly accounted for by other factors than the difference in price. The number of pounds of coke per thousand feet of gas at the 14th Street station is something I want to give you in a minute.

Q. But I don't care anything about the pounds of coke. I am finding out how much we received for coke per thousand feet of make, which is the basis that you took in comparing the results of these two plants, the 14th and 42d Streets with the Central Union plants.

A. No. I claimed that the fact that you get only 953 pounds for sale at 14th Street—95 pounds I think it is, of coke for sale 3655 per thousand feet of gas at 14th Street, while you get over 124 pounds at The Central Union, confirms what Mr. George E. Wood said as to the greater yield of coke.

Q. You said that the other day and that is quite another proposition, as to what your reason is. The point is that the difference between the Consolidated 14th Street plant, and the Central Union plant, so far as coal gas is concerned, is 9.4 cents per thousand feet of make in receipts for coke, isn't it?

A. There is that difference in receipts for coke, yes.

Q. Now you have spoken as to Mr. George E. Wood's testimony.

Do you know what the cost of regenerative furnaces is, such as those used at the Central Union, as compared with those used at 42d Street and 14th Street?

A. No. I have seen such figures, but I don't remember them now.

Q. You know they cost several times more, generally speaking?

A. They cost more.

Q. And you understand that if the Central Union has a more expensive plant that while there may be a production of gas a trifle cheaper, on the other hand it will have to pay more return on capital and probably pay more in repairs?

A. There will be some more. It is not considered——

Q. And you have not weighed those things, and you are not a gas expert so that you can weigh those things, are you?

A. But I am sufficiently familiar with the business to know that it is considered everywhere a good policy in a plant of that size to have such coal charging machinery and such retorts?

Q. Do you mean to say that if in 42d Street we have not room for coal charging machinery that in the face of the statement of Doctor Humphreys and Mr. Bradley and Mr. Mayer that it would be economy to throw out our present retorts, destroy that amount of capital, and put in regenerative retorts in their places, and purchase new land so as to have more space—that that would be 3656 an economical thing to do?

A. I say that an up-to-date plant would have those economies.

Q. I am taking these plants as they now stand. Would you be prepared to rebut that statement, that it would be uneconomical in our present situation to do that thing.

Mr. Burr: The facts speak for themselves, don't they?

Mr. Mathewson: I think they do.

A. I have not had an opportunity to visit the plants yet.

Q. And you are not a gas expert, either in machinery, operation or construction?

A. Why, I have testified on that subject.

Redirect-examination by Mr. Burr:

Q. Will you explain, Professor, a little further the proposition just presented to you regarding the difference in the coke between the Central Union and the Consolidated and these various stations?

A. The fact is that they get one-third more coke per thousand feet of gas they sell at the Central Union than they do at 14th Street, and that is absolutely independent of the price of coke. That is a result of engineering conditions. The fact that they have at the Central Union a plant which yields more coke, does not use up so much coke in making the gas and leaves more for sale or for use in the water gas part of the plant, which is the same thing, that is an important point to be taken into consideration. What I was saying was in my direct testimony that the plant would produce double, as I said, if it had an up-to-date plant. The Company should, if it had an up-to-date plant, do as well as the Central Union

or the Standard or the New Amsterdam, and the difference
3657 in the price of coke does not dispute that except to modify it, as I have already modified it in my statement that of the eleven and one-half cents difference, there is about five cents of it due to repairs on that machinery and to the difference in the price of coke.

By Mr. **Mathewson**:

Q. But the point is instead of there being one cent difference per thousand feet of make, in what is received for coke sold, there is 9.4 when you come to take accurate data?

A. But there wouldn't be that—

Q. But is there not?

Mr. **Burr**: He proceeded to explain for you the reason why that does not make the effect that you claim it does. Now you are going over the ground again that you have already gone over.

Q. Is there not that difference per thousand feet of make in the price received for their coke?

A. Yes, I think so, but half of it is due to the difference in the yield of coke. The other half, roughly, to the difference in price.

By Mr. **Burr**:

Q. Just a moment ago Mr. Mathewson asked you regarding the street lamp item, but that being taken out on Exhibit 94, being a statement of operations, makes the apparent cost of gas smaller, and it is equally true that street lamps being retained in that makes the apparent cost of gas larger, does it not?

A. Yes, sir, certainly.

Q. Do you know, as a matter of fact, anything of your own knowledge about the contract with the Dominion Coal Company and the other company that you referred to?

3658 A. Not a thing. I merely read in *Moody's Manual* that there was a contract for supplying coal from that mine.

Q. So when Mr. Mathewson points his finger at you and says "don't you know?" and you say "I suppose," you mean you have no actual knowledge on the subject?

A. Certainly. No testimony on the subject came out in the Massachusetts gas hearing.

Q. Now, with regard to distribution, you were asked to compare the items of distribution as they appeared in Field's Analysis to show their bearing on the computation which you made as to distribution. Does the situation presented by Mr. Mathewson in that regard embrace the same items which you embraced in your item about distribution?

A. No.

Q. And was it therefore a fair comparison?

A. It was not.

Q. Why not?

A. Because it used the term "distribution" in the sense in which it is used in the English companies to include one of the expenses that I call distribution, and a lot of repairs on distribution system, whereas I use the word "distribution" to cover everything except repairs and taxation after the gas left the holder. Now, I do not dispute the propriety of the English terminology. I simply for convenience used a term to cover their 9.45 cents and that might have been perhaps just as properly called "distribution and management expenses."

Q. Take Field's Analysis which was handed to you by Mr. Mathewson and point out the items which were embraced in his theory and those which were left out in yours.

3659 By Mr. MATHEWSON:

Q. Your 9.45 did include management as well as usual distribution expenses outside of repairs, didn't it, as those terms are used in England and in Field's Analysis?

A. It did. And I would state that I was showing that as the city increased in size in England the same year there was no gap in the prices, that as they proceeded to larger and larger groups those distribution expenses, using the term now in its broadest sense, declined per thousand feet. I have not with me, although I have them home, all of Field's Analyses for the last twenty years to show whether it is a mistake as to London, but I have observed this that in comparing one year, 1901 with 1905, there may have been exceptional conditions. And I did notice this, there was no large increase in sales for three companies combined in London and——

Q. There ought to have been because the price was reduced.

Mr. BURR: Won't you let him proceed? I thought you had finished.

The WITNESS: While in the case of the suburban companies there was a much larger increase as brought out this morning, and in the suburban companies there was not such a marked change in the distribution cost as in the centre of the city with the three big companies where the sales remained about the same as between 1900 and 1901 and 1905, but unfortunately the total sales were not given this morning for the three London companies combined, and if that 1901 report is there I would like to read into the evidence the total sales of the three companies for the year 1901 and then for the year 1905. The total sales for the year 1901 of these three big London companies, namely,—there are only two big ones really, the 3660 Gaslight and the South Metropolitan, and the smaller one known as the Commercial. The total sales of those three companies in 1901 was 34,826,093,000 feet. During 1905, it was 36,147,679,000 feet or an increase of only 1,700,000,000 feet, which would be about 5½ per cent. There was not such a large increase as to bring out any important facts on distribution I should think.

Q. Now may I ask a question. How does that happen when there was a very heavy reduction in the price of gas from 1901 to 1905 in these metropolitan companies? There ought to have been an enormous increase, oughtn't there, to use an expression of yours in Chicago?

A. I have not even before me the change in the price of gas in London.

Q. You can see it by Field's Analysis before you?

A. Yes, but I have not looked it up and have not looked into the history of the London companies the last few years. This is one of the things I have not been able to tackle although it is part of the work I have got to tackle pretty soon, but not in connection with this case.

Q. In this 1905 Field's Analysis, page 15, it appears that the price by the Gaslight Company has been reduced something like six or eight per cent.—yes, more than that, about twelve, and the Commercial has been reduced——

A. They declined, taking the American equivalent of two cents to a penny, from 71.4 cents to 59.8 on the average for the three Metropolitan companies.

Q. That is a pretty heavy reduction and there ought to have been an enormous increase in sales. How does it happen there was not? Is it because the consumption has become so nearly saturated that they used something like 8,000 cubic feet per capita and that there was not room for much more increase?

A. Let me have the other volume, Field's Analysis for 1901, for a minute.

3661 (Book handed to witness.)

The Witness: There was an enormous increase.

Q. There was an actual decrease in sales of the Gaslight Company, which made a large reduction?

A. There was an increase of sales in the suburban companies of London.

Q. But I am talking about the Metropolitan companies?

A. Yes, but that has to be taken into account because the growth had been in the suburbs.

Q. I did not ask you anything about the suburbs.

A. You did this morning.

Q. I did not now. The morning is a long way back. I call your attention to the fact that in London they used, as has been testified, about 8,000 feet per capita, and ask you how you explain the failure to increase in view of the reduction by the three Metropolitan companies except upon the theory that they were pretty nearly saturated by gas already per capita.

A. I don't think that is the explanation at all, but I don't know what it is. I have no doubt there is an explanation that is very satisfactory, but I have not looked into it at all.

Q. You observe that the London Gaslight Company, which is the largest of all, shows an actual decrease in sales for those five years in spite of this decrease in price?

A. London may be an exception this year.

Q. You don't think the decrease in sales was due to the decrease in price, do you, by the London Gaslight Company?

A. I know there has been an increase in Sheffield, Glasgow, and other cities, and a large increase. There has been an exceptional difference in London and I don't know what it is.

Mr. Mathewson: It is saturated, isn't it.

Mr. Burr: Is that your claim, because of the point of
3662 saturation having been arirved at in London?

Mr. Mathewson: The Professor is on the stand. I am not.

The Witness: There is no such thing as a point of saturation in that matter.

By Mr. Burr:

Q. While you are here let me call your attention to the illuminating power as called for by these companies that you referred to this morning, as the same appears on page 2 of Field's Analysis, and the amount that is prescribed and the amount that is actually supplied in candle-power. I will read it:

	Gas Light. Prescribed.	Supplied.
Metropolitan (City of London)	16 Sperm Candles,	16.48
Commercial	14 Sperm Candles,	14.90
South Metropolitan	14 Sperm Candles,	14.60

You were asked with regard to the candle-power on your recross-examination by Mr. Mathewson. Do you desire to make any statement in that regard?

A. I do.

Q. Please proceed and make it.

A. The question was asked whether I knew as to the extent to which the Consolidated was below 20 candle-power during the last six months of 1904. I find that of all their stations there were only three days in which they were below 20 and that was only, in each case, in one station and that was only a trifle below, less than a candle if I recall aright. Now, as to the year 1905, the last six months of the year 1905, I was asked whether I knew as to whether the New Amsterdam and Standard were below the required amount in test.

3663 Mr. Mathewson: No, I asked you about the Consolidated.

The Witness (continuing): Well about the New Amsterdam and the Standard. I find they were not below the requirement of 22 candle-power and I find that not only is that the case, but I have marked the times when they were even below 23 candle-power, and I find that there was no time during July, August and September. In October there was one test in which it was 22.59 in the New Amsterdam, on October 26th; and 22.92 October 31st.

In November: On November 3rd one test of the Standard 22.86.

December: December 4th, Standard, 22.92; December 5th, New Amsterdam, 22.22, Standard 22.06. On the 6th, Standard 22.42; and that was all. Those are the only cases in which it even went below 23—in the cases of the New Amsterdam and Standard.

Now, as to the Consolidated during the last six months of 1905, I was asked first if there was any case in which they fell below 22. There was one day, September 26th, in which the Station No. 3, was 21.53. That was the only time in which it fell below 22. Now I have noted the days in which the Consolidated was below 22½ in any one station.

Q. Why not below 23 as you did with the New Amsterdam?

A. I will give that in a minute. First below 22½. One station, August 18th, when it was 22.10; and two stations, August 28th; one station, September 2nd, 14th, 26th and 30th; two on October 7th, one on October 9th, one on October 21st, one on October 25th. On November 22d, one; on December 5, three; on December 6, two; on December 7th, one; on December 8th, one; on December 26th, one. It was below 22.4 however, on only a portion of those days.

3664 Now, as to its being below 23. During July it was not below 23 at all, when the average of the month was 25.10. I think on the last day of the month, one station was 22.94.

Now, in August, below 23, one station on August 1st, 22.86; August 14th, 22.63; August 16th—this is only one station in each case—22.7; August 17th, 22.68; August 18th, 22.10; August 19th—two stations—22.90 each; August 21st, one station, 22.72;

August 28th, 22.06; 22.12; 22.84.
August 29th, 22.33; 22.26; 22.65.
September 2d, 22.29—one station.
September 5th, 22.93.
September 14th, 22.06; 22.66; 22.50.
September 15th, 22.66; 22.04.
September 16th, 22.36.
September 18th, 22.50.
September 20th, 22.65; 22.84; 22.69.
September 23, 22.38.
September 25, 22.12.
September 26th, three stations were below 23—22.70; 22.72; 21.53.
September 27th, 22.88; 22.82; 22.84.
September 28th, one station, 22.50.
September 29th, one station, 22.70.
September 30th, one station, 22.49.

The low station seemed to be station 3 in most all those cases where there was only one.

October 2d, 22.66.
October 4th, 22.91.
October 6th, 22.64.
October 7th, 22.35; 22.86; 22.05.
October 9th, 22.81; 22.05.
October 10th, 22.78; 22.50.
October 17th, 22.44.
October 21st, 21.37; 22.80; 22.90.
October 23d, 22.96; 22.52.
3665 October 25th, 22.30.
October 28th, 22.80.
October 31st, 22.68.
November 1st, 22.56; 22.60.
November 6th, 22.75; 22.93.
November 8th, 22.88.
November 9th, 22.74.
November 10th, 22.61; 22.68.
November 11th, 22.94.

November 17th, 22.50; 22.95.
November 20th, 22.40; 22.74.
November 21st, 22.72; 22.56.
November 22d, 22.70.
November 25th, 22.96.
December 4th, 22.56.
December 5th, 22.46; 22.16; 22.12.
December 6th, all five stations, 22.56; 22.95; 22; 22.71; 22.03.
December 7th, 22.43.
December 8, 22.48.
December 13, 22.58.
December 15, 22.76.
December 16th, 22.88, 22.98.
December 19th, 22.92.
December 23rd, 22.70.
December 26th, 22.42.
December 27th, 22.60, 22.72.

In other words, it will be observed that they mostly came in October.

Q. What did?

A. Below 23, did not come in the summer months, neither did they come so much in December. They came more in September and October and two or three days in November. The fifth and sixth of December a good many below 23; I gave in each case the number of stations.

3666 Q. And now, have you finished the tabulation of the cost of the plant including the real estate as appears, as you contend, from Yalden's statement?

A. No, I have not finished that.

Mr. Burr: When you have finished that I will ask leave to submit it, as I stated this morning.

By Mr. Mathewson:

Q. The period which you took did not include the coldest part of the winter, that is, January, February and March, did it?

A. No.

Q. And you know that last winter, do you not, 1905-6, was one of the most open and warm winters on record?

A. It was warmer than the average, I believe.

By Mr. Burr:

Q. Do you know?

A. Well, I have that impression that it was warmer than the average. I don't know about it making any record in the matter.

By Mr. Mathewson:

Q. A very warm winter, wasn't it, as winters go, in your experience?

A. I can only go as far as to say that I think it was warmer than the average.

At 4:30 o'clock P. M. adjourned to October 31st, 1906, at 10:30 A. M.

3667 UNITED STATES OF AMERICA,
Southern District of New York, ss:

I, John A. Shields, Clerk of the Circuit Court of the United States of America, for the Southern District of New York, in the Second Circuit, do hereby Certify that the foregoing (Vol. 5) pages, numbered from 2953 to 3666 inclusive contain a true and complete transcript of the record and proceedings had in said Court, in the cause entitled Consolidated Gas Company, Complainant, Appellee, against Julius M. Mayer, as Attorney General, *et al.,* Defendants-Appellants, as the same remain of record and on file in my office (Vol. 5)

In Testimony Whereof, I have caused the seal of the said Court to be hereunto affixed, at the City of New York, in the Southern District of New York, in the Second Circuit, this 15th day of May, in the year of our Lord One Thousand Nine Hundred and eight and of the Independence of the said United States the One Hundred and thirty-second.

[Seal of U. S. Circuit Court, South Dist. New York.]

JNO. A. SHIELDS, *Clerk.*

[Endorsed:] United States Circuit Court of Appeals for the Second Circuit. —— —— *vs.* —— ——. Transcript of Record from the Circuit Court of the United States for the Southern District of New York.

3667½ Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucien L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Wednesday, *October* 31, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr and Mr. Kirby.

3668 Mr. Burr: I call the attention of the Master to the fact that at the time Dr. Marks was withdrawn from the stand it was with the view of his subsequently examining as an expert the plants of the company with a view to testifying as to their value. Matters have so shaped themselves that Dr. Marks has confined himself to directing the examination now proceeding of the books of the company, while other engineers, having examined the plants, will testify as to their value. Mr. Mathewson at the close of his cross-examination, stated: "Now I have not cross-examined Dr. Marks on the cost of gas and on the matter of value of plant and its various items, which I understood I might not take up until he has completed his evidence on those subjects, and there may be a few more questions on those other features that I have not covered, but they will not be extensive." So that Dr. Marks is here this morning for the purpose of having Mr. Mathewson complete his cross-examination. Of course, as the result of the report of the engineers, Dr. Marks may have some other testimony as to the facts brought out by that examination.

Mr. Mathewson: And how about the cost of gas?

Mr. Burr: He has given his testimony on the cost of gas.

Mr. Mathewson: And does not intend to give any further testimony on that subject?

Mr. Burr: No, not on that subject. I say we may make whatever comments we desire to make on the facts, both as they are revealed by the report of the accountants and of the engineers.

Mr. Mathewson: I understood I was not to cross-examine him until this examination had been completed of the books, and he had testified as to the cost of gas, as he might argue from what was thus ascertained.

3669 That was the only reason for the adjournment, so far as that was concerned, on the cost of gas.

Mr. Burr: The idea was that he was to testify as an expert as to the value of the property. Now he is ready to be cross-examined as to the cost of gas and along his direct-examination as far as you may think proper.

The **Master**: Manifestly he cannot be cross-examined to a finish now and then recalled on another occasion and then further examined in chief.

Mr. **Burr**: No, but all the witnesses who have testified as experts for the city, so far as the cost of gas and structural value is concerned, have always made the reservation that the bringing in of the results of these examination- may necessitate them either modifying their views or testifying further in that regard.

Mr. **Mathewson**: If I cross-examine now and continue on that subject, I certainly shall expect anything presented hereafter to be new matter by a recalled witness, and not compel me to retraverse the ground, Mr. Master.

The **Master**: That is right.

William D. Marks resumed.

Cross-examination by Mr. **Mathewson** continued:

Q. I will first take up your computations on the subject of the cost of gas (page 2301). You take the total of 74.81 cents shown on Exhibit 94 as total expenses of the company in the production and distribution of gas and make therefrom certain deductions. In the first place, to reach the operating cost of gas you deduct fixed charges, 7.32 cents, do you not?

A. I do.

3670 Q. You find no conflict between you on the one hand and Messrs. Addicks and Humphreys on the other in that regard, do you?

A. I think they both deducted it.

Q. Now you also deduct the item of street lamps which has been shown to be the expenditure in the maintenance of the street lamps that the company pays out in excess of certain receipts. That, you understand, is an expenditure that the company makes preliminary to its delivering bills for the gas, that it furnishes to the city and collecting them, do you not?

A. I do.

Q. And it makes no difference in effect whether you include this in the operating cost of gas and also include it in receipts, or whether you deduct it from the operating cost of gas as you deduct a similar amount from receipts in computing the net result to the company?

A. I have had quite a number of street-lighting contracts. Would you allow me to explain just how I have been in the habit of handling those accounts?

Q. No, I do not care so much about that, Doctor, but if you will just give me answers to my questions I think we will get through much more rapidly.

A. It makes a good deal of difference.

Q. Well, let us see if it does. If you include in the operating cost of gas $289,000 of street lamp expenditure for maintenance, then you have a corresponding receipt, have you not, on the other hand, when you come to consider the receipts of the company?

A. If you have received the money.

Q. Yes, if you have received the money. Well, you know in the present case the money is charged, but not yet paid to the company?

A. I don't know. I have not proceeded sufficiently far in the examination of the books to ascertain.

Q. You observed from the testimony that the company
3671 credited itself in receipts for all the amounts that it has
charged to the city exactly as though they had been received. Did you not observe that in your reading of the testimony?

A. I have noticed it in some instances. Of course, I cannot state as to the fact.

Q. If that be a true statement, then the company would have a receipt on the other hand to balance this expenditure for street lamps, would it not?

A. On the books.

Q. Yes. And on the other hand, if you deducted street lamp expenditure from operating cost of gas, you must at the same time deduct a corresponding amount from the receipts on the other side of the ledger, must you not?

A. That would not be good bookkeeping. You might do that.

Q. Well, however you treat it, when you come to take the difference between expenditures and receipts and find what is remaining for dividends and interest, the result is the same, whichever way you treated it, whether you included the expenditures for maintenance of gas lamps in expenditures and included a similar amount in receipts, or whether you excluded that amount both from receipts and expenditures, there would be no difference in the net, would there?

A. You could add any amount, large or small, to the credit and debit sides, and the difference between the two would be the same.

Q. Have you read the testimony of Professor Bemis on that subject?

A. No. You will pardon me for saying that I am entirely in accord with Professor Bemis, but my point of view as a constructive engineer would prevent me from undertaking a discussion of the subject after a similar method.

Q. Now, let us take repairs to gas stoves. You have ex-
3672 cluded in addition to the items fixed charges and street lamps,
being 7.32 and 2.18 cents, respectively, the further item of .42 on account of repairs to gas stoves. On what theory do you exclude those?

A. Referring *from* item 47, on page 2301 to page 2303, Exhibit 224, page 759, we find the gas stoves rent for the calendar year to be $122,322.60; and referring to item 47, Exhibit 94, repairs to gas stoves, we find the expense to be $55,954.35. The difference between these is $66,368.25, or one-half a cent per thousand cubic feet.

Q. Well, you have got a little ahead of me, Professor; you will observe that you deduct .42, being the amount of repairs for gas stoves 47 in Exhibit 94?

A. Yes.

Q. Now, I want to know why you deduct repairs to gas stoves in reaching the operating cost of gas?

A. In taking up the cost of gas I took it first according to the usual method, which individually I should adopt, of rejecting independent accounts which could be closed at the end of the year by the direct transfer of balance to profit and loss account.

Q. Supposing the repairs to gas stoves had exceeded the amounts received for stove rent, or supposing there had been no stove rents, as there are no stove rents in the case of a great many companies, wouldn't you include repairs to those gas stoves, the same as repairs to any other consumer's apparatus, in the operating cost of gas?

A. No.

Q. Why not?

A. I would regard and set apart the gas stove business as something which could better be transacted by a plumber's department attached to the concern.

Q. Well, it would still be a part of the concern if it was a plumber's department attached to the concern, and its receipts and disbursements would be part of the business of the company, wouldn't they?

3673 A. They would, if the capital was furnished by the company, but it is an account which can be closed, and would be closed by me, by a direct transfer to profit and loss account at the end of the year.

Q. Well, however it may be treated from a bookkeeping standpoint, assuming there were no gas stoves rented by this company at all, and it occupied the position of other companies which do not rent gas stoves, would you not say then that the expenditures that the company made in caring for the apparatus of the consumer would be a proper expenditure of the company, the same as the expenditure of the company in taking care of the consumers' tips in ordinary burners?

A. Personally, I should not, but I would refer the matter to the Board of Directors for instructions on that subject.

Q. Well, as a matter of fact, the company, and all the companies you know, expend certain moneys in repairs of the burners of the consumers, and in repairs of the burners of gas stoves, for the purpose of encouraging the consumption of gas by the consumer?

A. Any wise company would do that.

Q. Then it is a fair thing to do that, of course, if a wise company would do it?

A. I am referring to the gas tips at the burners on stoves. Then, in addition to that, you know that the English companies, at least—I may be wrong—I think take the result of their stove business, whichever way it may go, and introduce it into the annual results.

Q. Well, we are coming to that later. And the result might be reached if they deducted the stove rent, but I have not got to that point. I am assuming there was no stove rent to deduct. I am asking you whether the expenditure for repairs of the burners on gas stoves in order to encourage the consumption of gas would not be just as appropriate an expenditure as the repairs of the burner on the ordinary flame in a consumer's house?

3674 A. In the case of the gas tips, which I presume you mean, for jets?

Q. Yes?

By Mr. **Burr**:

Q. On the gas fixtures?

A. On the gas fixtures it is an ordinary expenditure of quite a small amount, sufficiently inconsiderable to warrant a manager in going ahead without making it a serious matter of discussion before a Board of Directors. In the case of gas stoves I should say that the matter of gas stoves should be decided authoritatively.

By Mr. **Mathewson**:

Q. I am assuming you are the whole board of directors and that you have full power to make a decision, or that the power has been delegated to you. Would it not be true, in that case, that any reasonable expenditures of the company for taking care of the burners of the consumer in his gas stove you would consider a proper charge in your operating expenses just as much as expenditures made for taking care of his tips in the ordinary burners? Putting it up to you?

A. Putting it as an entirely personal matter, Mr. Mathewson, I come here with an absolutely open mind and desire to be entirely frank.

Q. I am proceeding on that presumption, Professor.

A. Yes, and I wish to be as brief as possible, too. It seems to me that the establishment of a stove department, connected with which would be proper inspectors, and the operation of it with a view to giving satisfaction and selling as much gas as possible, with a desire to come somewhere near even at the end of the year, is an entirely proper action on the part of the English companies.

3675 Q. Well, would it not be a proper action on the part of the American companies, then, including particularly the Consolidated Gas Company of New York?

A. I could be much more positive if I had not heard the hardest sort of arguments on both sides in actual practice, and while personally I should advocate what I have just stated I would not insist upon it with a board that was opposed to it.

Q. Don't you know that those repairs are included as part of the operating expenses in the form of report required by the Massachusetts Gas Commission and also by the New York Gas Commission?

A. I know it is put in.

Q. And you lay great stress upon the English companies' practice and cited Field's Analysis?

A. Yes.

Q. Stating you approved their methods? Now, won't you look at Field's Analysis for 1905 and see whether "stove repairs" is not included under the distribution expenses in English companies?

A. Pardon me, before I answer this, for saying I used the English method for the purpose of entirely avoiding any imputation of a theory on my part, accepting their methods not because I approved or disapproved of them, but because they were precedents established by years of usage, and on page 2303 of my testimony I fully stated the fact that the results of the gas stove business under the English methods were introduced into the cost of gas and showed the same in my segregation.

Q. I am coming to that later, Professor. I am merely asking you now whether "Stove Repairs" under that exact name are not included in the English system, as shown in Field's Analysis under "distribution charges," which are part of the operating cost of gas?

A. On pages 4-11 the amount of stove repairs per one thousand sold is given by companies.

3676 Q. The simple question is, Doctor, whether the "Stove Repairs" under the English System of accounting, as shown in Field's Analysis, to which you have often referred, are not included as part of the distributing expenses in the operating cost of gas?

A. Distributing charges, you mean?

Q. Yes, call it distributing charges.

A. Yes.

The Master: Then the answer is "Yes."

The Witness: Yes.

Q. Now you have also deducted interest on consumers' deposits?

A. Yes.

Q. .39——

A. Item 54, page 2301.

Q. Yes; .39 of a cent. You understand that that represents money actually paid, do you not, by the company as interest on consumers' deposits?

A. It is so stated.

Q. Well, as far as your information goes now upon the facts which you had before you when you gave your testimony in chief, that does represent actual payment?

A. Well, I understood that statement to be made by the Consolidated Gas Company.

Q. Yes, exactly. And is there any reason, therefore, why it should not go into the operating cost as well as any other expenditures?

A. It is an account which should be closed by a direct transfer to profit and loss account.

Q. Well, you might transfer taxes or anything else from this Exhibit 94 to Profit and Loss Account and set off against it an amount of receipts sufficient to cancel it, but what I am asking now is whether it is not a proper expense in the manufacture and distribution of gas, and should it not be counted as an expense, however it may be treated in bookkeeping?

A. I should not count it as an expense, because it is not 3677 necessary for the company except for the purpose of insurance against bad debts.

Q. Well, consider bad debts. You have allowed bad debts as part of the proper expenditures or credits in the operating cost of gas, as shown in Exhibit 94, have you not?

A. With the qualification that a proper unavoidable percentage of bad debts is frequently found, and——

Q. Well, you don't find that the amount of bad debts that the Consolidated Gas Company has incurred has been criticised or excluded by any expert either before the Stevens Committee, the Gas Commission, or here so far?

A. I would have to defer an opinion on that point, now.

Q. No, but do you find that they have been excluded by anyone either before the Stevens Committee or the Gas Commission, or here, so far as you have read the testimony, and you said you had read it all?

A. I do not, no.

Q. Well, if you did not take deposits from consumers to secure the company, the probability is that the item of bad debts would be increased?

A. That is the theory.

Q. So that you would increase the item of bad debts, which is chargeable in the cost of gas, if you did not take deposits upon which we had to pay .39 of a cent in interest. Why, therefore, isn't it prudent to take deposits and pay interest on them, amounting to such a small figure, only .39 of a cent, in order to keep down the amount of bad debts which would otherwise be charged in to the operating cost of gas?

A. It is a theory, and has not been proved by tests.

Q. Why shouldn't that amount be included if it does tend to reduce the amount of bad debts?

A. Because it is not proved that it would reduce the amount of debts.

3678 Q. Don't you think it would have that tendency, Professor, in a city like New York? Don't you think the taking of deposits from irresponsible consumers covering a month or two of bills would tend to decrease the amount of bad debts that the company would incur during the year?

A. The theory is that it would wipe them out altogether.

Q. Well, we won't go to that Utopian point, but don't you think it would have a tendency and an effect to reduce the amount of bad debts that the company would otherwise incur?

A. It would appear to me as if it should do so.

Q. Well, now you speak of it as an insurance. You have not included the item 65 in Exhibit 94, the .41 of a cent, have you, in your computations?

Mr. Burr: You mean in the rejected items?

Mr. Mathewson: Yes; item 65.

Q. You have not excluded that item of interest?

A. No, I have stated though that it was doubtful, awaiting the result of my investigations.

Q. I am assuming the expenditure was made for insurance, and that it was proper. If that item was made for insurance at that figure, then it is a proper item to be included, isn't it, in the operating cost of gas?

A. That is, for proper insurance.

Q. Yes.

A. It has been so considered as against fire or accidents, or anything of that sort.

Q. And you have not claimed you ought to exclude from the operating cost of gas any proper payment for fire insurance, have you?

A. No, I have not.

Q. Because, if we did not have insurance, and the buildings burned and we had to replace them, then that would mean a considerable charge for replacement which would go finally against consumers of gas. Now, in the same way, if they pay .39 of 3679 a cent per annum on consumers' deposits as an insurance against bad debts—I use your own term insurance in that connection—why isn't that a proper charge—an insurance charge, if you please, which likewise should be credited in the cost of gas?

A. Because you have the use of the money of the consumer, presumably in a much more profitable form, yielding larger profits than the rate of interest that you pay on it, and for that reason it classifies itself with the money raised on bonds, which, according to your own expert, is excluded without any comment whatever.

Q. That is another point. I am merely getting at now the propriety of the expenditure. You do not question the propriety of the expenditure of .39 of a cent per annum for interest on consumers' deposits, do you, in view of the effect of that policy in reducing the amount of bad debts which would otherwise be charged in operating expenses? No matter how it may be taken care of ultimately, I am asking now the question simply?

A. I have always taken the ground that a consumer that required a deposit in order to be safe should not receive any interest, but I understand that in this case the State laws force the payment of interest.

Q. Well, then, in this case you would say that an expenditure of .39 of a cent, however you may treat it in the books, was a fair expenditure as an insurance against an excessive amount of bad debts, wouldn't you?

A. It is a little difficult to make the matter clear, because it is a matter that admits of a good deal of argument both ways.

Q. Well, I am merely asking you for a conclusion.

A. It is difficult in ordinary business to jump at a conclusion in that way.

Q. Assuming that this expenditure of .39 of a cent is made in pursuance of a special law, which requires payment upon con- 3680 sumers' deposits, would you not consider that a wise expenditure as an insurance against an excessive amount of bad debts?

A. After stating that it finds its compensation in the actual use of cash, as do fixed charges, I would say that it is a wise thing to obtain an insurance against unsafe consumers.

Q. Do you know of any company that does not pay interest on its consumers' deposits?

A. Yes, but they are all small ones.

Q. None operating in a large city?

A. None of the size of a metropolitan company.

Q. Now the other item that you deduct from the operating cost of gas is 10 cents contingent expense. You understand that that 10 cents is intended to cover and does cover the actual expenditure for renewals and replacements as well as contingent or reserve fund, do you not?

A. It is so stated.

Q. And after deducting the 10 cents for contingent expenses, you have added to take its place the actual expenditures for repairs and renewals which you state to be $194,000. Now, as a matter of fact, isn't that $194,000 the amount of the expenditures for replacements and renewals for the nominal year ending October 31, 1905, instead of for the calendar year 1905, which is covered by this Exhibit 94 with which you are dealing?

A. On page 2304 of the testimony, item 67, I state the question. I would like to reserve my reply to that question until the present examination of the accounts is had.

Q. Oh, no, I am not examining you on the present examination of the account. I am examining you on what you testified to respecting these matters.

The MASTER: Repeat the question, Mr. Stenographer.

3681 The STENOGRAPHER (reading): And after deducting the 10 cents for contingent expenses, you have added to take its place the actual expenditures for repairs and renewals which you state to be $194,000. Now, as a matter of fact, isn't that $194,000 the amount of the expenditures for replacements and renewals for the nominal year ending October 31, 1905, instead of for the calendar year 1905, which is covered by this Exhibit 94 with which you are dealing?

A. On page 2304 I so state.

Q. Well, that you state amounts to only 1.45 cents and you substitute that 1.45 cents in place of the 10 cents for renewals and contingent expenses. Now, did you not ascertain in reading the testimony that the actual expenses for renewals and replacements in the calendar year 1905 were 2.12 cents instead of 1.45 cents?

A. On page 2312 of Mr. Carter's testimony, "it would appear as if the actual replacements for the twelve months ending October 31st, 1905, amounting to $194,666.87, or 1.45 cents per thousand cubic feet sold for the calendar year, did not corroborate his statement of 2.12 cents for a calendar year overlapping only about two months." That is reversing the operation, $284,000 approximately. That was brought out very clearly.

Q. Did you read Mr. Carter's testimony after the introduction of Exhibit 94, where he expressly gave the amount of renewals and replacement for the calendar year 1905 and stated it was 2.12 cents, or considerably more than it was for the nominal year?

A. I recall very distinctly Mr. Addicks' use of that.

Q. Mr. Carter's use, I think you mean?

3682 A. No; Mr. Addicks' use, laying more stress on Mr. Addicks' testimony than that of the others, and for that reason referred to in my own testimony.

Q. Why did you take this $194,000 replacements for the nominal year ending October 31st, 1905, instead of replacements for the calendar year ending December 31st, 1905, when Exhibit 94 covers the calendar year and not the nominal year?

A. Because there have been so many different statements with regard to a contingent account following one another that it was necessary to defer final and accurate statements until the investigation now in progress was completed.

Q. Oh, well, but you were testifying, Professor, at that time from facts and figures which were then before you and you were put on the stand by your own counsel and not by me. Now I want to know, so long as Exhibit 94 with which you are dealing covers the calendar year, you did not take the statement of replacements and renewals for the calendar year which amounted to 2.12 cents instead of renewals and replacements for the nominal year ending October 31st, 1905, which amounted to only 1.45 cents?

A. Because both these amounts appeared to me to be doubtful, and I thought one was as good as the other.

Q. Do you find in the testimony anywhere, and if so please point it out, that the expenditure for renewals and replacements for the calendar year of 1905 were anything else than 2.12 cents per annum?

Mr. BURR: That is not the point, Mr. Mathewson, excuse me.

Mr. MATHEWSON: I think it is.

Mr. BURR: The Doctor has explained that the difference between $194,666.87 and $284,700 for the two months appears to him to have been so singular that he assumed the small amount, as I understand it.

3683 The WITNESS: That's it exactly.

Q. Yes, you assumed a small amount in that case, although the sworn testimony was that was not the correct amount and included that in place of the 10 cent-, did you, Professor?

A. I am sorry to repeat it so often, but I have been forced into the position of doubting the statements made.

The MASTER: That is all right, and you have a right to state it. The question is whether you did in your computation assume it as Mr. Mathewson asks? Whteher you did or did not, that is all.

The WITNESS: I assumed it was not probable.

Q. And so in spite of the sworn testimony that the replacements for the calendar year were $284,000 instead of $194,000, and in spite of Mr. Carter's explanation in the testimony as to how that was made up, you still took the nominal year, 1.45 cents, instead of the calendar year, 2.12 cents?

A. I did.

Q. And you think that is a fair thing to do, do you, Professor?

A. It was the best I could do.

Mr. BURR: And the accounting will show whether it is correct or not?

Mr. MATHEWSON: Yes, the accounting will show whether it is correct or not.

Q. Did you take any other items here for the nominal year instead of for the calendar year except this item of renewals and replacements in your computation?

A. I don't recall that I did. There were some cases where it was rather hard to take——

Q. Now, I would like to have you turn to the testimony of Mr. Carter in reference to the items of replacements and renewals $284,000 for the calendar year 1905 and point out what there is

3684 there that causes you to doubt the accuracy of the statement. A. Can you refer me to the page?

Q. No, I assumed you considered that very carefully before you made such a discrimination as that.

A. I know, but my memory is not a numerical index.

Q. But you must have a memorandum of it, it must have been very carefully considered by you?

A. It was. I confess I have forgotten the page on which Mr. Carter made this statement.

Q. I would have had it for you but I assumed it was merely an oversight and not a deliberate action on your part.

A. On page 624 the question is asked, "What was the actual depreciation for the year 1905, per thousand as shown by the books of the Company? A. 2.12 cents per thousand."

Q. Whose testimony is that?

A. This is Mr. Carter's testimony.

Q. And you found, too, that in the exhibit showing repairs and renewals from 1884 down to date that the statement appears, "renewals, 1905, 2.12 cents," didn't you?

The Master: What Exhibit is that?

Mr. Mathewson: State's Exhibit L.

Q. As you can figure out from State's Exhibit L it is 2.12 cents, isn't it?

A. This all comes back to me now. The amount of $194,666 was for the yhole wear ending October 31st. The amount of $284,700 was also for that whole year ending December 31st, so that really it was November and December of 1904 against November and December of 1905, and one appeared as good as the other to me, and being in doubt, I used the first stated, which is $194,666.

Q. Why didn't you use the other items for the nominal year such as bad debts and expenditures for insurance, if the items appear as good in one case as in the other, instead of singling this item out?

3685 A. Because the other accounts were not hidden inside of a ten-cent per thousand estimate at the outset.

Q. Do you mean to say they were hidden when Mr. Carter testified before he was turned over for cross-examination at all expressly what the details of the ten-cent item were and explained a part of them were contingent or reserve and a part of them actual expenditure? Do you consider that as hidden?

A. Perhaps "included" would be a better phrase.

Q. Now, as a matter of fact, did you from State's Exhibit L take the pains to compute and find that the renewals for the year 1904 amounted to 3.46 cents and for 1902 3.99 cents, and so on, practically every year greater than even the 2.12 cents which Mr. Carter stated to be the expenditure for the year 1905? Did you make that computation from that exhibit?

A. I gave most careful attention to the matter of renewals from beginning to end, so far as I was able, for every year since 1884 with the result of being utterly in doubt as to each and every statement.

Q. Didn't you find that in substance every year the expenditures for repairs and renewals exceeded even the 2.12 cents which Mr. Carter stated they were for the year 1905?

A. I cannot say that, but as a matter of fact, to my own judgment they appear to me excessive throughout.

Q. Well, assuming that they were greater than 2.12 cents for pretty nearly every year from 1884 down, you still thought that you ought to reduce them to 1.45 cents, which they appeared to be for the nominal year ending October 31st, 1905?

A. I did.

Q. Now, as to the difference between $284,000 for the calendar year and $194,000 for the nominal year, a difference of only $90,000, might it not very well be that replacements and renewals in two months would be made exceeding that difference in a company the size of the Consolidated?

3686 A. I should much prefer to testify from the facts, which we are trying to find now, but while such a thing was possible, it did not appear regular to me.

Q. Are you able to point out anything in Mr. Carter's testimony, or the testimony of any other witness of the Consolidated Gas Company, which led you to cast reflection on the $284,000 item? I now give you an opportunity to do so, if you can?

A. I explained as fully as I was able my reasons for that selection. I do not think I can add anything to it.

Q. In addition to the items to which I have called your attention, you proceed to deduct certain items appearing at the bottom of page 2301 and the top of page 2302, as to the taxes on income from other companies' securities, and the taxes on dividends in excess of four per cent. on $38,643,590.14 stock invested in securities of other companies. You found that those items were deducted both by Dr. Humphreys and Mr. Addicks, did you not, in their computation?

A. I recall, I think, that they did so.

Q. Now, you differ from them in that you exclude from the operating cost of gas taxes on $41,356,409.86 of the stock of the company that was invested in its gas business. On what theory do you exclude that?

Mr. Burr: That was claimed to be invested in its gas business.

Mr. Mathewson: Well, put it that way.

A. This does not read in its gas business. It is invested in gas business.

Q. Well, you understand, don't you, that above is the amount which appears to be invested in securities of other companies, whether gas or electric companies? Didn't you make an examination to ascertain whether that was so or not?

3687 A. I have a memorandum here somewhere.

Q. You took these figures, didn't you, from Complainant's Exhibit 80 as to the amount invested in the gas business and invested in the securities of other companies?

A. No, I did not, but I see this figure, $41,356,409.86, is confirmed in Exhibit 80 as a liability in the form of a stock.

Q. Where did you get the figures to which I have referred?

A. I was trying to hunt it up. I thought I had it in my portfolio here.

Q. You do not recall, do you, Professor?

A. Yes, here it is.

Q. Now, where did you get the figures to which I have referred?

A. The memorandum which I have in my hand shows for 1905, charge to cost of making gas, $965,843.88. The taxes charged on real estate are $179,778.95; on personal property, $88,839; on special franchises, $406,909.23; on mains, pipes, and so forth, private, $14.91; and on the income from securities of other companies——

Q. Income from gas business, $70,538.02?

A. No, you haven't it there. Income from other securities, other companies, $5,257.48; and income from gas business, $70,538.02; taxes on dividends in excess of four per cent. on $38,643,590.14; stock invested in securities, $57,965.39; taxes on $41,356,409.86, stock in gas business, $62,034.61; interest on unpaid taxes $94,506.29; total, as stated, $965,843.88.

The Master: What you have read is just a reproduction of the statement that appears on the foot of page 2301 and 2302?

The Witness: Yes.

Q. Now, you included in the operating cost of gas all of the items which appeared on page 3301 and excluded all that appeared on page 2302?

A. Yes.

3688 Q. And it appears that Dr. Humphreys and Mr. Addicks also excluded the first two items on page 2302. Now I asked you on what theory you excluded the taxes on $41,356,409.86, which constitutes the third item on page 2302.

A. On page 2301, you will observe, is segregated the taxes on real estate, the taxes on personal property, the taxes on special franchises, the tax on mains, pipes and so forth, and the taxes on income from gas business. Those are segregated on page 2301 and amount to $746,080.11. On page 2302 I segregated, first of all, taxes on income from other companies' securities——

Q. I see—we all have that before us, and we see the $219,763.77 which is stated on that page.

A. And taxes on dividends in excess of four per cent. on all stocks both the $38,000,000 and the $41,000,000, and interest on unpaid taxes is taken out.

Q. But the $41,356,409.86, so far as any evidence in this case goes, was stock invested in the company's own business and not in securities of other companies. Now I ask you on what theory you exclude from the operating cost of gas the taxes on this $41,356,409.86?

A. Because it appears to be a tax on the profits.

Q. Does it?

A. In excess of four per cent.

Q. Supposing it is a tax on the profits, if it is a tax against the corporation, and the company does not make the laws, why should not the company be entitled to charge in the operating cost of gas the tax so computed?

A. To me it appeared a proper charge to profit and loss and not the cost of making gas.

Q. You understand, don't you, that that is not a tax assessed against individual stockholders and that it is no lien against individual stockholders, and could not be collected from individual stockholders, but is a tax against the corporation?

A. It appears to be paid by the company.

3689 Q. Well, if it is a tax against the corporation, is it not a proper charge in the operating cost of gas?

A. Not all taxes, no.

Q. Is not this tax?

A. It did not appear to be to me.

Q. I will read you the section of the act, being Section 186, I believe, of the Tax Law, which reads as follows: "Franchise tax on waterworks companies, gas companies, electric or steam-heating, lighting and power companies. Every corporation, joint stock company or association formed for supplying water or gas or electricity or steam heat and lighting or power purposes, shall pay to the State for the privilege of exercising its corporate franchises or carrying on its business in such corporate or organized capacity in this State an annual tax, which shall be .5 of one per centum upon its gross earnings, from all sources within this State, and 3 per centum upon the amount of dividends declared or paid in excess of 4 per cent. upon the actual amount of paid-up capital employed by such corporation, joint stock company or association." Now, assuming that this amount of $41,356,409.86 is employed in the gas business and that this tax is a tax to the State for the privilege of the exercise of its franchise by the company, is there any theory upon which that can be excluded fairly from the operating cost of gas?

Mr. Burr: Is not that the very question this Court is going to decide?

A. I can only say in reply to that that it did not appear to me, being a tax on surplus profits over four per cent., to properly belong to the cost of gas, but should be an amount handled in the Profit and Loss Account.

Q. And should be taken out of dividends going to stock-3690 holders, is that right?

A. It looked that way to me, yes. It was——

Q. Is your conclusion reached because it is a tax on dividends in excess of four per cent.?

A. Because it appears to be a tax.

Q. In excess of four per cent.?

A. In excess of four per cent., as stated to me.

Q. Take the next item which you exclude from operating cost, interest on unpaid taxes, $94,506.29. You recognize the propriety of a corporation, acting under legal advice, to contest in the interest of its stockholders and consumers taxes which are assessed beyond a valuation that seems to the company fair, do you not?

A. Yes.

Q. And if the company succeeds in such litigation as that and reduces the amount of taxes or keeps taxes low for succeeding years, that reduces the amount of taxes that go into the operating cost of gas, does it not?

A. Yes.

Q. On the other hand, if the company, acting prudently in contesting the taxes, is unsuccessful, and has to pay attorneys' fees and a penalty in the shape of interest on the tax, should not that likewise be charged in the operating cost of gas?

A. Using your own language, for succeeding years, if distributed.

Q. But the interest for the year 1905 is for the year under consideration. Should not that interest, assuming that the tax was prudently contested and under legal advice, be allowed to the company as an operating cost?

A. That is an expense incurred as an adventure under the guidance of counsel, and——

Q. But if the adventure comes out favorably, then it will inure to the consumer, because the taxes chargeable to the operating cost of gas would be lower?

A. Yes, for many years, probably.

3691 Q. Then, if it does not happen to come out successfully, but was undertaken prudently, should not the attorneys' fees which were incurred in contesting that tax be allowed as an operating cost of gas?

A. Not against one year. Divided up.

Q. Your theory is that this $94,000 should be divided over several years?

Mr. Burr: I think the Doctor misconceives the question. The taxes are imposed every year.

Mr. Mathewson: I hardly think he does. That is another proposition.

Q. (Question repeated.)

A. If I were dealing with the matter myself I would distribute it over a period during which the gain or less in taxes might properly be expected. Of course, it is a matter that admits of a good deal of discussion.

Q. But you have excluded it entirely in this year, 1905, and have allowed no part of it in the operating cost for the year 1905. You would, then, revise your figures in that regard in some respect, would you not, upon reflection?

A. Instead of charging this amount of $94,506.29 to the cost of making gas, I would have in exactly similar cases of somewhat larger amounts, carried it to suspense account, awaiting the outcome, and in this present case, not being able to carry it to suspense account, awaiting the outcome of the legal suit, I have temporarily and as an extraordinary expense, thrown it out of the cost of gas.

Q. But if you carry it to suspense account, that means that you must have an allowance in the way of a reserve or contingent fund per thousand feet to take care of your *of* suspense account, so it comes into the operating cost of gas just the same, does it not?

A. The suspense account does not come into the account
3692 of the cost of gas or electricity, or any other manufactured
article that is brought out by the corporation or individual
manufacturing it.

Q. Does it not, sooner or later?

A. It awaits the proper partition to the various accounts to which it is determined to be charged when the suspense is ended.

Q. However you choose to treat it ultimately, either upon one year or several years, and either through a suspense account or by charging it into the proper accounts, at some time it does get into the operating cost of gas, does it not?

A. Usually into the profit and loss account, and not the cost of gas or other material.

Q. But it gets into the expenditures in making and distributing the cost of gas and the expenditures that you have to make before you deduct, to determine what you have left to pay interest and dividends, does it not?

A. It has to come out of the income before you get through with it.

Q. Exactly. Now we have disposed of these items which you have excluded in your original testimony from the expenditures shown in Exhibit 94. In addition to these figures, you make certain credits further reducing the operating cost of gas. One of them is stove rent, is it not, which is part of the miscellaneous income, $123,322.60?

A. Is that page 2303, near the top?

Q. Yes.

A. Will you allow me an explanation, or——

Q. I think it is quite clear, for you include the repairs as to gas stoves.

A. For the sake of clearness, I would like to explain that the first method of deducing the apparent cost of gas ends on page 2302, and the second method of deducing the cost of gas begins at 2302, at the paragraph referring——

Q. I think it is clear enough. You deduct the amount of stove
rent, do you not?

3693 A. I deduct the amount of stove expense from the amount
of stove rental reported in Exhibit 224 and I have a balance
left of $66,368.25.

Q. I understand. Well, that is exactly the same thing as though you included repairs to gas stoves in the operating cost of gas as is done in England, and then deducted the stove rentals from the operating cost thereunder. It amounts to the same thing precisely, does it not?

A. No, it is a seperate enterprise entirely.

Q. No, no. I am not referring to that feature at all. It amounts to the same thing so far as dollars and cents go, whether you include repairs to gas stoves in the operating cost of gas and then deduct thereafter your $122,000 of stove rentals, or whether you exclude repairs to gas stoves from the operating cost of gas in the first instance, and then only deduct the difference between the repairs and stove rentals, which is your $66,368.25; it amounts to precisely the same thing, does it not?

A. It amounts to adding——

Q. Does it not amount to the same thing so far as the outcome is concerned?

A. No, I can explain it in a very few words to you.

Mr. **Burr**: The answer is no.

Q. Well, your answer is no?

A. Yes.

Q. Very good, I am willing to accept that as your answer.

A. The difficulty is that you cannot transact ordinary business on the basis of answering yes or no. You can do some things that way, but not the transaction of ordinary business.

Q. Well, if you will explain how it makes any difference in dollars and cents at the end, I will be glad to have you do it, because I cannot see it.

A. It makes a difference in the cost of gas.

3694 Q. Does it make any difference in the balance left as distribution for dividends or interest, whichever way you treat it?

A. Practically none at all.

Q. Does it make a cent's worth of difference?

A. I say practically none at all.

Q. Won't you eliminate the word practically and tell me whether it makes any difference in dollars and cents when you come to a discussion of the profits you have left for distribution?

A. Do you mean the balance will be the same?

Q. I do.

A. The balance will be the same, but the two quantities from which the balance is derived will be different.

Q. Now, it appears that from the operating cost of gas, while you deduct the repairs to gas stoves which are .42 cents you do not deduct the repairs to meters which amount to more than three times as much, or 1.3 cents, as shown in Exhibit 94. If you take one from the operating cost of gas why should you not take the other from the operating cost of gas?

A. Referring to what page?

Q. 2339, item 50 of your segregation.

A. On page 2339, item 50, repairs to meters, $172,925.52; per thousand, 1.31 cents.

Q. Well, I have already stated that.

A. In this segregation I have not used any opinion of my own. I have simply followed the established English method as closely as I could.

Q. But have you, Professor, because we have shown that the established English method is to include stove repairs as part of the distributing expense, which is a part of the operating cost of gas and you have done directly contrary in your computation as to stove repairs.

A. I have included the rent and repairs both by deducting one from the other.

Q. But the English method includes stove repairs, does it not, as part of the operating cost of gas which you seem to lay great stress on.

3695 A. As I understand the English method—and I may find that I can be corrected—what they call stove repairs is the difference between the income and the outgo, the rental.

Q. If, then, they include something for stove repairs and it is such a difference, it must be that the receipts for stove rentals are less than the expenditures for stove repairs, must it not, else there would not be any balance to include as an expense?

A. I understand it is a settled policy to come as near as possible even, on the stove business with the English companies, submitting if necessary to a slight loss in order to increase the output of gas. On that point I am not as well informed as I might be, not having lived in England.

Q. But you have told us what the English practice was and that you were following it and I want you to follow it consistently if at all.

A. I would be delighted to do so.

Q. And not mix us up. Won't you look at page 4 of Field's Analysis and see whether you do not find, as we found before, stove repairs under distribution charges?

A. Yes.

Q. Now, don't you find on a previous page, page 3, as a separate item, stove rentals under income?

Mr. **Burr**: It does not say under income, but stove rental is there.

Mr. **Mathewson**: Those pages cover income in Field's Analysis, you will see. That is the way it is arranged.

Q. That is a simple question. Let us have an answer to it.

A. I find stove rentals mentioned there, but I am looking further for a matter which I looked up some time ago showing their treatment of these amounts at the end.

Q. (Question repeated).

3696 A. My answer is, I do, and I am looking further for the method of summation used in the case of net gas rentals, meter rentals, stove rentals, rents receivable and miscellaneous receipts.

Q. Well, now on page 3, in connection with the statement of accounts by the British companies, we find in the first column, net gas rental, which means the average price received for gas, does it not?

A. Gas rental means price.

Q. Then, in addition to that, we have meter rentals as another column?

A. Yes.

Q. And as a third column we have stove rentals, haven't we?

A. Yes.

Q. Then in a fourth column we have rents receivable and miscellaneous receipts?

A. Yes.

Q. So it is a fact, is it not, that, according to Field's Analysis, which you have quoted, the accounts are treated precisely as the Consolidated Gas Company treats them, that is to say, that the stove repairs are included in the operating cost to gas, and, on the other hand, stove rentals appear separately as an item of income and not in the operating cost of gas at all?

A. So, also, do meters, yes.

Q. So also do meter rentals, but the answer is yes to that, is it not?

A. Yes.

Q. Now, you also deducted rent that the company paid amounting to $42,674.71, or .32 of a cent, being Item 62 of Exhibit 94, from the operating cost of gas, and, on the other hand, you credited against that rents received by the company amounting to $37,408.88, which, you said, left a balance of $5,265.83. Now, you observe, don't you, that rents receivable, according to the English method, and as appears in the fourth column on page 3 of Field's Analysis, are included in income, rents receivable and miscellaneous items?

A. Rents receivable and miscellaneous items are included as a separate item in the records of the company, not in the price of gas.

3697 Q. And that is the way that rents receivable are treated by the Consolidated Gas Company in the statements submitted here, is it not?

A. That I don't know until we have finished our examination.

Q. In the accounts presented here they are included, are they not, as part of the miscellaneous income?

A. Apparently.

Q. And rents payable are included, are they not, in page 5 of Field's Analysis on the same basis as taxes and management charges and bad debts as part of the cost of gas business?

A. They are also included apparently as one of the accounts of the gas business.

Q. And you do not find, do you, in Field's Analysis, anything or any place where rents receivable and rents payable are offset against each other or where repairs to gas stoves and rents from gas stoves are offset against each other and only the balance used in order to reduce the apparent cost of gas?

A. That is what I was looking for.

Q. Well, if you can find it there I would like to have you point it out.

A. The figures given in Field's Analysis are——

Q. I do not want you to get discoursive, but I want you to point out in Field's Analysis where you can show that the balance is deducted and only the balance used in computing the apparent operating cost of gas. I do not want your analysis but want you to show it in Field's.

A. I call your attention to the fact that Field does not carry his analysis to final conclusions as is necessary, and therefore this deduction of one account from another is not required.

Mr. **Burr**: That is, it does not appear.

Q. It does not appear in Field's Analysis?

A. No, it does not appear.

3698 Q. You have stated that you think the amount of renewals appearing in the Consolidated Gas Company accounts from 1884 down to date were excessive. How about the repairs, do you find those excessive, too?

A. Pardon me, I stated that of two statements as to renewals made, one for the calendar year and another for twelve months ending October 31st, I gave my preference to the smaller amount of $194,666.87.

Q. Naturally, but you said, too, did you not, that you had examined State's Exhibit L relating to renewals and repairs from 1884 down to date, and that you thought the renewals were excessive?

A. That they appeared to be.

Q. How about the repairs which appear also in that exhibit, do they also appear to you to be excessive?

A. I should have to look it over very carefully. It is a large matter.

Q. It appears for the entire twenty years they only averaged 10.89 for repairs and renewals, whereas your associate, Professor Bemis, has testified that he considered in Chicago 10.16 to be a fair figure, and that the repairs and renewals would be greater in New York than they would be in Chicago.

A. Will you allow me to defer my reply until I know something about your accounts?

Q. No, I cannot because I am asked to cross-examine you now and your counsel has produced you for that purpose to-day.

A. It is impossible for me to indulge in that kind of thing, theorizing as to fractions of a hundredth of a cent.

Q. It was not my suggestion that these renewals and repairs were excessive from 1884 to date; it was your volunteered statement this morning, and I propose to cross-examine you on that. I have called your attention to Professor Bemis' statement and allowance in Chicago of 10.16 with the statement of his that repairs and renewals would be greater in New York than Chicago. 3699 If that is a fair statement of Mr. Bemis's testimony are you prepared now to say that 10.89 is an excessive figure for repairs and renewals in New York?

Mr. **Burr**: You will remember that Professor Bemis said that was a statement made by him in Chicago as read here from the report and that he did not at that time have the benefit of the testimony in this case.

A. I cannot answer that question without further information as to the accounts of the company.

Q. I show you again Field's Analysis, page 6, and ask you if the figures under the heading "Net coal and working expenses" do not include stove repairs and rents payable without any deductions for stove rentals and rents receivable? I have figured it out for you, if it will aid you any in answering the question, and you can see what the items are (handing book).

A. This is figured on the mains of the three metropolitan companies, is it not?

Q. Well, whatever it may be figured on, I am simply referring to the form of the account which you approved in your direct testimony.

A. The distribution charges 3.71 cents appear to include salaries, wages, wear and tear, meter repairs and stove repairs and also appear to check out when added up for net coal and working expenses——

Q. (Question repeated.) Won't you answer the question that I have just asked you?

A. I think I have answered it.

The Master: Is it yes or no, Professor, that is the point?

The Witness: Yes.

3700 Q. And the item "Net coal and working expenses" is used as an equivalent in England for our expression "Operating cost," is it not?

A. I should have to look that up again.

Q. Is it not your impression?

A. In a general way.

Q. Now, will you look at page 2303 of your testimony where you figured out after these various deductions 53.51 cents per thousand feet as the operating cost of gas. Taking this figure without correction, you have not included therein any amount, have you, in order to equalize the renewals and repairs for the calendar year 1905 with the average renewals and repairs as shown by the company's experience.

A. I have stated it to be the cash cost of gas for 1905 and nothing more or less.

Q. Then will you answer the question that I asked a moment ago?

A. I have not.

Q. Professor Bemis included 5.31 cents to equalize by reason of the fact that the repairs and renewals were much lower than normal. If you add that to 53.51 cents, it will make over 59 cents, will it not?

A. Acting as your computer, yes.

Q. Nor does this 51.53 cents include anything for reserve or contingent funds, for which Professor Bemis before the Gas Commission allowed the company three cents, does it?

A. Referring to page 2339, item 67, contingent expense $194,666.87, or 1.45 cents, was included——

Q. I do not think that is an answer. Can't you answer with yes or no as to whether it does or not?

Mr. Burr: Pardon the suggestion, but I think you will get along quicker if you leave out the references to Professor Bemis, because I do not think the Professor knows what Professor Bemis testified.

Mr. Mathewson: Yes, because he says he has read all the testimony before the Gas Commission. 3701

Q. Does the 53.51 on page 2303 of your testimony include any allowance or reserve or contingent fund?

A. Yes.

Q. How much?

A. $194,666.87 or 1.45 cents.

Q. On the contrary, that is not a reserve or contingent fund, is it, but an actual expenditure for renewals, as you understand it?

A. It is called contingent fund by the Consolidated Gas Company.

Q. But did you not take that ten cents contingent and renewal fund and deduct it from the operating cost of gas as shown by the company and include in its place $194,666.89 which you said represented the actual expenditures for renewals for the nominal year?

A. I beg pardon, that appeared to represent.

Q. Well, that appeared to represent. Then don't you understand that that $194,666.87 which you included as part of your 53.51 cents was not a reserve or contingent fund, but was an actual expenditure?

A. Did no contingencies occur during the year?

Q. And they were provided for in the balance of the ten cents which you have excluded. Now won't you answer the question?

A. Will you read that again?

(Question read.)

The Witness: I understood it to mean an expenditure of the kind classed as contingencies.

Q. Well, if you expend $194,000 in a year, it is not a contingent item at the end of that year, when it has been spent?

Mr. Burr: It has been spent meeting the contingencies that have happened during the year.

3702 Q. Let us not split hairs about this. Don't you understand that that $194,000 was actual renewals made during that year so far as you have any understanding on the subject?

A. Trying to be clear——

Q. Can't you answer that yes or no?

A. No.

Q. You can make it clearer by answering it yes or no than in any other way I know of.

A. Trying to make it clear, I understood by contingent expense, what I have heard some of your officials call undistributed expense, meaning by that, expense which it is hardly possible to anticipate or classify.

By the Master:

Q. That is not the point. The point is whether you did not in making up this figure consider that $194,000 as representing money actually paid out for actual renewals. Did you or did you not?

A. Mr. Master, I am terribly embarrassed by the fact that all this testimony that I am giving is to me individually doubtful because the figures submitted to me are doubtful.

Q. That may all be, but you present on page 2302 a certain result and the question is whether in arriving at that result you take

$194,000 as representing renewals or not. Now it may have been false or may have been true and you are not responsible for that. The question is how did you take it in making your figures?

A. I took it as the only thing possible for me to know, a contingency stated by the company as a contingent fund.

Q. Then do you mean to say that it represented something that was not paid out at all?

A. I don't know.

By Mr. MATHEWSON:

Q. Let me read from page 2312 of your testimony in this case.

"A. Referring to Mr. Addicks' item 'Actual replacements' 3703 2.12, it would appear as if the actual replacement for the twelve months ending October 31st, 1905, amounting to $194,666.87 or 1.45 cents per thousand cubic feet sold for the calendar year did not corroborate" and so forth.

Now didn't you consider then the $194,666.87 as representing actual replacements for that year?

A. All I truly know about that is that the word contingent was wrong and a statement was made that it was replacements. I have had no opportunity to examine it.

Q. Why did you deduct any part of the ten cents then if the whole ten cents in your mind was in exactly the same category, that is, contingent?

A. Because the ten cents was obviously preposterous.

Q. Why did you take the $194,666.87?

A. Because it was furnished by the company, as the best that I could do.

Q. As representing what?

A. I have no idea, but figures written by them under the name contingent. Whether it existed or not I don't know.

Mr. BURR: And as it appears on Exhibit 94?

Mr. MATHEWSON: Show me the $194,000 marked as contingent on any paper before this tribunal.

The WITNESS: Let me see the index.

Q. Perhaps I can solve this by asking you this question. Don't you remember that Mr. Carter testified in reference to this 10 cents charge both before the Gas Commission and here, stating what proportion of the 10 cents per thousand feet under the heading "Contingent and renewals" represented actual renewals and what part of it represented a contingent or reserve fund? Don't you remember that, that he did?

A. I have a very distinct recollection that that 10 cents was qualified.

3704 Q. Don't you remember that he testified stating what proportion of the 10 cents represented actual renewals and what proportion represented a contingent or reserve account as distinguished from actual renewals? Now, don't you remember that?

A. I would prefer finding the exact words of his testimony.

Q. Don't you remember that, Professor?

A. I can find the exact words of his testimony, and I prefer to find that.

Q. Well, in your testimony at page 2302 you say "Referring to the testimony before the Gas & Electricity Commission of New York it appears that this account was sophisticated by the introduction of a theory and the actual renewals hidden within the 10 cents per thousand arbitrarily fixed as the cost of contingencies and renewals. On page 1183, printed testimony before the Gas & Electricity Commission it is $194,666.87."

Q. Now, what is the $194,666.87, and what did you refer to and have in mind that it was? In other words, did you have in mind that it was actual replacement or contingent fund which did not represent actual replacement?

A. The statement of Mr. Carter, secretary, that the total of replacements in distribution plants and at works for the months of November and December, 1904, amounted to $87,522.47. The replacement in works and distribution plants actually occurring during the ten months ending October 31st, 1905, amounted to $107,144.40, making a total of actual replacements during the nominal year ending October 31st, 1905, of $194,666.87.

Q. Well then, you understand that $194,666.87 represents actual replacements, don't you?

A. To my——

Q. Well, do you not understand that, Professor? Can you not answer that yes or no?

3705 Mr. Burr: You understand that is the claim made by Mr. Carter, that it does represent actual replacements?

A. I don't understand his meaning of the word "replacements."

Q. Call it renewals. He has testified to that several times, that replacements and renewals mean the same thing.

A. Renewals has no proper meaning in the use of this word. You can do but two things to a gas works——

Q. Let me ask you another question. Do you understand that the $194,000 represents something actually done?

A. Claimed by Mr. Carter, say.

Q. And in your computation you assumed that to be a fact, didn't you?

A. I accepted it.

Q. So, returning again to page 2303 of the present record, to your 53.51 cents, that does not include anything does it, for reserve or contingent fund to cover matters which are not actually accomplished?

A. It does not cover matters which are not actually accomplished.

Recess until 2:15 P. M.

After Recess.

William D. Marks resumed cross-examination (continued):

By Mr. Mathewson:

Q. In order to obtain what you compute as the cost of the Consolidated Company's property in the gas business to-day, I find you take at page 2336 the increase in property amounting to $9,693,565.90 since 1884, then deduct from that $597,918.28 which
3706 you say represents the increase in real estate, leaving a balance of $9,095,647.62. The increase that you deduct appears to be what you term the increase from November 11, 1884, to December 31, 1905, instead of October 31st, 1905, doesn't it?

A. What date was that?

Q. The difference between October 31st, 1905, and December 31st, 1905, happens to be negligible, $128.71, but as a matter of fact, you took the increase to real estate to December 31, 1905, didn't you?

A. Exhibit 89 is the one I see that I used. Exhibit 89, October 31, 1905, and November 11, 1884.

Q. Yes, that gives the total increase as $9,693,565.90, but when you come to deduct what you call the increase in real estate you deduct the increase up to December 31st, 1905, do you not?

A. You mean from that?

Q. Yes.

A. Yes. Of course you understand——

Q. There happens to be very little difference in this case, but that would not be a proper method of procedure, would it?

A. All this is understood as rudely approximate and I was using what was readily available.

Q. The increase in real estate was available up to October 31, 1905, wasn't it, by this same exhibit?

A. Yes.

Q. Now, from this $9,095,647.62 which you call the increase after deducting the increase in real estate, you make further deduction representing the increase in value of mains, services, meters and other personal property, $12,866,766.62 being the value of the mains, services, and so forth, on October 31st, 1905, and deduct from that the appraised value in June, 1884, of $7,487,000, less office furniture, $70,000, which you omit, do you not?

A. In Senate Document 47, 1886, page 652.

3707 Q. But you get after this deduction of $70,000, the figure $7,417,000 as increase in mains, services, meters and other personal property, is that right?

A. No. The difference in the $5,000,000—that is the total of the book account, $7,417,000; in 1884.

Q. Yes, and you deduct that from $12,866,766.62?

A. Yes.

Q. Which is the book value of those items, and get a remainder of $5,449,766.62?

A. Five and one-half million.

Q. Well, I have given you the exact figures, I think?

A. Yes.

Q. And deduct that last amount from $9,095,647.62 which was the difference between the increase in our property according to your figures and the increase in real estate and get a remainder of $3,645,881 as the increase in value of plant since 1884?

A. Yes.

Q. Now, will you not look at Exhibit 79 in evidence here and see if that is not something like $260,000 out of the way as to increase in plants?

A. See if what amount is $260,000?

Q. The amount of increase of plant which you have figured out, to wit, $3,645,881. Isn't that about or, to be exact, $259,056.31 less than the actual increase in plant as shown on Exhibit 79?

A. What is the actual increase shown on Exhibit 79? What is the amount?

Q. $3,904,937.31, is it not?

A. $3,904,937.31, that is the amount as per your books, as I understand it, yes.

Q. Then how from our books do you figure out now an increase of only $3,645,881 in plant or $259,056.31 less than the amount from which you were computing actually showed?

A. The first thing that I did was to take the total amount claimed by you.

Q. We have already gone over that, Doctor, and shown just
3708 how you got it. Now, where does this discrepancy arise in
your computation?

A. It arises undoubtedly from the fact that instead of taking the figures on your books I have taken first of all the figures given in evidence principally by Mr. Simpson amounting to $12,866,766 (page 2366), and from that I have subtracted the statement made by J. Yalden, Senate document 47, of 1886 (page 652 of the document, page 2367 of the testimony), and by doing so have obtained about five and one-half million dollars, which five and one-half million dollars I have subtracted from that $9 000,000, leaving about three and one-half million dollars as against what you have with your books, of which I have no knowledge, $3,904,000.

Q. But you do not find in Mr. Simpson's testimony anywhere that the value of the meters and other items were $12,866,766.62, do you?

A. I do not, no; but if I remember all right, he testified, with my entire accord in the matter, that the mains were worth about $7,852,000, the services worth about $1,212,000, and the meters $3,802,000, if I remember rightly, was a book account, he has stated, I think, in Exhibit 81. I may be wrong about that.

Q. But you took the increase, did you not, from November 11, 1884, and did you make any allowance for increase in real estate between the time of the appraisal in June, 1884, and the time the Company took over the property on November 11, 1884?

A. I did not, for I was simply endeavoring in an approximate way to relate the actual facts as they appeared, from very insufficient data of structural cost.

Q. Well, but to get at the structural cost, you first endeavored to get at the increase in plant and other items from 1884 down to October 31, 1905, and what we are dealing with now is the increase?

A. Yes.

3709 Q. And I have shown your figure increased $3,645,881, whereas the very accounts from which you are computing showed the increase in plants to have been $3,904,937.31. Now did you take into account at all the increase in the real estate obtained by the Company in November, 1884, above that price or the value of the appraisal in June, 1884, amounting to $258,927.60?

A. I simply took the statement given in Exhibit 89 of the total increase (page 2366).

Q. But Exhibit 89, you will observe, deals only with the increase in these items between November 11, 1884, and October 31st, 1905?

A. Yes.

Q. It does not at all deal with the increase between the date of the appraisal or examination in June, 1884, and November 11, 1884, when a considerable change arose, does it?

A. No attempt was made. It was impossible——

Q. Well, it doesn't, does it?

A. It did not.

Q. So that your increase in value of plant would be short by the amount of the increase between June, and November, 1884, wouldn't it?

A. In so approximate a study as this it would be of no consequence.

Q. Well, $259,056.31 would be of considerable consequence to some of us, Professor, but the fact is, whether it was of consequence or not, it was not included, was it?

A. No.

Q. On page 2365 you make a statement purporting to give the amount at which the plants of the six old companies were carried on the books of those companies, as shown by Yalden's summary. Where do you find the valuation of the plant of the New York Gas Light Company, $2,893,767.35, which should appear, if I read your testimony correctly, on page 712 of Senate Document 47, of 1886?

A. Is that the second line or third line from the top?

The Master: No, the fifth line of figures from the bottom, on page 2365.

3710 A. "New York Gas Light Company, works and apparatus, $2,893,767.35" are the figures to which you refer, are they not? That was obtained in this way: On page 712 of Senate Document 47 of 1886, under the head of investments, works, apparatus, meters, mains and so forth were all together given at $4,186,000. From this $4,186,000 was subtracted by the use of the inventory made by Mr. Rowland the value of the mains, services and meters, leaving as the result the approximate and only the approximate value of the works and apparatus.

Q. Did you take the total as found by Yalden and then deduct the valuations of these particular items as found by Rowland in order to get your estimate of $2,893,767.35?

A. The only possible method of even approximating it.

Q. Did you do that?

A. Yes, I did.

Q. But you say Rowland's figures on the appraisal were very much above the figures at which these plants were carried on the books of the constituent companies. Do you think that reaches a fair result if you take the total of all the items including plant as found by Yalden as charged on the books of the constituent companies and then deduct the appraisal of Rowland as to a part of those; as to all except the plant? Do you think that would give us a fair result in the remainder as the value of plant?

A. The ap-raisal of the mains, services and meters is made and added in elsewhere.

Q. I am merely getting at this valuation of $2,893,767.35 and ask you whether you think that a fair figure can be obtained by taking the book charges for this property in toto and deducting that from the appraisal of a portion of it made at a much higher rate?

A. If I deducted too much at one point I have added too much at another.

3711 By the **Master**:

Q. Do you think it is fair?

A. I do, for all practical purposes.

By Mr. **Mathewson**:

Q. Now, I find that you take the total value of plants as you find them charged on the constituent companies, $10,737,418.70, that you increase $3,645,881 and get $14,385,299.70. What would that amount to if you added the $258,927.60 increase which you omitted between June and November, 1884?

A. At what page of the evidence?

Q. Page 2367, $14,385,299.70. You figured that out as against $16,175,382.67 which is the figure at which the plants are now carried on the books of the Consolidated Company?

A. You wish me to add $258,927.60——

Q. Yes, and including that increase what would the total be. I make it $14,644,227.30?

A. Acting as your computer, I make it $14,644,227.30.

Q. And so far as the plant is concerned, if your method of taking the entire assets of the New York Gaslight Company, as found by Yalden, and deducting therefrom the appraisal of Rowland as to all assets but plant is found to be incorrect, you would still have to add something more to that $14,644,227.30, would you not, to get the real valuation on your theory?

A. If it was incorrect, I might have to add or subtract, I don't know which.

Q. Well, in view of the fact that you have stated, that Mr. Rowland's appraisal was higher than the figure at which these plants were carried on the books of the constituent companies, it would mean you have deducted too much and that your remainder representing the plant of the New York Company would be too little, would it not, if that was not a correct method of procedure?

3712 A. No, but you will observe I took the appraisal of 1884, made by the company for mains, services and meters, and then I took the appraisal made by the same company for 1905, or thereabouts, and I subtracted one from the other and consequently had the same authority whether correct or not, in both cases, presumably.

Q. I am not getting at the comparison at present. I am simply getting at the valuation on the books of the constituent companies plus the increase from 1884, down to date?

A. Yes.

Q. Your valuation of the plant of the New York Gaslight Company as distinguished from its other assets would be too little, would it not, provided the appraisal of Mr. Rowland for the items which you deducted were a greater amount than those items were carried on the books of the constituent companies, is not that clear?

A. No, because I used for mains, services and meters Rowland's appraisal to add in one case, whereas in the present case I have used it only to subtract.

Q. I am dealing only with the present case and with nothing else except the valuation of plant. Now, won't you please answer the question, having that in mind?

A. Mr. Rowland's appraisal——

Q. Cannot you answer that question on the supposition that I have made?

A. What is the question?

Mr. Mathewson: The Stenographer will read it.

The Stenographer (reading): Your valuation of the plant of the New York Gaslight Company as distinguished from its other assets would be too little, would it not, provided the appraisal of Mr. Rowland for the items which you deducted were a greater amount
3713 than those items were carried on the books of the constituent companies; is not that clear?

Mr. Mathewson: Now can not you answer that?

A. I would like to. Nothing would please me better than to say yes and no to you. Mr. Rowland's appraisal does not appear at any point on the books of the constituent companies——

Q. No, of course not.

A. It does appear I presume on the books of the Consolidated Gas Company. Therefore in dealing with the books of the Consolidated Gas Company it is not improper to use his appraisal as something to be added or subtracted *pro rata*.

By Mr. Burr:

Q. You mean as the books of the Consolidated appeared of November 11th, 1884, we will say?

A. Yes. There were no books of the Consolidated before November 11th. It did not exist.

By Mr. Mathewson:

Q. You did not proceed upon any *pro rata* basis in getting the valuation of the plant of the New York Gas Light Company at $2,893,767.35, did you?

A. This is all the crudest sort of exploration while waiting an investigation of some real value, merely for the purpose of showing the absurdity of the present values stated.

Mr. MATHEWSON: I move to strike the answer out.

Motion granted.

Mr. MATHEWSON: Repeat the question.

The STENOGRAPHER (reading): You did not proceed upon any *pro rata* basis in getting the value of the plant of the New York Gas Light Company at $2,893,767.35, did you? 3714

A. At what point of the testimony?

The MASTER: You just said a moment ago you thought it was proper to take Mr. Rowland's valuation on a *pro rata* basis in getting at those values. Mr. Mathewson now asks whether you did it in getting at this figure in the fifth line of figures from the bottom on page 2365?

The WITNESS: I did. If such a crude performance can be called pro rating anything.

Q. The plant of the New York Company and all its assets in the gas business were carried on its books as found by Mr. Yalden at a certain figure, were they not?

A. They were.

Q. Now referring to Rowland's appraisal, did you take the entire amount of the appraisal of the assets of the New York Gas Light Company as appraised by Rowland and ascertain what proportion of that entire valuation of Rowland's was represented by plant?

A. Why certainly I did not. I would say—

Q. Then how did you apply any *pro rata* basis to getting this $2,893,767.35 as the valuation of the plant of the New York Gas Light Company on the books of that company?

Mr. BURR: Now you may explain the method fully that you adopted.

A. It was a case of compensation in the fact that whatever the value was of the mains, meters and services to be subtracted from the total value given, if I remember rightly something like $4,186,000.

Q. Yes, and from that you deducted, you have said, the appraisal of all the other assets except plant at the figures appraised by Mr. Rowland? 3715

A. That's right.

Q. And you have stated that Rowland's appraisal was higher for the assets of these other companies than such assets were carried on the books of the companies, have you not?

A. Yes, I am not talking now—it is not true with regard to the Consolidated.

Q. Oh, no, I am talking about the six original companies and the transfer in 1884.

A. I am talking about the Consolidated prices. Rowland's prices or valuations were the basis of the books of the Consolidated Gas that were——

Q. Well, I want to know what you meant a moment ago by saying you took a *pro rata* basis in computing the valuation of the plant of the New York Gaslight Company according to the books of that constituent company.

A. I will do my best to make that clear. The books of the Consolidated Company are based on Rowland's inventory as to the figures for their plant. The books of the six merged companies are not based on the inventory——

Q. We all know that.

A. When dealing with the figures of Rowland's inventory, it is in a crude way proper to make use of the figures, either in the books of the Consolidated Gas Company, but not of the six merged companies, or of the figures of Rowland's inventory.

Q. But you repudiate Rowland's valuations on the one hand and then you used certain of Rowland's valuations in deducting from the total assets of the New York Gaslight Company, as shown on the books of that company, to get a remainder, which you concede is the value of the plant of the company, do you not?

A. I repudiate both Rowland's inventory and the books of the Consolidated Gas Company. However, there is a pro rate of error, I presume. I don't know.

3716 Q. Now, taking your total of $14,385,299.70 (page 2367) waiving these other points to which I have called your attention, it appears that you deduct from that total $1,508,035 on account of the portion of the 18th Street plant taken by the city and $569,495.57 on account of the 111th Street plant which formerly belonged to the Harlem Gaslight Company, or a total deduction of $2,077,530.57, leaving a balance of $12,307,769.13 which you compute as the present value of plant on the basis of Yalden's figures, plus additions since. This valuation of $1,508,035 for the 18th Street plant taken by the city, was not Mr. Yalden's valuation of the 18th Street plant according to the books of the original companies, was it?

A. Mr. Yalden made no valuations.

Q. You have spoken of them from time to time as his valuations. The $1,508,035 is not the figure at which the 18th Street plant was carried on the books of the Manhattan Gaslight Company, is it?

A. Certainly not. It is Mr. Mayer's.

Q. Yes, Mr. Mayer's. Now, at what figure was that carried on the books of the original Manhattan Gas Light Company? Was it not $1,281,694.84?

Mr. Burr: I do not see that figure here.

Q. Well, can you tell at what figure that plant is carried, that is the entire plant at 18th Street, on the books of the Manhattan Gas Light Company according to Mr. Yalden?

A. Page 2365——

Q. Now, of your testimony, I know what you state there, but I am asking another question.

A. There appears the total of $2,238,629.82.

Q. For what?

A. For Manhattan Gas Light Company manufacturing building and Manhattan Gas Light Company apparatus.

Q. Well, but they owned both the 14th Street plant and
3717 the 18th Street plant. I am now asking at what figure this
18th Street plant entire was carried on the books of the Manhattan Gas Light Company as reported by Mr. Yalden?

A. I do not think I stated that in my testimony.

Q. Well, I ask if you can state now?

A. I can look it up.

Mr. Burr: You refer to page 674, on page 2365, and you say. referring to page 674 the value of the same real estate belonging to the various companies consolidated appears to be given as follows: $930,872.45——

Mr. Mathewson: That is real estate. We are talking about plants now.

The Witness: There are two entries there making a total of $2,338,629.82, but the examination was not minute enough to require going into those details.

Q. Now Professor, without taking your time to compute it, according to the computation which I have before me the entire amount at which the 18th Street plant was carried on the books of the Manhattan Gas Light Company according to Mr. Yalden, land being excluded, was $1,281,694.84. If that be so, you have made a deduction upon Mr. Mayer's estimate of considerably more than the entire plant was carried by the Manhattan Gas Light Company, have you not?

A. The figures seem to exceed it.

Q. Have you any information as to how much of this new construction was applied to the Manhattan plant at 18th Street since 1884?

A. I have not.

Q. Now, let us take this Harlem Gas Light plant at 111th Street. You have stated in substance, if I understand you correctly, that you
made this deduction of $569,495.57 on the theory that the
3718 111th Street plant was abandoned, did you not?

A. Abandoned, out of use.

Q. Is this $569,495.57 Mr. Yalden's appraisal of the entire plant?

A. Of course I would have to look that up again to be positively certain and verify it, but it appears to be $569,495.57 as the value in 1884.

Q. In 1884 But what about the additions to plant since 1884 at 111th Street, have you taken those into consideration?

A. I mentioned the fact that the holder "Of which the holder now remains," on page 2367.

Q. Have you made a personal inspection of that 111th Street plant?

A. I have not. This is information derived from statements of gentlemen who claim to know.

Mr. Burr: Not in the testimony in this case?
The Witness: Yes.

Q. Not from any testimony presented in this case?
A. No, but from gentlemen who claimed to know.
Q. Now, don't you know that as a matter of fact the City acquired only one block out of four of the 111th Street station?

Mr. Burr: He is speaking in the testimony of 112th Street, is that the same thing?
Mr. Mathewson: Yes.
The Witness: Referring to Exhibit 48——

Q. Did not you gather that from the testimony?
A. I say, referring to Exhibit 48—there is an irregular plot there, part of which appears to have been condemned by the City and the rest to have remained in the hands of the company, and as I am advised from the testimony and from others, not in active operation, except as a distributing station.
3719 Q. However that be, is it not your information that only one plot out of four has been taken by the City and that the other three plots are still in use by the Company?
A. No. Part of it is used as a distributing station only.
Q. And have you not read the testimony, that the balance so far as not a distributing station, is held as a reserve capacity, and that the manufacturing apparatus there is in excellent condition and some of it has never been used?
A. I also was advised that the manufacturing apparatus was not complete.
Q. And you have deducted the entire valuation of the 111th Street plant as though it had all been abandoned, have you not, in this computation? The entire valuation as appeared by Yalden's figures, in spite of the fact that we still have three out of four blocks and that it is used as a distributing station?
A. In deducting the $569,500, Yalden's figures of 1884, I took a very small figure, presumably much less than the existing value of to-day, and therefore acknowledging all the time that this is but a crude exploration on my part, very much favored the company.
Q. You think it very much favors the company to deduct the entire valuation of the 111th Street plant, although only one block out of four has been taken by the City, do you?
A. Dating back to 1884, yes.
Q. And you observe that this plant is one which is valued by Mr. Mayer at $1,039,910, and you make no allowance for that at all, do you?
A. You are referring now to what plant?
Q. 111th Street.
A. I simply deducted the amount you have just stated, $569,500.

Q. Which was the entire figure at which it was carried on the books of the Harlem Gaslight Company in 1884?

A. Yes.

3720 Q. In other words, you have left in as part of the valuation of your plant only the items added since 1884, that is the effect of that, is it not?

A. I took it as a plant not used in the manufacture of gas, simply for distribution, and left, according to Mr. Mayer's statement, a million dollars to the credit of the company for a distributing station.

Q. Oh, no; but you have deducted $569,495.57, have you not, as against whatever valuation may be put upon it now?

A. As against a total valuation of $14,385,299.70——

Q. No, I am taking the 111th Street plant, not the value of all the plants. I say you have deducted on account of the 111th Street $569,495.67, have you not?

—. In so crude an exploration, it is impossible to individualize, and I did not treat that plant individually; I treated the lump sum of $14,000,000——

Q. Didn't you take $569,495.57 from your total estimate of plants on account of the abandonment of the 111th Street plant?

A. Yes, and from the $14,000,000——

Q. Was not that $569,495.57 the exact amount at which that plant was carried on the books of the Harlem Gas Light Company in the consolidation in 1884 according to Yalden's figures?

A. Yes.

Q. So that the result is this, you have left in your final estimate of plants, $14,000,000, only the amount of additions that have been put into the Harlem plant since 1884, is not that right?

A. All of which appeared on your books.

Q. Well, but is not that right?

A. Intentionally, allowing you what appeared on your books presumably——

Q. For additions since 1884?

A. Yes.

Q. And nothing more?

A. And presumably amounting to nearly a million dollars although I would require a more careful investigation before
3721 making any further figure. A most liberal treatment.

Q. You have left in your final valuation of plant only the additions to plant since 1884 at 111th Street, is not that the case?

A. I have left in the additions to all plants.

Q. I am talking—won't you answer my question as to this plant?

A. Including 111th Street.

Q. And that is all that is included as to 111th Street, isn't it.

A. I presume so. It applies equally to all the other stations.

Q. Now you take up the subject of real estate on page 2365, and start with the total for real estate $5,054,014.88, which you say is the summary of the real estate of the six constituent companies according to Yalden's figures. Now you have allowed in dealing with plant, mains, meters, services and so forth for increase since 1884. Why don't you add to the value of real estate which you have taken the increase in real estate since 1884 amounting to $597,918.28 as appears by Exhibit 89 and I think Exhibit 79 as well?

A. Because the plants, mains, meters and services have all increased in length, in number and in size, which, speaking crudely as I do of the accounts, does not appear to be the case with the real estate.

Q. But this $597,918.28 to which I have called your attention represents actual additions to real estate, if you have followed the exhibits and not a marking up of the value of real estate since 1884. Why then should not that be added to the figure $5,054,014.88 with which you started, being Yalden's figures in 1884?

A. I am not familiar with the details of the real estate account of the Consolidated Gas Company, and what I have said has been picked up from various sources and used merely as a rough indication of the probable change in values of real estate—or costs, I should say, not values.

3722 Q. But it is not necessary to take a rough estimate, if you look at Exhibit 79, and you say you have read this record very carefully. Does not that show an increase in real estate of $597,918.28 since November 1884?

A. Yes.

Q. Well, then, if that is a new item in real esate that ought to be added, ought it not to Yalden's figures of $5,054,014.88 with which you started?

Mr. Burr: I call your attention to the fact, Mr. Mathewson, that that is represented on that exhibit to be construction since the consolidation.

Mr. Mathewson: That is the general heading which is used to apply to all the items including buildings, machinery, mains and services, and it is stated in Mr. Carter's testimony that this represents additions, as you will recall.

Mr. Burr: Additional purchases of real estate?

Mr. Mathewson: Additions as I understand it to the real estate which we had in 1884.

The Witness: This is the first time I ever heard it stated that that $597,918.28 represented additional expenditures for increased real estate.

Q. I think it quite clearly appears in the evidence but in any event, if it does represent such new expenditures, it should be added to the $5,054,014.88 with which you started, should it not, in the same way as the increase in mains and services?

A. No one accustomed to business could answer that question without a thorough examination of the real estate account of the Consolidated Gas Company.

Q. Well, assuming that it represents additional real estate, it should be added, should it not, to the original figure of $5,054,014.88 with which you started?

A. Acting as your computer.

3723 Q. No, I don't ask you to compute, but merely ask you if it should not be added on that assumption?

A. As an assumption, yes.

Q. Now from Yalden's figures as quoted by you, and waiving the question as to this $597,918.28, additional real estate, you deduct $1,985,874.37 and get a balance of $3,068,140.51 as the present value of the real estate used by the Consolidated Gas Company——

A. Pardon me. Actual structural cost.

Q. Actual structural cost and not present value?

A. Yes.

Q. Now, this $1,985,874.37 which you deduct seems to be made up among other items of the following item: Little Italy Park, 111th and 112th Streets, Harlem, $365,000.

A. Page 2364.

Q. Yes. Now, you deduct that from the value of the land. Do you know what that land was carried at on the books of the Harlem Gaslight Company?

A. On page 2365 reference is made to page 760, Senate Document 47, giving an amount of $159,000 in round figures.

Q. Yes, $158,899.81 in exact figures.

A. Yes.

Q. Now, that real estate entered into the total of $5,054,014.88 with which you started at $158,899.81, didn't it?

A. Yes.

Q. And you have deducted on account of that real estate, $365,000, have you not, or more than twice as much?

A. That was the testimony.

Q. Oh, yes, but we are dealing now with Mr. Yalden's figures, and you are deducting that real estate from Mr. Yalden's figures at more than twice the amount at which it entered into the total of $5,054,014.88 with which you started, are you not?

A. Mr. Yalden's figures were used for the purpose of determining the amount of money claimed by the various companies to have been spent on their real estate, which appears to be about $5,000,000. 3724

Q. Now, can't you answer my question, Professor?

A. I am deducting the increase in price of the Harlem Gaslight Company's real estate at some subsequent period to November 10th, 1884, which appears to be $365,000.

Q. Now, will you be good enough to answer this question (question repeated)? You have stated that this Harlem real estate by Mr. Yalden's figures appeared to be $158,899.81 and at a figure which entered into the $5,054,014.88 with which you started?

A. Yes.

Q. Now, I say, you are deducting that same real estate at a valuation of $365,000 or more than twice as much as the figure at which it entered into *to* your original figures, is not that so?

A. I am deducting——

Q. Can't you give me an answer whether that is so or not?

A. I am taking it at the price of $365,000 given——

Q. And that is more than twice as much as the figure at which that same real estate entered into your initial amount of $5,054,014.88, is it not?

Mr. BURR: But always bearing in mind——

Mr. MATHEWSON: Please let me finish with the witness on this point.

A. Yes.

Mr. BURR: But always bearing in mind the figure $158,889.81 is the value as it appeared upon Yalden's account and $365,000 is the price which you received.

Mr. MATHEWSON: Yes, in taking the total at the outset we must take the smallest figure possible, and when you come to de-
3725 ducting in order to see what our present value is, you must take the higher figure.

Mr. BURR: We are not taking a higher figure, we are taking what you actually got for what originally cost you $158,000.

Q. Now, where did you get this $365,000 which you have deducted on account of the Little Italy Park?

A. I failed to have noted it, but I think it was in the testimony of one of the real estate experts.

Q. Was it not in the City Record or the city records showing the figures at which the property was condemned by the City, to wit, $365,000?

A. You are right.

Mr. BURR: In order to be correct, showing the award which was made for it by the City.

Mr. MATHEWSON: Yes, the award.

Q. You obtained then the $365,000 which you have deducted for Harlem land which was carried into the total originally at $158,899.81 from the City Record. Didn't you examine the City Record to find out how much of that $365,000 was real estate, that is land, and how much was something else? I see you have deducted the whole $365,000.

(At this point Mr. Page appeared.)

A. My recollection is very vague, but it was in part, I think, damages as well.

Q. Damages for what?

A. I cannot recall the total proceeding. There is $25,000 in there——

Q. As a matter of fact, Professor, the record shows from which you got this $365,000 total, that of that award $246,100 was for plant and only $118,900 for real estate.

A. Yes.

3726 Q. If that be true how can you deduct the entire $365,000, even on your theory, from the valuation of land, to get the balance of land which the company still holds?

A. On the same system of compensation which I have already mentioned, if this amount is included in the real estate and not in the plant, why the ultimate result would not be affected.

Q. We are dealing now simply with the valuation of the land that is left to the company upon the basis upon which you have proceeded to reach that valuation, and I ask you again whether you ought to deduct the entire $365,000 to obtain the value of the land left instead of $118,900 which was that part of the award which related to real estate.

A. Had I known this fact I would have separated the real estate from the manufacturing apparatus at the outset. But the result——

Q. But those facts appeared, the division appeared in the very document which you examined and from which you got the $365,000.

A. I beg your pardon. I said I had heard from a real estate expert, not that I had examined the document.

Q. Then this is something you obtained without an examination of the data yourself, is it?

A. It is.

Q. Don't you know, as a matter of fact, but a small part of the Harlem Company's real estate which altogether was included in Yalden's figures of $158,899.81 was condemned by the City in this proceeding, to wit, about one block out of four?

A. I was so advised.

Q. And the value of the property which was taken would naturally be only a fraction of $158,899.81, if it were valued on the same basis as Yalden's figures, would it not?

A. I beg pardon. The cost would be under your conditions, original cost, about one-quarter of $160,000, or about $40,000,
3727 and its value might be anything that a real estate expert might fix upon it.

Q. Now, your next deduction in making up your total deduction of real estate is for a parcel of land sold by the New Amsterdam Company for $180,000, which was appraised in 1884 at $130,000. Here again, do you take the figures at which that land was carried into your total by Yalden, or do you take a higher value since?

A. I take a valuation stated to me as the selling price, $180,000.

Q. Without any regard to the figure at which that was carried in your original total of $5,054,014.88, which you obtained from Yalden's tables?

A. Without any regard to Yalden's tables. In fact, all these tables on page 2364, including the total, have no relation whatever to Yalden's figures.

Q. Now, your next deduction was on account of bulkheads, at or about 21st street condemned by the city for $247,858. Was that again the figure at which those bulkheads were carried in Yalden's total or have you deducted these at a higher figure?

Mr. Burr: He has already said it applied to all these items.

Mr. Mathewson: I want to call his attention to them, there are only a few of them, so as to be sure we are clear about it.

The Witness: It has no relation to Yalden's figures.

Q. Now, your next two deductions are for bulkheads and land taken by the city at the 18th Street station?

A. Yes.

Q. Which you valued at $1,193,016.37. They are not carried at this last figure, are they, in Mr. Yalden's total of $5,054,014.88?

A. They have no relation to Yalden's figures at all.

3728 Q. Is this not a very much higher figure than they are carried in Yalden's total?

A. I could compare that if you wish.

Q. Is it not true that the value of all the land and bulkheads at the 18th Street station is included in Yalden's figures at about $473,000, and that your deduction now amounts to $1,193,016.37 for only a portion which——

A. If you will allow me to look at the book——

Q. Well, it may be a subject for computation.

A. North River property, page 674, Senate Document 47, which I presume is what you mean, appears to be put at about $473,000 by J. Yalden.

Q. Now, that is the entire property and yet, on account of the bulkheads and land which has been taken by the city there, constituting only a portion of the property you deduct $1,193,016.37, is that right?

Mr. **Burr**: There are other bulkheads and pier rights besides the North River.

Mr. **Mathewson**: This is the North River we are referring to now.

A. I deduct those figures because they were given to me by real estate experts.

Q. Where did you get the $1,193,016.37 which you deduct, what is your authority for that?

A. An extract prepared by one of the Corporation Counsel's assistants from the proceedings in condemnation between the city and the Consolidated Gas Company with regard to that property.

Q. Was that the highest estimate made by any one for the valuation for that property?

A. It was the one given to me at my request.

Q. And if you deduct this $1,193,016.37 while all the land and bulkheads at 18th Street were carried into your total of $5,054,014.88 as per Mr. Yalden at $473,173.51, this wipes out the
3729 entire valuation at 18th Street, as per Yalden and leaves a minus valuation of nearly $720,000, does it not?

A. An appreciation you mean.

Q. Call it what you please.

Mr. **Burr**: It is not a valuation, it is the difference between the original valuation and the price which you received for this property.

Q. And you will wipe out all our land and say we have nothing left, if you keep on. That would be the effect, would it not, Professor, to wipe out the entire valuation of all the land and bulkheads at 18th Street, as shown by Yalden, with nearly $720,000 on the other side?

A. Yes, but unfortunately neither the stocks nor bonds would be wiped out, which had been issued on it.

Q. That is too bad. And you noticed, didn't you that according to Mr. Wheelock that we still have land left there after this wiping out and after what is taken by the city of $1,714,000. Have you observed that?

A. I had noticed it was quite a valuable piece of property you had left.

Q. Now you also deduct the sales to the Standard Gas Light Company——

Mr. **Burr**: There were no figures given.

A. I beg pardon, that is not given.

Q. So you make no deduction for that?

A. I have no means of finding the price.

Q. Now, Professor, upon your own theories, don't you think it would be a fairer proceeding to take either Yalden's figures of 1884 and when real estate is deducted to deduct for that real estate the figures at which it entered into Yalden's total, or, on the other hand, to take the present value of the real estate and to deduct from such total present value the present value of parcels which are to
3730 be deducted? Don't you think that would be a fairer method of procedure, to pursue either one course or the other, consistently?

A. The change in the books in 1884 rendered shifting from Yalden's values anterior to 1884 to subsequent values to 1884 necessary. It is proper in the matter of the real estate to charge against it everything that it has cost and to deduct from it everything that it has returned by sales.

Q. But if you take a total representing original cost as you suppose in endeavoring to find the value of the property which the company has left in land, is it not a fairer thing to deduct from the total of original cost the items which are disposed of at the figures which they entered into the original cost instead of at the figures of the present valuation?

A. It is not usually done in business.

Q. You do not think that that is the thing to do?

A. It is not done as a matter of business.

Q. And your theory might result when we had sold a considerable amount of land at a considerable increase over the original cost in wiping out completely the original valuation instead of leaving it nearly $3,000,000?

A. I have been fortunate enough to have that happen in some companies.

Mr. **Burr**: Always bearing in mind the testimony in this case that the real estate is no more valuable to-day that it was in 1884 for gas making purposes.

Mr. **Mathewson**: Is that your testimony?

Mr. **Burr**: I am calling your attention and his to the testimony in this case.

Q. Now referring to Mr. Yalden's figures, have you made any comparison between the figures of different plants as employed by him to see whether they give internal evidence of being accurate costs and values or not?

3731 A. Mr. Yalden's report disclaims anything else but a faithful transcript of the original books of the first merged companies.

Q. Very good. I am very glad to have that statement. Now the question is whether those books showed the actual cost of the companies instead of something else. Let me call your attention to some things. The 14th Street real estate as it appears in the books of the Manhattan Company, the original company that owned it——

Mr. Burr: Where do you get these figures?

Mr. Mathewson: I am going to call attention to them.

Mr. Burr: We are very anxious to get them.

Q. (Continuing:) Appears on page 674, I think it *it*, of Senate Document 47 of 1886, at $376,495, does it not, that is the 14th Street plant?

A. What is that?

Q. East River property at 14th Street and East River.

A. Yes.

Q. Now look at pages 826 and 827 and see whether the number of lots there are not 228.

A. Real estate 14th Street, East River, total value of the 14th Street station, East River, $1,400,000——

Q. No, but we are simply dealing with the land value you have given from the schedule, and I am speaking about the number of lots. It is 228, is it not?

A. Do you wish me to add those up?

Q. I did not know but that the total might be there or it might be easily computable.

Mr. Burr: Do you want him to give the number of lots by addition and adding them up?

Q. Is it easy to state or will it require some computation?

The Witness: I will add them up for you.

3732 The Master: I want to put on the record now while I have an opportunity a suggestion that all the counsel in this case should, so far as possible, be getting ready their requests and perhaps their findings or a memorandum of matters on which they want findings. Of course it will be manifestly impossible for Senator Page and Mr. Kirby to do much at it until they get their evidence a little further in, but Mr. Mathewson can and Mr. Burr can. I suppose you could have some of your subordinates or assistants working on that outside of here, because when we come to close eventually you will be pressed for time on that, and I think you will find it to be more laborious work than you think, and if you could have some of your young men working on the more formal parts of it, you will save time. Of course there is a great deal of it which is merely formal, and you can get that done just as well now as when the case is all in.

The Witness: 288 lots, yes.

Q. And similarly, are not the 225 lots at 21st Street station, pages 845 and 846, I think, of the same document?

Mr. **Burr**: Might I inquire what the object of this is, because no doubt when he speaks of the 14th Street property he means all of the property. Are you speaking of the computation as to the lots, so as to call attention to the number of lots?

Mr. **Mathewson**: Yes, that is the purpose.

Mr. **Burr**: I do not think it makes any difference.

Q. Does it appear how many lots there were at 21st Street?

3733 Mr. **Burr**: This statement that the Doctor is reading from——

A. This 18th Street and North River seems to be the next one.

Mr. **Burr**: The paper which the Doctor has was prepared by Rowland and not by Yalden, and it appears in Rowland's inventory.

Mr. **Mathewson**: Merely as to the number of lots. There is no difference in their statement as to the number of lots.

The **Witness**: I count, page 845, Senate Document 47, 95 full lots and six gores.

Mr. **Burr**: As belonging to what company?

The **Witness**: The real estate inventory of the New York Gas Light Company.

Q. Well, we have seen what the 14th Street real estate was carried on the books of the Manhattan Gaslight Company at, that is, $367,495. Was not the 21st Street real estate, for a smaller number of lots, carried at $1,857,000, page 709, I think, of Senate Document 47?

A. Referring to what page of my testimony?

Mr. **Burr**: He wants to know if it was carried in the New York Gaslight Company's books at a certain figure and refers to page 706 of Senate Document 47. What was the figure?

Mr. **Mathewson**: $1,857,000 for the 21st Street property.

Mr. **Burr**: There are two items here, Hester Street property $100,000 and real estate at gas works $1,220,000.

Mr. **Mathewson**: Don't you find additional real estate there at the gas works, making a total of $1,857,000?

3734 The **Witness**: On page 709, under the item, "To Real Estate and Gas Works, State of Account prior to Credit of Appreciation, $1,220,000; appreciation written up $637,000——

Q. No, no. Now, wait a minute.

Mr. **Burr**: Let him finish.

Mr. **Mathewson**: No, I want an answer to my question.

Mr. **Burr**: But the figures you have asked for appears to be the amount at which it sold for, $1,857,000.

Mr. **Mathewson**: As appearing on the books of the constituent company.

Mr. **Burr**: That is what the land sold for.

Mr. **Mathewson**: Well, go ahead.

The **Witness**: Sold for $1,857,000.

Q. That means the figure at which the land was acquired by the Consolidated Gas Company at the consolidation, do you understand?

Mr. Burr: That means as this book shows, does it not, the state of account prior to credit of appreciation $1,220,000, and appreciation written up $637,000, sold for $1,857,000, as it appears by that record.

Mr. Mathewson: Yes.

The Witness: It means the relative value of the land of the New York Gaslight Company as compared with the valuations placed for stock distribution in all the companies.

Q. Now, we will reach the point which I was reaching, you having covered yours. If you take 14th Street land at $367,495, at which figure it was carried on the books of the original companies, and divide it by the 228 lots, it would appear that the lots 3735 were carried at 14th Street at about $1,622 per lot, would it not?

A. I will accept your figures.

Q. If they are wrong, you can correct them later, Professor.

A. Yes.

Q. And if the value of the land at 21st Street, just above, on the books of the original company, was carried at $1,220,000, and there were about one hundred lots——

A. Ninety-five lots and six gores.

Q. Call the siz gores full lots for this purpose—for 100 lots it would mean a valuation of about $12,000 per lot placed on that land, wouldn't it, on the books of the original company?

A. I will accept your figures.

Q. As compared with $1,622 at 14th Street. They are both on the East River, you understand, Professor, don't you, on the same side of the City?

(No reply.)

Q. So, too, please——

The Witness: One moment. We were talking about the real estate at 14th Street and also about the real estate at 21st Street?

Q. Yes.

A. Both, on the East River, apparently.

Q. Is it fair to say, Professor, that my computation, which I have not verified, shows the 21st Street lots to be a larger number and to be valued at somewhat less than your figures, but there is a very great discrepancy between the values at 14th and 21st Streets nevertheless, which is the point I was going to bring out.

Mr. Page: I was just going to call attention to the fact that there are several blocks which you apparently have not covered.

Mr. Mathewson: It is not a matter of exactness or a matter of which I desire to prove anything by the witness except that there is a large discrepancy in the figures at which the lots were 3736 carried on the books of the two comapnies in the same neighborhood.

Q. Now, taking the plants at 14th Street and 18th Street of the Manhattan Gas Company, they were both coal gas plants, you remember?

A. Yes, I remember.

Q. And you remember that their capacity was the same?

A. No, I do not.

Q. Did you observe the relative values at which these two plants, of what the testimony shows to be the same capacity, were carried on the books of the same company at?

A. Of each company do you mean?

Q. No, no; of the same company, because both these plants were owned and operated by the Manhattan Gas Light Company at the consolidation in 1884.

A. I beg your pardon. Can you refer me to the page?

Q. I think page 674 may show, and if I am wrong in my assumption that the capacity was the same in 1884, I wish to be corrected. Now, the plant as it was carried on the books at 14th Street, manufacturing building, when I refer to the plant I refer merely to the manufacturing building——

A. Referring to page 674, the two plants are given there after being subjected to appreciation and afterwards one of them to depreciation——

Q. I am speaking now of the values according to the books of the original company which you assume to be cost. Is it not true that the buildings at the 14th Street station, were carried at $75,197.54 according to Yalden's table?

A. East River property, buildings and improvements——

Q. $75,197.54.

A. Yes.

Q. Now what were the buildings at 18th Street carried at?

A. North River property at $372,621.46.

3737 Q. Now if those plants were both coal gas plants and of the same capacity, that discrepancy between the buildings, between one place and another, might indicate pretty loose bookkeeping, might it not?

A. It could indicate almost anything that you wish to attribute to it.

Q. You said a few moments ago that it would be all right if you deducted the $365,000, which represented both land and plant in the condemnation at 111th Street from the value of the land because it would not then be deducted for plant.

A. Yes.

Q. Now, as a matter of fact, did you not deduct the entire $569,000 representing the whole value of the 111th Street plant from plant also when you were dealing with that, on the theory that it had been abandoned.

A. Referring to page 2367, I there state that I have deducted $569,495.57, as the value in 1884.

Q. That was the entire valuation in 1884, according to Yalden's figures on that plant, wasn't it?

A. Yes.

Q. So that there does not seem to be any special compensation to use your own words, in that case, does there, where you deduct the value of plant, at 111th Street, from the value of real estate also?

A. If you are not aware of the fact that three-quarters of the land, a good gas holder, and a half completed gas-making apparatus was still in existence then.

Q. Yes, but I am getting at your theory of compensation. I do not see where the compensation comes in if you have deducted the entire Harlem plant from the plant account and subsequently deduct that which is condemned by the city, that is, the plant which is condemned by the city as well as the real estate condemned by the city, from the value of land also as you did when you took out the whole $365,000. Where does the compensation come in to 3738 which you refer?

A. In the residue which is of, I presume, very considerable value as it stands to-day.

By the **Master**:

Q. Where is the value in your figures represented?

A. It is left to them in the improvements and additions to their plant. $9,000,000—page 2367, there is $3,645,881 residue of the amount added for improvements left. Also at the bottom of page 2365 there is $10,737,418.70, the apparent cost of the six original plants at the time they were turned over in 1884.

By Mr. **Mathewson**:

Q. The point I am making is this: You said there was compensation when you took out the value of plant condemned by the city as well as land condemned by the city from the value of the land, thereby reducing the value of the remainder of the land which we had left, because if it were deducted there, it would not be deducted in plant. Now, as a matter of fact, you deducted the valuation of Yalden as to the entire plant from plant account, as well as deducting this whole $365,000, from real estate, did you not, and if so, where is the compensation to which you refer?

A. I could find it in a day in the books of the Consolidated Gas Company and this. It is very difficult to——

Q. I do not believe you could find the compensation, Professor, but I would like to know where it comes in. Certainly it is not compensation because we have got a little something left in hand.

A. (No answer.)

Q. Well, if you are not able to answer the question——

Mr. **Burr**: At this time.

3739 Q. (Continuing:) Further, I shall not press it.

A. It would be very easy to answer the question with sufficiently full figures from the books of the two companies. As I have said before, my figures were simply an exploration of a field with very insufficient equipment.

By Mr. **Burr**:

Q. As to data?

A. As to data.

By Mr. **Mathewson**:

Q. As to mains and services, I ask you whether you stated in substance in your affidavit that you had carefully recomputed the cost of the mains owned by the Consolidated Gas Company from the inventory given by Mr. Simpson and that you were of the opinion the cost of installation as given on the books of the company was probably correct and moderate?

A. I did. Assuming his figures to be correct.

Q. As to mileage and size?

A. As to mileage and size.

Q. And did you also state that Mr. Simpson's estimate of the cost of reproduction, $12,636,150.04, had been similarly checked and appeared to you to be moderate and fair, but unnecessary?

A. I did.

Q. Now, as to services, did you say in your affidavit, that Mr. Simpson's estimate of the value of the services of the Consolidated Gas Company 86,338 in number, at a book value of $1,212,071.09, appeared to be moderate and correct?

A. I did.

Q. Given an average of about $14 for each service, curb box and stop valve because it corresponded very closely with the average experience as to the cost of installation of services in other large companies?

A. I did.

Mr. Burr: He said that in his direct examination. He said that always assuming Mr. Simpson's figures and statements to be correct. 3740

Mr. Mathewson: Of course; as to numbers and so forth.

Q. You have, in the course of your testimony, mentioned $2 per thousand feet of sales as the value of the plant of the Consolidated Gas Company?

A. I have.

Q. Do you know of any engineer who uses the basis of $2 in the construction of gas works in any large city in this country to cover land, plant, mains, services, meters and everything else that goes to make up a complete operating company, and if so, will you name him?

A. Apparently the structures of the plants in Cambridge, Fall River, Lowell and Worcester——

Q. No, no, no. I am asking for some information of your own on that?

A. I never heard anybody enunciate it except myself; my own statement, for which I am responsible.

Q. And in connection with the cost of gas as well as pressure, did you state that while you considered it mechanically possible by isolating the gas mains of the Island of Manhattan according to their levels, and feeding each level by means of a separate feed main or mains, with the use of governors to come within the limitations of the law of June 3, 1905, it did not appear to you to be necessary and that any such attempt as this would be found to be commercially expensive and technically very troublesome in operation, without giving any return in real advantage or economical results to consumers (page 48 of affidavit)?

A. I did.

Q. And of course if it is commercially expensive and fully possible to be done the expense, so far as return on capital necessary to accomplish it is concerned, or the expense of operation 3741 & 3742 of the system when installed, would be a charge against the consumers of gas to be reckoned with in fixing the price at which that gas could be sold? That is a fair proposition, isn't it?

A. It is so.

Q. And isn't it true that in the gas business a company with a growing consumption prudently anticipates the future reasonably in the building of its manufacturing plants?

A. That is proper and wise.

Q. And I see that you allowed a certain addition to the plant owned by the Consolidated Gas Company amounting to about five and one-half million dollars to represent the plant which was used in the manufacturing of gas sold by the Consolidated Gas Company which it acquired from other companies?

A. I did.

Q. And it would not make any difference in your computation whether that plant were the plant of other companies or whether the five and one-half millions be located at Astoria and produced the same gas?

A. None whatever. The sources of the gas would have no consequence.

Q. And of course it would be part of the capital, whichever course were to be pursued?

A. Yes.

Mr. Mathewson: I think that is all, Mr. Burr.

Adjourned at 4:40 P. M. to Thursday, November 1st, 1906, at 10:30 A. M.

3743 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucien L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Thursday, *November* 1, 1906—10.30 a. m.

Met pursuant to adjournment .
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

3744 William D. Marks resumes the stand.

Redirect examination by Mr. Burr:

Q. I call your attention to the testimony on page 2595, given by you in reference to the structural cost of the Cambridge, Fall River, Lowell and Worcester Companies. In response to a question of Mr. Mathewson, you stated the apparent result from the figures previously given by you regarding these companies——
A. The Boston companies?
Q. The Boston companies, yes. "The apparent result from these figures, cost per thousand daily capacity $808.31, dividing by the capacity factor of apparent cost per annual cost, is $4.04."

Mr. Mathewson: That must be a misprint. I never said that.

Q. Well, you took the four Massachusetts companies and obtained, as I understand, $1.75 actual structural cost per thousand cubic feet?
A. I did.
Q. You added to this, making $1.78, so as to be liberal?
A. I did.
Q. The assumption in this question would make the apparent cost per annual thousand 4.04 in Boston, would it not?

Mr. Mathewson: No, no.

A. The figures given by Mr. Mathewson and the computations made by myself to assist him gave $4.04.
Q. As to Boston?
A. As to Boston.

Mr. Mathewson: It is $4.20, if you include all the gas assets in Boston. You should read the next question. That was merely certain assets.
The Witness: I was referring to the actual structural cost.
3745 Mr. Mathewson: Excluding cash on hand and things of that sort.

Q. Is the valuation of gas works per annual thousand cubic feet sold in Boston more than the proper valuation of gas companies in other Massachusetts cities of about 100,000 population?

Mr. MATHEWSON: That is objected to as purely a conclusion to be derived and determined by others, upon the facts submitted.

Mr. BURR: He can either say that it is or not. If he says it is I will ask him upon what he bases that statement.

The MASTER: The question seems to be objectionable, calling more for a conclusion than a matter of legitimate opinion. I will sustain the objection, give you an exception, Mr. Burr, and the answer may be taken down.

Mr. BURR: I will put it this way:

Q. Is the valuation of gas works per annual thousand cubic feet sold in Boston excessive, in your opinion?

Mr. MATHEWSON: I object to that. You asked whether it is greater than other Massichusetts companies. That is another question. The Professor has not indicated anything which qualifies him to make a statement of that kind.

Mr. BURR: I will ask him on what he bases his statement.

Objection sustained.

Mr. BURR: Exception.

A. Yes, it is excessive.

Q. Upon what basis do you make that statement?

3746 A. It is upon the statements made in the report from the Committee on Manufactures relative to the price of gas in Boston, June 11, 1900.

Q. Contained in what report?

A. On page 178, Appendix C, to the 16th Annual Report, Gas and Electric Commission of Massachusetts. That is for the year ending December 31, 1900.

Q. Will you refer more specifically to the statements in that report?

A. In the column headed, "Total Assets," in the table on that page——

Q. What does that column give?

A. (Continuing:) We find the total asset- of nine Boston companies. It is testified by Mr. F. E. Smith, assistant treasurer of the Boston, the Roxbury and the South Boston Companies, that it had been the practice of those companies to charge all new work to construction——

Q. Pardon me a moment. Let us get this straight. Will you commence the quotation from, "A word?" Proceed to quote from this report at the page stated.

A. "A word should be said relative to the column entitled 'Total Assets.' It was testified by Mr. F. E. Smith, assistant treasurer of the Boston, Roxbury and South Boston companies that it had been the practice of these companies to charge all new work to construction and to charge off nothing to depreciation. If this has been the system adopted, it follows that the book assets are largely in excess of the actual assets, for in the nature of things there must have been a substantial depreciation. The column entitled 'Accumulated Surplus' shows that these companies have, besides paying the dividends to their stockholders, accumulated from their earnings from consumers a large sum of money which is sufficient to secure 3747 stockholders from accidents or contingency and loss—a large sum for depreciation.

"A single exception must be made to this. The Brookline Company has no surplus. Its liabilities are $303,595.75 in excess of its assets. This grows out of the peculiar conditions under which the Brookline Company has done its business for the last seven years, which will be more fully explained hereafter. Of all these companies the Charlestown and East Boston are the only ones which are now under the management of boards of directors elected by stockholders who are residents in our own communities. Substantially all the stocks of all the other companies have been bought up by speculators and are pledged to two New York trust companies as security for large amounts of so-called stocks and bonds put out by the Bay State Gas Company of Delaware, a Delaware corporation, and the New England Gas & Coke Company, a syndicate of eleven trustees, nine of whom are not residents of this Commonwealth."

In addition to this statement, the Committee on Manufacturers states on Page CLXXIX:

"Certain important results of this quasi-consolidation may here be noted.

"In the first place, the manufacturing plants of the South Boston and Roxbury companies have been shut down, and thes- companies have bought their gas for some years from the Bay State Gas Company of Massachusetts."

And again, Page CLXXX:

"Your committee are of the opinion that there has been a considerable unnecessary duplication of capital by these means, 3748 and that justice to the consumer demands that if a gas company is to be permitted to disuse its own manufacturing plant and purchase its gas of another company, this arrangement should be made so as not to impose upon the consumer any unnecessary duplication of capital. The gas plants can (doubtful; substitute cannot) be maintained, but not used simply for the purpose of furnishing a basis of paying dividends upon capital, which may have been invested, but which is no longer used for the public benefit."

Again, Page CLXXXII, the Committee states:

"Owing to a contest between Mr. Rogers, or the Standard Oil interests of New York, and Mr. Addicks, the controlling spirit of the Bay State Gas Trust, the Standard Oil party bought the controlling interest of the Brookline Company and entered into competition in the Boston field, for the purpose of driving Mr. Addicks out of Brooklyn and Buffalo, New York."

Mr. Mathewson: I don't think that this has any weighty effect on the assets of the Boston Company or upon the question before the Master.

The Witness: "This competition had not as its basis any reduction in the prace of gas, nor furnishing to an unsupplied part of our

people lighting facilities; it was a speculative movement, pure and simple. This competition went on from early in 1893 until May, 1896. At the expiration of that period the Brookline Company had book assets, as appears from the table above, of $4,627,907.35, and liabilities of $4,931,503.10, showing a deficit of $300,000. Its actual assets are apparently considerably less. On its appli-
3749 cation to the Board of Gas and Electric Light Commissioners for authority to issue another $1,000,000 of bonds, the Commission did not find assets sufficient, in their opinion, in justifying them in the issue."

Mr. Mathewson: Are you reading from your notes?

Mr. Burr: No, this is all a quotation from the official report.

The Witness: "There is weighty evidence that the property of this company is worth $1,000,000 less than its books would indicate."

From a minority report of Charles F. A. Smith, of the same committee, page CCV, I take the statement:

"It would seem that still further opportunity for a reduction might be found, if some of the companies were made to dispose of certain property, which will practically remain idle, as they do not manufacture their own gas. Further inquiry along this line should have been made, but a premature closing of the hearings prevented this. The proceeds of any such sales should be applied to the payment of some of the outstanding obligations, and thus reduce the interest and capital charges."

From the above it is evident that the book account of the Boston companies merged into the Consolidated Gas Company are entirely unreliable as a basis of true cost of construction, and that the figures on the books are largely in excess of the actual structural cost of the works.

Q. And was it for that reason that you selected as a basis for comparison the four companies having a regular organization and
3750 a normal growth, the Cambridge, Fall River, Lowell and Worcester Companies?

A. I at first investigated Boston for the purpose of making a comparison, and finding the facts stated by the Gas Commission and recently quoted by me, as well as many others, I selected, because I believed that there had been an ordinary organization and a normal growth, the four companies in Cambridge, Fall River, Lowell and Worcester.

Q. And you deduced from them an average of $1.78 actual structural investment per annual thousand feet capacity, did you not?

A. I deduced an average of the totals of $1.75 and an average of the averages coming at $1.78, I accepted that as being more liberal and in favor of the companies.

Q. Have you any other authority for avoiding the use of the book accounts of the Consolidated Gas Company of Boston as a basis for the computation of the actual structural value of gas works in general?

A. Yes, the capitalization of the Boston Consolidated Gas Company was fixed by the State Legislature of Massachusetts at $15,124,-

600 for "All the property, locations, rights, licenses, powers, privileges and franchises of all the corporations mentioned in Section 1, Chapter 421, Laws of 1905, Massachusetts."

There is also the statement in the Act, "The Boston Consolidated Gas Company shall not be the acceptance of the capitalization herein furnished, be deemed to have admitted, for any purpose, that the par value of such capitalization is equal to the value of its property, or to the value of the property necessary for the proper conduct of its business." In fact there is, in my opinion, little doubt that works costing, as an actual structural investment, somewhere in the neighborhood of $7,000,000 or $8,000,000 would amply suffice to supply Boston's present annual gas requirements, or its total sales for 3751 the year ending June 30th, 1906, of 3,988,188,700 cubic feet, as reported by the Gas Commissioners.

Q. Is the distribution of gas in Boston any more difficult than in other communities?

A. The cost of the distribution of gas in Boston may be somewhat more difficult than in many more communities in the soil of which there is not a large proportion of rock or of made soil. I have estimated the above somewhat higher price——

Q. You mean the seven or eight million dollars?

A. Yes, a somewhat higher price per annual thousand cubic feet of sales than in the case of the gas companies situated in other towns in Massachusetts. I refer to actual structural cost.

Q. For that reason?

A. For that reason. I have, however, assumed that there shall be no duplication of gas mains as appears to be the case in the streets and that the capacity of the gas works of Boston shall be for a maximum daily demand of about 15,000,000 cubic feet, for the maximum demand reported for the year ending June 30th, 1906, by the Massachusetts Gas & Electric Commission, being very nearly 15,000,000, not quite.

Q. You are familiar with the recent proceedings in Boston on the petition of the Consolidated Gas Company to have determined the fair value of the plants and profits of its constituent companies, are you not?

A. I have read the proceedings of the Boston Consolidated Gas companies in the case of both petitions.

Q. To fix the price of gas and to fix the values of the plants?

A. Yes.

Q. For the purpose of capitalization?

A. For the purpose of capitalization, and at no time during these proceedings were the Commissioners of Gas and Electricity allowed to fix values, although they were experienced in the cost of 3752 Massachusetts gas companies, that is, if anybody could be said to be; nor in those proceedings did I find any attempt by a recognized commission or board of engineers, to fix the proper cost of an ordinary gas works and distributing system as would be required to supply gas to the citizens of Boston under the existing conditions.

Mr. Mathewson: You mean in the proceedings in connection with the consolidation of the companies?

The Witness: In the proceedings in connection with the consolidation of the companies, or the petition concerning the price of gas.

Q. Now, while on the subject of capitalization of the Boston Consolidated Company, and comparing that capitalization with the capitalization of the Consolidated Gas Company of New York, did or did not, in your opinion, the division of twenty million dollars in six per cent. debentures among the Consolidated Gas Company of New York stockholders result in excessive capitalization, and if so, in what way?

Mr. Mathewson: I object to that as utterly improper. There is no evidence that we have distributed twenty million dollars of debentures. The testimony clearly is that the company authorized twenty million dollars of debentures and sold nineteen million, eight hundred and ninety thousand dollars to their stockholders at par in cash and received the money and have spent seven or eight million dollars already in the Astoria investment, and have the rest in cash or temporary investments, as it is being poured in by further construction. Now, what possible propriety is there in a question
3753 of that sort or in a conclusion of the witness based upon that
assumption?

The Master: I think that is objectionable, Mr. Burr. You have the facts here about it. I do not see that the witness's characterization will add anything. I sustain the objection.

Mr. Burr: Exception. You may answer.

A. At the time of the allottment of twenty million dollars of six per cent. debentures by the Consolidated Gas Company of New York, to its stockholders, the stock of that company was selling on the market at an average very closely approximating 204 for each $100 share. These 6 per cent. debentures were convertible in 1907 into the stock of the Consolidated Gas Company and for that reason would naturally become a very attractive investment, commanding a large premium; and if they had been sold in the open market by the treasury for whatever they would have fetched, in my opinion they would have commanded a very large premium indeed, approximating to the premium of 104 then existing on the stock. The result would have been that the treasury of the Consolidated Gas Company instead of realizing exactly $20,000,000 from the distribution at par and paying six per cent. on it, would have perhaps realized twice that sum, or something less than twice that sum, ranging in cash something below $40,000,000, which would have been applicable for the purposes of the company without the capitalization being any more than $20,000,000 to procure it.

Q. Please turn to page 2448. You were asked this question: "You expect, do you not, that the investment of the Consolidated Gas Company in its manufacturing and distributing plant in 1907,
if its output is 15,000,000,000 feet or more, will be greater
3754 than the investment required to-day with its output of
13,000,000,000 feet or more?" To which you answered
"Yes." Do you wish to modify or explain that answer?

A. I would like to answer the question more clearly and concisely.

A plant having a sale of 13,000,000,000 cu. ft. annually will in my opinion cost about $26,600,000, and a plant with a sale of 15,300,000,000 cubic feet, will in my opinion cost $30,600,000, estimating the actual structural cost at $2.00 per annual thousand cubic feet of sales. Referring now to the sales of gas, if 13,300,000,000 feet of gas are sold at $1.00, the gross receipts will be $13,300,000. And if the cost of the gas is, as it appears to be, about 50 cents per thousand cubic feet for manufacturing, distribution and general management—I refer to the cash expenditures in the manufacture of gas—the net earnings on this will be $6,650,000. Again, if a plant sells 15,300,000,000 cu. ft. of gas at 80 cents, the gross earnings will be $12,240,000, and if the cost of producing this gas is 50 cents at the meter, the net earnings will be $4,590,000. It is probable, however, in the first case of 13,300,000,000 cu. ft. sales of gas——

Q. That is, the cost being 50 cents.

A. If the cost happens to be 50 cents, and that in the second case of 15,300,000,000 cubic feet sales of gas the cost will be substantially less than 50 cents per thousand cubic feet, and therefore the reduction in net earnings will be much less than the $2,060,000 which would appear in subtracting $4,590,000 from $6,650,000.

Q. The reduction of net earnings?

A. Yes.

Q. I wish you would just give us those figures. In the first case the gross earnings would be how much?

A. The results will be as follows. The first case, gross earnings $13,300,000, second case gross earnings $12,240,000 saving to consumers and reduction in gross earnings also $1,060,000. Another tabulation: In the first case the net earnings $6,650,000 for
3755 1905 and in the second case net earnings $4,590,000 for 1907.
Reduction of net earnings, $2,060,00- as above computed.

Q. In the first case what would the profit be?

A. In the first case the profit will be 25 per cent. on $26,600,000 and in the second case the net profit will be 15 per cent. on $30,600,000. And these figures would appear to me to be about the actual truth as to the situation of the Consolidated Gas Company to-day, and to show that as near as may be that the statement quoted from my written work on testimony, pages 2516 and following are correct. It was after investigating a very large number of corporations engaged in furnishing gas and electricity that these statements were made. And further——

Q. That the statement was made in your book?

A. Yes, these statements were made in the book, and, further, that this particular statement was made: "A corporation, capitalized only to the extent of its cash investments, restricted to a fair dividend of about 8 per cent. and a reserve of 7 per cent, for large renewals and repairs is a beneficent institution."

Q. Referring to page 2585 of the testimony, your attention was called to the affidavit which you made in this case and particularly to that part of it referring to the capitalization and dividends of the Massachusetts company to which you have referred. You gave the dividends per thousand cubic feet and also the capitalization per thousand cubic feet as taken from the report of the Massachusetts Gas and Electricity Commission, June 30th, 1904, pages 102 to 111 and 118. In that tabulation did you or did you not refer solely to that portion of it on which dividends were being paid?

A. Yes, and I endeavored to make it clear that the only
3756 object of the tabulated data given in my affidavit was to show
the dividends on stock in percentages and also the dividends per thousand cubic feet of sales. The rest of the tabulation is merely for the purpose of identifying and referring to my authority.

Q. If a franchise tax is assessed upon the stock of a company furnishing gas, is it, in your opinion, proper to charge the amount of this tax to the cost of manufacturing and distributing gas?

Mr. Mathewson: Wait a minute; is not that the purest kind of a conclusion? I object to it on this ground.

The Master: There has been that kind of evidence allowed, and I will let him answer.

Mr. Mathewson: Exception.

A. It is, for this franchise tax is in the nature of annual operating expense, and though the franchise, being a gift, should not be capitalized, any tax placed upon the theoretical value of this gift should be charged to the cost of operation.

Q. You do not adopt, however, Mr. Mathewson's theory, as I understand it, that the greater the increase in the value of real estate owned by the company becomes, the greater the cost of gas should become to the consumer by reason of the increase in capitalization of the company due to the increase in value of the real estate?

A. I do not for this reason, that the real estate used for the manufacture of gas in the case of the Consolidated Gas Company, at least, has always earned a profit on its purchase price.

Q. Well, but the taxes on this increased value are paid by the consumer, are they not?

A. They are.

Q. And should he, in your opinion, be compelled to pay the return upon such increased capitalization in addition?

3757 A. He should not. If he pays increased taxes, he should not pay increased profits on a problematical sale in the future, although, of course, it would be natural to sell land at a profit if he could.

Q. I call your attention to page 2531 of the testimony. You were examined at this point by Mr. Mathewson with regard to the situation in Philadelphia, as you had referred to it in your testimony and in the affidavit which was made in this case, and you were asked this question:

"Now, whatever gas the company delivered to the city is delivered, is it not, in whole or a part, as compensation or rental for the property or plant of the city which the company is allowed to use, and it is not given to the city at all, except as consideration for the use of the property, is it not? A. Well, I don't think that that is specifically stated. I wonder if I have the lease here. No, I haven't the lease here; I have it at my office.

"Q. Well, is it not your recollection that the gas is delivered to the city as compensation for the use by the company of the property of the city which the company uses? A. I know the gas is delivered to the city free of charge. I don't know——

"Pursuant to the contract under which the company uses the city's plant to manufacture the gas? A. Yes."

Now, do you wish to modify or explain or amplify your answer in that connection?

A. I do.

Q. Proceed.

A. In addition to the various sums of money paid by the United Gas Improvement Company to the city of Philadelphia and the $15,000,000 for improvements to be put into the works, as well as the free gas delivered to the street lamps and to the public 3758 buildings, the United Gas Improvement Company agreed at the end of thirty years to turn over the Philadelphia Gas Works to the city without any charge whatsoever or receiving any money in any form for it. Besides that, as showing how exceeding lucrative the past eight years must have been, the United Gas Improvement Company offered an additional sum of $25,000,000 in cash.

Q. When?

By Mr. **Mathewson**:

Q. Is this on record anywhere?

A. In my affidavit.

Q. Yes, but that is not a very valuable record for the purposes of evidence here. Is it in any other record or where is this offer found to which you are about to refer?

A. In the archives of Philadelphia.

Q. You have not the records here, have you?

A. No.

By Mr. **Burr**:

Q. When was this?

Mr. **Mathewson**: I think I shall have to object to this, Mr. Master. I do not know whether the so-called archives are available to us for explanation.

The **Master**: What do you say to that, Mr. Burr?

Mr. **Burr**: If he knows of this matter, I suppose he can testify to it.

Mr. **Mathewson**: I do not think it is competent. I have not made that objection in most cases, but here is something I know nothing about and he may refer to a record which is not available to us.

3759 Mr. **Burr**: You examined him very fully in regard to this situation and I am giving you some further information to explain his answers.

Mr. **Mathewson**: I have not asked him about that.

The **Master**: If this appears in any published proceedings such as we have hitherto used in this case, like those in Chicago, or Boston or elsewhere, it may go in, but if it is merely hearsay on the part of the witness, I think that objection will have to be sustained, Mr. Burr.

Mr. MATHEWSON: If the paper was here so we could see it and cross-examine upon it and put any parts of it in which we wish to, it might be another thing.

Q. Have you the annual report of the United Gas Improvement Company?

A. I have not. There was a printed cutting from it which was sent to me.

Q. Well, you have seen an extract from the annual report for 1905, have you, of this company?

A. The report of the United Gas Improvement Company at its annual meeting on May 7th, 1906, for the fiscal year 1905.

Q. Does it appear by that report what amount the company claims to have invested during the past eight years in the gas business in Philadelphia at six per cent.?

A. The amount is $16,018,192.22.

The MASTER: The question was does it appear upon that report?

The WITNESS: Yes.

Mr. MATHEWSON: That is all testified to in direct-examination and again in cross-examination.

3760 Mr. BURR: One point of your cross-examination was to show that this free light which was testified to——

The MASTER: Well, I have it before me, Mr. Burr.

Mr. MATHEWSON: I do not want to embarrass the witness or counsel as to this $25,000,000 offer which was said to have been made, and I am willing to say this, that I will not press the objection of incompetency as to the witness's testimony on that point, assuming that the testimony may be stricken out if we are unable to get the information ourselves.

The WITNESS: I see no reason why you could not get a copy.

Mr. MATHEWSON: I think perhaps we can, and I shall not press the objection if that understanding prevails.

Q. Now, in addition to this amount which you have stated as appears by the report this company invested in the gas business during the past eight years at 6 per cent., did it on April 26th, 1905, make an additional offer to the City of Philadelphia for an extension of its lease?

A. It did.

Q. Will you give us the particulars if you have them.

A. It offered an additional sum of $25,000,000 cash for an extension of its lease for fifty-three years, fixing the price of gas at $1.00 for five years, 95 cents for ten years, 90 cents for fifteen years, 85 cents for twenty years, and 80 cents thereafter. This would make the total investment which — claimed by the United Gas Improvement Company about $41,000,000, of which the treasury of Philadelphia would receive $25,000,000.

Q. So that it is fair to infer, is it not, from this offer, that the result of selling gas in Philadelphia at an average of 78.1
3761 cents as you have testified has proved enormously profitable?

Mr. **Mathewson**: I object to that, whether it is fair to infer.

The **Master**: Cannot I be trusted to draw that inference ?

Mr. **Burr**: Well, I will say, has proved profitable.

Mr. **Mathewson**: I make the same objection, that it is fair to infer. Is that a fair question?

The **Master**: I do not think that adds anything to the testimony.

Mr. **Mathewson**: Gas was never sold for 78 cents in Philadelphia, as the witness admitted on cross-examination. It is sold now for $1.00 to every consumer.

Mr. **Burr**: The testimony is that it is sold at 78.1 cents.

Mr. **Mathewson**: There is no such testimony.

The **Master**: I sustain the objection and you can have the witness' answer.

Mr. **Burr**: Exception.

A. It must be profitable or they would not offer to pay such a large sum for it.

Q. Now, referring to page 2477, as the result of previous testimony given by you in answer to the questions of Mr. Mathewson by which it was made to appear that $4,000,000 would be necessary for additional plant to meet the requirements of the additional consumption to which you had referred as being imminent in 1907, you were asked, referring to that $4,000,000 on page 2477: "Was it included in the $40,000,000 which you say were the company's figures?"

A. The company's figures have been taken by me at all times as doubtful and subject to verification. If I was computing
3762 the capacity of works which could be built for $40,000,000, stated structural cost, I would put the capacity at about 20,000,000,000 cubic feet annually.

Mr. **Mathewson**: The question is whether it was included in the $40,000,000 of the Company's figures.

The **Witness**: I would say that this $4,000,000 would by me be included in the $30,600,000 allowed as actual structural cost and also in any larger sum that might be suggested where the capacity was not greater than 15,300,000,000 feet.

Q. On page 2482, being still under examination with regard to your chart, showing the probable increase in sales for 1907, you were asked the question:

"The increase in the sales of gas which you say was due to the reduction in price. You gave the amount in your direct testimony and stated the increase of sales of gas in those two years was so much and that it was due to an increase in price.

"A. I gave the increase in the sales of gas per capita.

"Q. Yes, I mean per capita. A. At 929 cubic feet. You wish that divided by 50 cents?

"The **Witness**: That is about 18.6 cubic feet, one-fiftieth.

"'Q. Is it not the 929 feet that you divided by 33 to obtain 46.46? A. Yes."

Do you wish to add anything to that answer or explain it?

A. It was a fact that I divided 1533 cubic feet by 33 to obtain 46.46 feet per one cent of reduction in the price of gas. My reply was due to a misunderstanding.

3763 Mr. Mathewson: You fully explained that on the next page.

The Witness: It was an omission in the previous evidence.

Mr. Burr: Well, we wish to emphasize that evidence.

Q. On page 2485 you were asked, "Is it possible to maintain an average candle power of only 22½ candles monthly record, and at the same time at all times keep the candle-power on test by the city a mile from the works above 22 candles? A. There are certain periods of—— Q. I asked you a direct question. Will you not give me a direct answer for once? A. Yes."

Do you wish to explain that?

A. Yes, referring to Field's Analysis for 1904, page 2, we find the standard or prescribed candle-power to be 16 and the average furnished to be 16.52 candles. This is the Gaslight and Coke Company. Also referring to Field's Analysis for 1905, page 2, we find the standard or prescribed candle-power to be the same and the average furnished to be 16.48, showing the average furnished for the two years to have exceeded the standard of 16 candles by one-half candle and showing the practical possibility of realizing the result stated by me in the practical operation of gas works selling 22,500,000,000 cubic feet annually.

Q. Have you any further informtaion on this subject from the books of the Consolidated Gas Company?

Mr. Mathewson: What subject is that, about candle-power?

Mr. Burr: Yes.

3764 A. Yes. Since testifying I have been handed the monthly report of manufacturing averages and results of the Consolidated Gas Company for the year 1905.

Q. What appears from that?

Mr. Mathewson: Has that anything to do with candle-power? I thought this was redirect upon the subject of Professor Marks' testimony before the examination of the records of the Consolidated Gas Company and I proceeded upon that basis in my cross-examination. If you are going to inject on redirect new matter based on that examination, and then further new matter later based on that examination, it seems to me it will chop things up a good deal.

Mr. Burr: You have gone into the cross-examination of both Dr. Bemis and Dr. Marks as to candle-power and candle tests and he has made a statement here which you have challenged by your cross-examination. He now explains the statement made in response to your questions on cross-examination, and fortifies the position he has taken there by information which has come to him now and which he offers to produce here. I think that is clearly within our rights.

Mr. Mathewson: May I see what you propose to go into. I may not have any objection if you limit it.

Paper handed to Mr. Mathewson.

Mr. MATHEWSON: If this is limited, I am not going to object to this particular thing, but I do object to the principle very seriously. Here is Marwick, Mitchell & Company's accountants' statement, if the Master pleases, and Marwick, 3765 Mitchell & Company get this up while they are examining our books and pass it out for the purposes of this redirect-examination. I do not think it is the fair or proper thing to do.

Mr. BURR: I wish to protest against any such statement. We are either in the office of the company for the purpose of obtaining information or we are not. If we are there for the purpose of getting information, that information is for our use in this case; and if Dr. Marks asks the accountants to procure for him whatever information that could be procured with regard to these matters that are contained in this statement, that is not spreading it broadcast. That is for the use of the defendant, the City of New York, in this case, and it is for that purpose that I procured it, and it is for that purpose that I offer it as part of the record.

Mr. MATHEWSON: It is not a question of spreading it broadcast. It is a question of where I have been asked to cross-examine the witness to get that out of the way, and then your importing into the redirect-examination results of examinations regarding which I had had no opportunity in my cross-examination to deal with at all. That was something which was to be postponed. In this particular case I do not object to it, but I do not like the principle of the thing, and I shall object to its being done continuously, if it is attempted.

Mr. BURR: There is no intention on my part to do anything with regard to information that may be given by the accountants further than in this instance, but while we are on the subject of candle power——

The MASTER: Then there seems to be no substantial issue 3766 between you gentlemen as the matter stands.

Mr. BURR: I thought it well to have this information supplied to fortify, as I said, the position taken by Doctor Marks.

Q. Referring to that statement which you have produced, you may state what it is?

A. It is a tabulation of the monthly record of manufacturing averages and results of the Consolidated Gas Company for the year 1905.

Q. By stations?

A. Showing the data for the five manufacturing stations, given separately.

Q. Taking the 14th Street station for the year 1905, what does the yearly average appear to be there?

A. The yearly average appears to be 25.62 candles, and the highest average is for the month of July, 30.38 candles.

Q. And for the other stations?

A. For the 21st Street station the yearly average appears to be 26.03 candles and the highest average 27.72 candles for July. For the 42d Street station the yearly average appears to be 24.25 candles and the highest 26.36 candles for July.

For the 44th Street station the yearly average appears to be 25.32 candles and the highest 28.06 for July.

The 99th Street station, the yearly average is not complete but in part appears to be 25.24 candles, with the highest average for the month of July 27.19 candles.

Q. The average of the whole year for all stations appears to be what?

A. Average candle power, coal and water gas stations, is 25.35.

Q. What is the average of candles above the average legal requirement of 21 candles for the year?

A. The average of the legal requirement is 21 candles, being 20 during the first six months and 22 during the last six, which 3767 shows an average excess of about 4.35 candle power throughout the year. I have already stated that I believed the candle power to be unnecessarily high and the use of oil extravagant, and offer this to substantiate it, outside of the records of the City which I used in making my first statement.

Mr. Burr: I offer that in evidence.

Received in evidence and marked City's Exhibit 62.

Q. I call your attention to page 2498 of the testimony where you were being examined regarding the price of oil and as a conclusion of the answers which you gave before, Mr. Mathewson says:

"If that statement is correct then the price paid by the Consolidated Gas Company for oil within that period, 4.08 cents, was considerably less than the average price paid by all the other companies in the State of New York, 4.25 cents, is not that true? A. That is true."

Do you wish to explain or amplify that answer?

A. Yes. In no case was I dealing with the average of the whole State. I tried to make it very clear that the use of oil was relatively so enormous in New York that the Consolidated Gas Company should have received a price far below that received by any other small corporation using oil in the manufacture of gas. In order to show that this difference in the stated price of oil, given by Brown's Directory, does not appear to be a matter of locality, I have prepared a map of the State of New York, giving the localities and prices paid for oil, and it will be observed that those companies paying 4 cents or less for oil are intermingled with companies paying over 4 cents, and quite regardless of geographical position. From this it might be in- 3768 ferred that the price of oil depended largely on the care exercised in its purchase, and not upon the location of the town in which it was bought.

Q. Will you produce the map, for the inspection of the Master, showing the geographical location of these cities?

A. (Producing map). The red ones are over 4 cents, the black ones are 4 cents or below.

Q. A good deal of time was consumed by Mr. Mathewson in examining you as to what you meant by the word "surplus," and on page 2503 of the testimony he said:

"I am trying to find out what you mean and what you refer to in your testimony and nothing further. I read from page 2823 as follows: 'By the Master: Q. What you mean by that is that the surplus has been expended in the purchase of securities of other com-companies? A. Yes, sir.' Now, what surplus did you refer to there which has been invested in the securities of other companies? Didn't you refer to the surplus which the Consolidated Gas Company had made in its gas business, because it had no other business until it invested in the securities of other companies? A. I referred to its visible possessions, State's Exhibit B, page 382."

Now, in what sense did you use the word "surplus" in that connection?

Mr. MATHEWSON: If he did not explain it in the next three or four pages of his testimony, he never can.

A. My use of the word "surplus" was clear to me in the ordinary business sense, as being any sum of money which a firm or corporation had invested outside of and beyond the capital demanded 3769 in the transaction of its professed business. In the case of the Consolidated Gas Company, I meant to convey that, if the Consolidated Gas Company had invested in other than gas enterprises, any sums, no matter from what source these sums were derived, or how they were obtained, they would form a surplus above its requirements.

Q. In what manner does the word "surplus" touch upon the future profit from gas manufactured, of the Consolidated Gas Company?

A. If, however, as appears from the books, the source of profit in the Consolidated Gas Company was almost entirely the manufacture of gas, and its investments in other enterprises returned very small or no dividend, then, in addition to the surplus already referred to and defined by me, it appears to have mortgaged for the future the surplus profits of the gas business in paying dividends on a very large capitalization, far beyond the needs of the gas business alone.

Q. Can you put this in a more concrete form?

A. Yes, the Consolidated Gas Company appears to have issued $80,000,000 in stock and $20,000,000 in six per cent. debentures, and to have recently paid eight per cent. on $8,000,000 or $6,400,000 annually, and six per cent. on $20,000,000 debentures or $1,200,000 annually, a total of $7,600,000 annually, all of which would, with the exception of the one million dollars received from electric light company investments, appear to be derived from the profits of the gas business. Eight per cent. on $30,000,000 which is the amount fixed by the Gas & Electricity Commission as a proper capitalization, is $2,400,000, which subtracted from $6,600,000 leaves $4,200,000, which might be called surplus profit derived from the gas business, over and above a fair rate of dividend from a proper capitalization, as stated by the Gas & Electric Commission.

3770 Q. Referring to your testimony on page 2533 I think you have already stated that it is a fact that at the end of thirty years the U. G. I. Company is to return the gas works free of all charge and without the payment of any money whatever, to the City of Philadelphia?

A. I have.

Q. Referring to your testimony on page 2551, and your testimony as it appears there regarding the gas works at Worcester, Massachusetts, and your statement that the Massachusetts Gas and Electricity Commission might have reported the capacity as too much, do you wish to explain further in that connection?

A. Yes. It would appear to me in taking the statement of the Gas and Electric Commission, knowing as I do that they have the statements from the various officials of the various works as there was at that time no particular reason to bias them, that the statements made by the managers were about averages. In the case of the Worcester Company I would say that the actual structural cost of the Worcester Gas Works appears to be $1.54, per annual thousand, and that the average which I have used is $1.78, and therefore that there is an excess allowance of 24 cents in the average used above the Worcester Gas Works stated actual structural annual cost per thousand cubic feet; that is the actual structural cost as reported by this company.

Q. At pages 2558 and 2559, you were being examined regarding the cost of the real estate of the Consolidated Gas Company and your comparison of the conditions which existed in Massachusetts with the conditions which existed here, so far as the Consolidated Gas Company is concerned, in the Borough of Manhattan?

A. In explaining that I would say that the cost of real estate is taken per annual one thousand cubic feet of capacity and that it appears generally——

3771 By Mr. Mathewson:

Q. Where is it taken here? In your testimony?

A. In my testimony.

Q. Pages 2558-9?

A. Yes. And as a result where the output or sales become very large the land is also apt at the same time to become valuable, increase in value, except under exceptional circumstances, so that there is a counterbalancing of the two factors which perhaps can be best illustrated by a reference to the 21st annual report, Massachusetts Gas and Electric Light Commissioners, for the calendar year 1905. On page 117 of that report the total sales of gas—not the total capacity, but the total sales of gas—are given as 10,410,000,000 cubic feet in a year in the whole State of Massachusetts. Now this does not differ very far from the amount of gas stated to be actually manufactured on the Island of Manhattan by the Consolidated Gas Company's stations.

Q. That has already been referred to at length.

A. (Continuing:) and I am also advised that the 10,410,000,000 Massachusetts sales has in it a duplication to a very considerable amount, which would reduce that. If the two quantities happen to be about equal though, then according to my method the value of all the real estate used by all the gas companies of the State of Massachusetts would have to be about the same as the value of the Manhattan real estate owned by the Consolidated Gas Company, since the output or sales of gas by all the companies in Massachusetts is about the stated sales of gas manufactured on the Island of Manhattan.

Q. Now referring to page 2561 and page 2355, a mistake appears there in enumerating the consumers' deposits of the Fall River Gas Company, does there not?

A. There is.

Mr. MATHEWSON: I called his attention to the fact. He 3772 misplaced an amount and he corrected it on that page and on page 2562. Instead of $429.85 it should be $2,193.

The MASTER: That is corrected on page 2562.

The WITNESS: And on page 2355 the total of all four companies should be $638,928.81. I would also add that the error is so small that the result of thirteen cents per annual thousand cubic feet sold does not differ but very slightly—immaterially—from the first figure found.

Q. Nor would 4.78 cents differ materially from the figure found, would it?

A. No.

Q. When you include the notes payable?

A. No, not a particle.

By Mr. BURR:

Q. Now, if you subtract the total of these floating liabilities, $638,928.81, from the working capital, $852,249.94, you obtain $213,321.13, do you not?

A. Yes.

By Mr. MATHEWSON:

Q. In place of $215,084.28?

A. Yes, sir.

By Mr. BURR:

Q. That representing the active capital furnished by stockholders for the needs of the gas business?

A. It is.

Mr. MATHEWSON: He changed that and said he had made a mistake and did not include notes payable. Are you going to have him testify to that over again and have me correct him again?

Mr. BURR: You have desired a change of notes payable into a bond?

3773 Mr. MATHEWSON: Not at all. I take the Massachusetts Commission's estimate of notes payable as capital.

The MASTER: That was made very clear, I think.

Mr. BURR: I think so.

Q. If you divide this amount, $213,321.13 by the actual total annual sales, 1,653,012,000 feet you obtain what?

A. Thirteen cents per annual thousand cubic feet sold. That is the amount of capital found to be necessary to be obtained from stockholders.

Q. Turn to page 2565, where you were asked to distinguish if you could tell the difference between working capital and active capital. What have you to say as to that?

A. I would say that a working capital is whatever fund is required to move the business of the gas company along, no matter how obtained, and that the active capital is the raised capital contributed by the stockholders, but not invested in permanent works or plants. The fact is that the Massachusetts companies appear to utilize a working fund of 48 cents per annual thousand cubic feet of sales, of which they have raised as active capital by stock subscription 13 cents and by borrowing in various forms 35 cents. In my opinion borrowed money is a liability and until funded in some form of long termed security must be reckoned with as a possible quick liability at any time. The fact that the Commissioners in Massachusetts or their statistician chose to regard what was stated on the balance sheet as notes payable as bonds does not convert notes payable into bonds.

Q. Referring to the subject of consumers' deposits on page 2570, Mr. Mathewson asked you this question:

3774 "Then the company would not be entitled to earn in that event on the money that it used as working capital merely because it was really a fund which was constituted by consumers deposits, is that right? A. I could give you a concrete case, in the case of the Consolidated Gas Company, if you like.

"Q. No, I don't want a concrete case. I am asking you what your testimony is, because it bears directly upon your testimony given here."

Do you desire to make any statement with regard to consumers' deposits?

A. Yes.

Q. Can you give me a concrete numerical statement of your views as to the use of consumers' deposits?

A. Yes. The custom seems to vary in gas companies regarding these deposits, some companies paying interest on these deposits, and other companies returning them without interest. These companies consumers' deposits are an insurance fund, and by some companies are set apart as a special deposit drawing interest, and by others are used as part of the working capital.

If the gas company received interest on its special deposits, and does not pay interest, it received a profit on capital which it has not contributed. If the gas company received interest, and pays equal interest on a special deposit, it has then the benefit only of an insurance fund. If the gas company uses the consumers' deposits as a working capital, but does not pay interest, it is not entitled to a profit on the amount of the consumers' deposits. If the gas company uses the consumers' deposits as a working capital, and pays interest to the consumers, it will appear proper that an allowance should be made of this interest to a consideration of profits justly to be claimed 3775 by the company. All this, however, is a matter of the profit and loss account, and should not enter into the cost of gas.

In making use of the word "insurance" I would say that insurance resulting from a consumer's deposit differs from fire insurance because the party who insures against fire does not put the total amount of that insurance in the hands of the party insured, while the consumer making a deposit to insure the gas company against loss does so by putting the actual cash of his deposit in the hands of the gas company, thus furnishing capital as well as furnishing insurance.

Q. Mr. Mathewson again adverted to the subject of notes payable on page 2579, but I think you have already fully explained your views on that subject in connection with the Fall River Company, and that also applies to the Cambridge Gas Company, does it not?

A. It does.

Q. That is, that the balance sheet of that company shows notes payable and you claimed that notes payable are not bonds, no matter whether the Massachusetts Gas Commission or any other parties may chance to call them so.

Mr. MATHEWSON: When you say "the balance sheets of the company," do you refer to anything more than is published here in this volume of the Massachusetts Gas & Electric Light Commissioners?

The WITNESS: All to which I have had access.

The MASTER: I do not get the point of the answer on page 2579. As I understand it, the Massachusetts Gas Commission does not say that notes payable are bonds, they simply include them as capital.

Mr. BURR: But Mr. Mathewson claimed that notes and 3776 bonds were, for the purposes of the Gas Commission, regarded by them as capital.

Mr. MATHEWSON: Notes payable. Notes payable are limited under the term "Capital per thousand sold, including bonds." In other words, they are included in the term "capital," not in the term "bonds."

The WITNESS: May I explain to you in regard to the matter that in Massachusetts, with the exception of Boston, the companies are thoroughly under the control apparently of the Massachusetts Gas Commission, and this Commission prevents them, until they can make a good showing of assets, from issuing further securities and the consequence is that they borrow money on notes more frequently than companies do elsewhere.

Mr. MATHEWSON: I am glad to hear that they are under the control of the Gas Commission. Professor Bemis seemed to object to my use of the word "permit," and so forth, in connection with the Gas Commission.

The WITNESS: With the exception of Boston, I said.

Mr. BURR: What he meant by control was that they might limit their prices.

Q. On page 2583 you were examined with regard to the capitalization of the Consolidated Gas Company of New York and its comparison with the existing conditions in Massachusetts and you made some statement on that page with regard to active capital and borrowed capital and the division of the same. Will you explain that if you can?

The MASTER: Exactly what, Mr. Burr?

Mr. BURR: As regards his division of the two.

3777 Mr. MATHEWSON: He merely explained there——

Mr. BURR: How would he divide the figures that he gives there into active capital and borrowed capital so as to show the total working capital?

A. Referring to the amount of $6,375,918.52, figured at the bottom of page 2583, I have recomputed it somewhat more accurately and put it in concrete form to correspond with existing conditions in Massachusetts. First, active capital furnished by stockholders $1,726,811.32, borrowed capital or working fund $4,649,107.20, making a total working capital of $6,375,918.52, which would appear to be the amount of free funds, investments, bills, liabilities and so forth required under the same conditions as those in Massachusetts, by the Consolidated Gas Company of New York City. The difficulty with this borrowed capital is that its destination in Massachusetts is not stated. That is, the way it is used; whether for the purchase of materials or the transaction of business or whether invested in a fixed or in a new plant. It may be used for either one or may be used for both, according to the necessities of the company and its future plants.

Q. Now in your chart showing the probable conditions of the gas business in 1907 in the Borough of The Bronx, and the examination of Mr. Mathewson regarding the figures which you gave as applicable to what you computed as to consumption of population, your attention was called to a report of Burr, Herring and Freeman, particularly as to the statement contained in that report as to what the probable population would be of the Borough of Manhattan in the year 1825. Have you looked into this matter of population any further because of your attention having been so drawn to
3778 that statement in that report?

A. Yes, I have. Taking a good deal of trouble looking the matter up, procuring from the department the copy of Burr, Herring and Freeman's Report.

Q. What do you find that report to be or to be based on?

A. It is a collection of papers from various parties, as well as from the gentlemen named. I find that they give as the authority Appendix 10, but it is so carelessly put together that on referring to Appendix 10, I find it to be a list of the employés of the Water Department. They also——

Mr. Mathewson: You do not understand that that 1925 is to be made up exclusively of the employés of the Water Department?

Mr. Burr: No, but that may be the reason for the increased water supply.

The Witness: (Continuing:)——tracing it further, I find that Messrs. Burr and Herring have relied entirely on Mr. Freeman who published a report in the year 1900. This report of Mr. Freeman in the year 1900 was with regard to the future demands of water anticipated on the part of Greater New York.

Q. You mean the future demands for water?

A. Yes, on the part of Greater New York. Mr. Freeman has laid off in a diagram a number of curves, stating that the increase might be 20 per cent., twenty-five per cent., or thirty per cent. in a decade, and he has started from existing conditions in each of the boroughs, considering them, and then proceeded on these assumptions to prophesy as to the future, but in the case of the Island of Manhattan

Mr. Freeman announces there are to be a very large indefinite number of bridges and apparently cut it off at 2,130,000 population.

3779 By Mr. MATHEWSON:

Q. For 1925?
A. For 1925. That is some twenty years from now.

By Mr. BURR:

Q. In other words, at a certain period the Borough of Manhattan will begin to be depopulated?
A. Yes.
Q. Now, have you consulted any other report in addition to the report of Mr. Freeman?
A. Following this very unsatisfactory investigation and result and method I visited Mr. Diverona, the head of the Water Department of New York and found that he had completed and had in manuscript his prognostications with regard to the future of New York, but it was not yet published.
Q. Did you take any figures from his report?
A. Mr. Diverona had quite a number of figures but as my own work was very narrowly limited, I simply took his figures for 1906, Mr. Diverona's that is this year, the end of that year.
Q. He is the chief engineer of the Water Department?
A. He is the chief engineer of the Water Department, and he says the population of the Island of Manhattan will be 2,464,000. For the year 1907 he states that the population will be 2,541,000. In my own case, reasoning closely but perhaps with not as great facilities in the matter of data, I obtained on the diagram 2,217,295.
Q. There is a difference of how much between your estimate and Chief Engineer Diverona's?
A. Making a difference of about 124,000, that I am below Mr. Diverona's figure. Regarding this chart and populations on it, I would say that it is only one of many charts covering the whole of Greater New York that I have made. And in getting out this
3780 chart I was very careful to hold myself to numerical figures, that is to say in anticipating the population I only anticipated it for two years beyond 1905, that is to the end of 1907, and I took the population for five years back, the difference in populations, and divided it by five and then multiplied it by two and obtained a uniform period of seven years from end to end, five back and two ahead, which I think gives very close and very conservative results as to population.

Now, in regard to the question of the increase per capita, I took as you know the increase per capita for two years only. Of that two years only twelve months was a period which involved a reduction in the cost of gas. Now, for that reason, I was obliged to confine myself to two years because there is but one year of 80 cent gas which is hoped for ahead. Of course at the end of two years of 80 cents gas I presume that the sales per capita would be considerably more than the 10,000 which is about what I had reached.

Recess until 2.15 P. M.

After Recess.

William D. Marks resumed.

By Mr. Burr:

Q. Your attention was called yesterday in the cross-examination by Mr. Mathewson to the manner in which stove rentals were treated under the English system as appears by Field's Analysis. Have you any comment to make in that regard, regarding stove rentals or stove repairs?

3781 A. Referring to Field's analysis, pages 3 and 4, it will be observed that on page 3 the average stove rental of the Metropolitan Company is .82 of a penny per thousand cubic feet, and on page 4, that the average stove repairs is .74 of a penny per thousand cubic feet of sales; the result being that the two amounts very nearly equal each year, and, in my opinion, is the result of an endeavor to neither make nor lose money on stoves, put out for the purpose of increasing the sales of gas.

Q. In your opinion, if I understood you correctly yesterday, you stated with regard to repairs to gas stoves, that that should be part of the expense of a plumbing department and should be a matter which would be closed out in the profit and loss department?

A. I did, and I think anybody else trying the experiment will find that it is clearer and better. Unless that is done you never really do know the precise amounts of money you are making or losing until at the end of the year.

Q. And I understood that was your opinion also with regard to the item of consumers' deposits?

A. Yes, sir; that they should go to profit and loss account.

Q. You explained, I think fully, yesterday your opinion, as to what should be done with interest on unpaid taxes in that, if I understand you correctly, that was a proper charge to be entered in and kept in suspense account?

A. Yes. It appears to me to be almost a matter of course. Were it not suggested, I cannot imagine any business man or bookkeeper doing otherwise, than placing it in suspense account, until matters were finally adjudicated.

Q. And on page 3670 of your testimony yesterday, your attention being drawn to the item of $289,000 lamp account, public lamps, as chartered in Exhibit 94, Mr. Mathewson said:

3782 "Well, you know in the present case the money is charged but not yet paid to the company."

Do you understand that that appears in Exhibit 94 because that money has not yet been paid to the company or do you understand that the Consolidated Gas Company claims that that is a proper charge in the operating expenses and indirectly to be charged up against the cost of gas?

A. The street lamp account is usually a separate contract account against which is charged all the expenditures and to which is credited all the receipts. The difference between these two at the end of the term of the contract or at the end of a fiscal year is closed by a balance, which balance should either be charged or credited to profit and loss according as to whether the contract results in a loss of money or in a profit.

Mr. Burr: That is all.

Recross-examination by Mr. Mathewson:

Q. You understood my question yesterday to be, did you not, Professor, as to whether stove repairs were carried into the expenditures for gas and stove rents were carried as income instead of carrying in the balance between the two as you advocated?
A. Yes.
Q. And you found that in Field's Analysis they did carry the stove repairs as part of the cost of the gas and carried income separately as an income, you will remember, didn't you?
A. May I look at my papers?
Q. Yes.
A. Yes, but——

The Master: Now, Doctor, remember that we have very little time this afternoon. Just answer the questions and Mr. Burr will take care of you.

3783 Q. It does not appear by Field's Analysis that their method of treatment of stove rents and stove repairs depends upon the amount of one as compared to the other, does it?
A. It does not.
Q. And in some companies as appears by Field's Analysis the stove rentals appear to differ very substantially from the amount of stove repairs?
A. Referring to what?
Q. Page 4, for instance, for the South Metropolitan Company, stove rental amounts to 1.03 pence and stove repairs to only .76 of a penny?
A. For what year?
Q. 1905.
A. I judge that is an exceptional instance.
Q. Take Brentford, the first of the suburban companies, it appears there that the stove rentals is .81 of a penny while the stove repairs are 2.14 pence or more than 2½ times as great, is not that the fact?
A. I referred more particularly——
Q. Is not that the fact?
A. That is the fact.
Q. So that it does not appear that there is any difference in the method of treatment of stove rents and stove repairs by the English accountants, depending upon whether one is greater than the other or not. That is so, is it not?
A. I referred in my testimony——
Q. Won't you answer my question. Is not that the fact?
A. I cannot draw that inference because I don't know how that is treated.
Q. But you have used this book and commented upon it. Won't you point out any case in which the stove rent and stove repairs is

treated differently by reason of any variation between the amount of the two items so far as it appears in Field's Analysis?

A. I don't know of that. I mentioned the facts in the case of the Metropolitan Company.

Q. That they happened to pretty nearly balance in that case?

A. For the reason that I stated.

3784 Q. You have referred to Burr, Herring & Freeman's report? Who is Mr. Freeman, do you know?

A. Mr. Freeman is an engineer and specialist in hydraulics.

Q. And has been connected in an advisory capacity with the defendant, the City of New York, for a considerable time, hasn't he?

A. I don't know. I know he has done work for the City for some time.

Q. Did you find that Mr. Verona's figures or estimate of the population of the Borough of Manhattan were carried up as far as 1925?

A. They were not.

Q. Don't you know that in many portions of the Borough of Manhattan in many districts the population is decreasing, as the census has shown, from year to year?

A. I have not made a sufficiently careful study of that to be sure on that point.

Q. In computing the assets per thousand of capacity in the Boston Consolidated Gas Company you have employed 28,000,000 feet as the daily capacity?

A. By your request.

Q. Well, what should be the daily capacity according to your investigation?

A. I have that memorandum somewhere but not with me.

Q. Is it not a fact that the 28,000,000 feet included the capacity of the New England Gas & Coke Company, which is not a part of the Boston Consolidated Gas Company at all?

A. (No reply.)

Q. You say you have read over the Boston testimony, Professor, and it all appeared in the Boston testimony?

A. Frankly, the 28,000,000 cubic feet of which you speak, is to my mind a quantity which is in excess of the Boston make, as near as I can recall having read it.

Q. Is it not your recollection that the total capacity of the Boston works, excluding the New England Coke & Coal Company, which is not part of the Consolidated Company, is something like 21,000,000 or 22,000,000 feet per day?

3785 A. I have not the figures with me and would not care to venture on a guess.

Q. I think the figures appear in the Boston testimony, which you said you had examined, and I thought perhaps you had noted the capacity?

A. It is a question of memory entirely. I can look it up if you like.

Q. But your memory being, and I think it is correct, that the capacity of the Boston Consolidated Gas Company's plant is actually less than 28,000,000 feet, if the capacity items were corrected to the fact, it would show a larger amount of assets per thousand feet of capacity than that which you gave, would it not?

A. Acting as your computer, and dividing a smaller amount into the amount which you gave me as their assets, I presume the result would be larger.

Q. I did not give you anything as their assets. I asked you to look at the Massachusetts Gas Commission report which you had been using as to other companies, and you will remember you took the assets from that, did you not?

A. Acting as your computer, solely.

Q. Yes. But you took the assets from the Massachusetts report and not from me, didn't you?

A. Yes, acting as your computer.

Q. And on the other hand if the 28,000,000 cubic feet daily capacity includes the New England Gas & Coke Company's capacity, that is, if you use the 28,000,000 feet as the divisor, you should also include the assets of the New England Coal & Coke Company, to be consistent, should you not?

A. I presume you are right, if you wish me to compute.

Q. No, I do not. I am merely getting at the principle. I am not trying to entangle you, but am merely trying to get at the facts.

3786 Now, you said that the Boston assets per thousand feet you considered excessive and stated your reasons why. Will you let me see that book from which you read incorporating some report from the Committee on Manufacturers of the Massachusetts Legislature?

(Book produced by witness.)

Q. Do you remember the date of that report?

A. It is at the head of it.

The Master: 1900, was it not?

Mr. Mathewson: Yes, June 11th, 1900.

Q. Now you referred to nine Boston companies in this connection. To what Boston companies did you refer as the nine companies?

A. As given in the list.

Q. On page 178?

A. Yes.

Q. Bay State, Boston, Brookline, Charlestown, Dorchester, East Boston, Jamaica Plains, Roxbury and South Boston. Now, you don't understand, do you, that those nine companies are all part of the present Boston Consolidated Gas Company?

A. I do not.

Q. So that any remark generalized on those nine companies would not necessarily be applicable to the Boston Consolidated Gas Company, would it?

A. The two companies, East Boston and Charlestown, mentioned in the list on page 178 are comparatively small companies as compared with the others which are in the Consolidated Gas Company and therefore would have very little effect upon the totals which are mentioned in this table as the rest of the companies, I think are all in the Consolidated.

Q. Do you know that the Massachusetts Pipe Line Company, which is not mentioned in this table at all, is also one of the constitutent companies of the Boston Consolidated Gas Company?

A. I do.

3787 Q. Now, in connection with these nine companies you took occasion to say that the assets were less than the capital stock as I understood you. Is that correct?

Mr. Burr: He read from the report.

A. I quoted——

Q. I understand, but I am asking if that is a correct statement?

A. I quoted the report to that effect.

Q. To that effect?

A. Yes.

Q. Let us see if that is right. This you will remember was in 1900. It states here that——

Mr. Burr: What are you referring to?

Mr. Mathewson: To the same document, pages 178 and 179.

Q. That it had been the practice of the Boston Roxbury and South Boston Companies not to charge anything to depreciation but to charge all new work to construction. And you observe too at the top of page 179 that it says these companies had accumulated a large surplus?

A. Yes.

Q. So that if the companies instead of charging down their plant to depreciation by a certain amount had instead of that accumulated an equivalent amount in surplus they would be just as well off, would they not, as though they did not show that surplus item, but had charged down the corresponding amount in depreciation?

A. The Committee does not think so, and so states.

Q. Well, don't you think so now?

A. I agree with the Committee.

Q. Then if the plant of a company had shown a depreciation to the extent of $200,000 and had charged it down to that amount and shown no surplus, you don't think that company would be as well off as though it had charged down nothing to depreciation and showed a surplus of $200,000, do you? And if you don't think it would be as well off, I would like to know why? 3788

A. Because in the case where there was a depreciation which was not properly charged off the books would be sophisticated——

Q. No matter about the books being sophisticated. I am asking you a straight question, Professor. Will you read the question which I did ask?

(Question read by stenographer.)

The Witness: That question is not clear. There seems to be a contradiction in it.

Q. Are you unable to answer it?

A. Kindly read it by sections.

(The stenographer read part of the question as follows: "Then if the plant of a company had shown a depreciation to the extent of

$200,000 and had charged it down to that amount and showed no surplus"——)

The WITNESS: Charged what down?

Q. The plant down by that amount?

A. The plant account or capital account?

Q. Yes, either you please, both, each.

A. Reducing the assets by $200,000?

Q. Charged it down $200,000, the book assets that I am referring to, yes, if you please.

A. Now the next section.

(The stenographer then read the remainder of the question as follows: "You do not think that company would be as well off as if it had charged down nothing to depreciation and showed a surplus of $200,000, do you?")

The WITNESS: In using the phrase well off, do you mean well managed?

3789 Q. No, I mean as well off in assets.

A. I presume there is no practical difference in reality if there is an actual surplus instead of a credit upon the books.

Q. But you observe at page 179, that the Committee find that these companies have, besides paying the dividends to their stockholders, accumulated a large sum of money which is sufficient to secure the stockholders and so on—"a large sum for depreciation," so that you see in that case the Company had actually accumulated a surplus according to the report of the Committee, had they not?

A. It is so stated, but the figures bear no proper relation to the actual condition of the companies and do not relate these conditions accurately.

Q. Do you consider capital stock in accounting and bookkeeping as a liability against assets?

A. It is usually written as a liability.

Q. Pardon me?

A. It is usually written as a liability.

Q. Well, generally speaking, in bookkeeping, when you show your assets on one side of the account, you show on the other side corresponding items of liability which include obligations of various kinds, including capital stock, don't you, in order to produce a balance?

A. In order to produce a balance.

Q. Now, you have referred to the Brookline Company and commented upon the Brookline Company, which is one of the eight companies which formed the Boston Consolidated Company, as having assets less than the total liabilities, in other words, as having a deficit instead of a surplus, but you did not call attention to any of the other companies. Now, I want you to look at this table on page 178, showing the nine companies, and say if every other one of the eight companies therein mentioned does not have a surplus above its liabilities, in other words, whether the assets of each one of

3790 the other eight companies do not exceed not only the capital stock but the total liabilities of the company?

A. Yes, and it is so stated by the committee quoted from.

Q. So that taking those companies together it does not follow at all their assets are less than their capital stock or less than their liabilities including capital stock, does it?

A. I was speaking of the book assets given in the tabulation on page 178, headed "Total Assets."

Q. That is what I am talking about. So that it appears by the final column, does it not, that these nine companies had accumulated surplus, that is to say, assets over liabilities in each case to the following extent:

Bay State.................	$252,730.44	Surplus
Boston	4,564,059.83	"
Charlestown	87,681.85	"
Dorchester	210,307.04	"
East Boston...............	79,071.22	"
Jamaica Plains............	156,449.68	"
Roxbury	431,506.36	"
South Boston..............	148,120.97	"

Against which is Brookline with a deficit of $303,595.75, or a net surplus of the nine companies above liabilities of $6,233,523.14. Is not that right?

A. No.

Q. Is not that total right as it appears in that column or have I misread it?

A. The strongest possible imputation of sophistry——

Q. Will you be kind enough to answer my question and not argue about sophistry, because I shall have to argue about that if you do?

A. Repeat the question.

The Master: Is the total right, is the question.

3791 The Witness: No.

The Master: Where is it wrong?

Q. Will you read the total in the last column——

Mr. Burr: The Master has asked where is it wrong.

The Witness: The total is $6,233,523.14, and you have spoken of a surplus. It is a correct book account. I will not acknowledge it is a surplus in existence.

Q. Did the committee in dealing with these companies have anything else before them so far as appears from this statement and from their report except the reports of these companies to the Massachusetts Gas Commission?

A. I know nothing more than the Committee states.

Q. Very good. Now let me read:

"The following table computed from the returns of these companies to the Board of Gas & Electric Light Commissioners for the year ending June 30th, 1899, discloses some of the most important facts relative to these companies."

Then immediately after that follows the table to which I have called your attention, does it not?

A. Yes.

Q. So that this surplus "Accumulated surplus" in the last column amounts to something like 50 per cent. more than the total liabilities including capital stock, does it not, of those nine companies?

A. Do you refer to the figures there or do you refer to the existing surplus?

Q. I refer to the figures there, which are the only figures
3792 that the Committee had before them or upon which they comment.

A. The figures there $6,233,523.14, appear to be in the neighborhood of two-thirds of the actual stock, $9,000,000.

Q. In other words, the capital stock of the company appears, does it not, to be $9,029,600 by this table?

A. Yes.

Q. And the total liabilities including capital stock appear to be $13,709,206?

A. Yes.

Q. And the accumulated surplus of $6,233,523.14 would be something like 66 per cent., would it not, of the capital stock?

A. 66 per cent. of the capital stock is about $6,000,000.

Q. And about 50 per cent. more than the total liabilities of the company, which includes capital stock?

A. About——

Q. Six is about half of thirteen, isn't it?

A. About half.

Q. Well, about 50 per cent. more, yes, the surplus was about half.

A. Yes.

Q. Now, as a matter of fact, Professor, you know, don't you, that the present assets of the present Boston Consolidated Gas Company as they appear in the report to the Boston Gas Commission to which you have referred are not an aggregation of the assets of the six companies that entered into that consolidation as per the books of the constituent companies?

A. I am not posted on the details of that account.

Q. You know, do you not, that an appraisal was made of the assets of all the companies—there were eight instead of six, I think, which formed the Boston Consolidated Gas Company—and that the assets of those companies upon their books are the result of such a distinct appraisal without any reference to the amount of paper that was outstanding of the constituent companies. Don't you know that?

3793 A. I am not familiar with the details of the opening of the books of the Boston Consolidated Gas Company.

Q. But as we are dealing with assets and not as to how much paper may be out representing them, if that assumption is correct that I have made, that is to say that there was an appraisal as shown by the testimony before this tribunal, you would not get very much aid from going back to the paper capitalization of the eight companies, in ascertaining the present value of the structural assets of the Boston Consolidated Gas Company?

A. The present value of the structural assets of the Boston Consolidated Gas Company could be obtained by a fair and careful appraisal.

Q. Yes, and don't you know that the structural assets, as they appear in the report to the Gas Commission, and to which I called your attention in that volume are the result of an appraisal of the assets of the Boston Consolidated Gas Company, or don't you?

Mr. Burr: This volume?
Mr. Mathewson: No, not this one, but for 1905.

Q. If you don't know whether that is so or not, Professor, there is no use in wasting time on it.
A. I know that they are the result of a compromise between the corporation counsel and Mr. Snow largely, afterwards acted upon, I believe, by the State Legislature.
Q. And who is Mr. Snow?
A. Representing the Boston Consolidated Gas Company.
Q. Now, you say that at the time of the Boston consolidation, the Massachusetts Gas Commission and the Legislature acted carelessly and without thought in fixing the capitalization. Is that what I understand you to say or did you mean——
3794 A. No, I said that the Gas Commission was not allowed to act.
Q. But, as a matter of fact, after such investigation as they saw fit to make, the Legislature passed this act to which you have referred, did it not, providing for a capitalization of $15,000,000 and more for the Boston Consolidated Gas Company with the proviso that the company by accepting that, should not be held to admit for any purpose that the assets were not in excess of that sum?
A. No, were not equal to that sum.
Q. Look at that book and see.

Mr. Burr: If Mr. Mathewson insists upon it, you might read from the book as to the appraisal.
The Witness: Equal.

Q. (Handing book.) See if that is right. "Said Boston Consolidated Gas Company, shall not, by the acceptance of the capitalization herein authorized, be deemed to have admitted for any purpose that the par value of such capitalization is equal to the value of its property or to the value of the property necessary for the proper conduct of its business." That is correct, is it not?
A. Yes, equal.
Q. That is substantially what I asked you. I put it the other way around, that is all.
A. The two things are not equal, they may be either greater or less.
Q. Well, I am willing to leave that construction with the Court as to what the Company intended to provide or protect itself. Now you have made an estimate in Boston or for Boston in which you said, that two dollars per annual thousand feet capacity was enough for Boston?
A. Actual structural value.
Q. You say in that estimate you have eliminated mains.
3795 What mileage of mains did you eliminate?
A. Duplication of mains.
Q. Don't you know in order to produce competition in the City of

Boston that the Brookline Company before consolidation was authorized to lay mains through the City of Boston paralleling to a considerable extent the mains of the Boston Gas Light Company?

A. I knew that the Brookline Company did parallel a great many mains in Boston, but that was only in a general way. I did not go into the details of it.

Q. Do you think that after a company has paralleled the mains of another company for the purpose of inducing competition, that those mains should be eliminated from its capital account as you have done if you have eliminated parallel mains?

A. In making the statement that I did make that for actual structural cost between $7,000,000 and $8,000,000 would suffice for the real needs of Boston, I made a statement or an estimate of about what would be required to meet the actual needs of Boston without any surplus as matters go in a rude way to-day and to avoid any misunderstanding as to taking what was under the ground for a basis of my figures, I added the phrase, eliminating duplication of mains.

The MASTER: I do not understand any better than I did before what your position is on the question Mr. Mathewson asked you.

The WITNESS: Will you kindly read the question.

(Question read by stenographer.)

The WITNESS: If they are not required they should be written off as to value.

Q. But they were required while the Brookline Company was delivering gas, were they not?

3796 A. I presume they were required by the Brookline Company.

Q. And don't you know that the mains of the Boston Gas Light Company were not sufficient to take care of the output at the time of consolidation even in the streets where it was paralleled by the Brookline mains?

A. Nobody could know the details of any of these large cities unless they were engaged in actual operation or had made a special and careful quantative study of the situation.

Q. Have you made such a special and careful quantative study of the situation in Boston?

A. Referring to what particularly?

Q. Your estimate of $2 per thousand feet of sales as the basis of capitalization?

A. I have spent a good deal of time in Boston looking over the ground, not in connection with this matter at all, but in past years in connection with electrical matters which gave me a good general idea of what the possibilities in the way of gas would be in Boston. My statements, as you know, claim to be nothing more than average and a generalization.

Q. Well, did you not find out whether the Boston Gas Light Company's mains were sufficient to supply consumers in the street through which they passed without recourse to the Brookline mains, did you?

A. I did not. And in my estimate I paid no attention to it.

Q. In your estimate of $2 per thousand feet for actual structural cost in Boston what costs per foot did you put upon the mains which you supposed would be necessary and what was the schedule of mains as to mileage of each dimension?

A. In a general way the large table which I have already handed to the Master of the cost of laying gas mains served the purpose.

3797 Q. Well, but the large schedule that you have handed to the Master as to the estimate of laying mains in New York was an estimate of the cost of laying mains originally before any of the present pavement existed in Boston or New York, wasn't it?

A. It covered every known form of pavement with the exception of the recent wooden pavement which I omitted.

Mr. Burr: When you say "schedule" you refer to the chart?

The Witness: Chart, yes.

Q. I would like to know in making this estimate for Boston, how many miles of 36-inch main you computed and how many miles of 12-inch main you computed, and at what cost, in other words, the figure for each main and each class of main?

A. It would be a very difficult matter to do anything more to average up as I did.

Q. You did not go into that subject in making up your two dollars per thousand feet as the capitalization for Boston, did you?

A. The probable cost for mains, do you mean that part of it?

Q. I mean the total mileage required and mileage of each size of main required, and the cost per foot of each class of main?

A. I looked up the statement made, I think it was by Mr. C. J. R. Humphreys, if not, it was by someone else, as to the actual existing mains in Boston and printed in that testimony——

Q. I would like to have you state how much the mains in the City of Boston under your estimate of two dollars to cover everything——

A. Will you allow me to finish?

Q. I thought you had.

A. And getting at those and getting a fair general idea, I made such an average check estimate as seemed to me would serve the purpose of trying out my two-dollar actual structural cost per thousand cubic feet and that was all there was to it.

3798 Q. Can you tell how many miles of mains are required in the City of Boston?

A. I cannot, without going over it again and taking what there is there.

Q. Have you the details here?

A. Why, certainly not.

Q. Did you consider the location of the various works in reference to the distributing system, the distance for the transportation of gas in detail in Boston?

A. Why, certainly not. There were half a dozen places around Boston that would appear fairly decent and some of them are mentioned by the Commission here as being ideal. If I remember rightly, they mentioned the North End station or something like that.

Q. And you know the North End station is the one station that is going to be abandoned because it is found in practice that that is not so available as any other, don't you, or don't you know that?

A. Certainly, I don't know it.

Q. Well, it is the fact.

A. I could never tell what they would do next in Boston, by any possibility.

Q. I don't think you would want to let contracts without a more careful estimate, Professor. Now, you referred to the $20,000,000 debentures of the Consolidated Gas Company which have been sold to stockholders at par in cash. You understand, don't you, that under the laws of the State of New York the company might have issued its stock to stockholders and got one hundred dollars per share, that is, got par for it, and have been entirely within its rights?

A. I presume it can do it.

Q. You know there is no law here as there is in Massachusetts compelling even the selling of capital stock at a premium, don't you, or has not been before the recent Act?

A. I am not an authority on the law. I will consult some good lawyer if I wish to be advised.

3799 Q. But you are criticising the acts of the company as though you did know it. Now, what we are dealing with here, you know, is the value of the assets of the Consolidated Gas Company. Does it make any difference in the value of the plants of the company as they exist whether the money was received from debentures or from stock or whether it was received from stock sold at a premium or stock sold at par?

A. It would make a great deal of difference as to how much premium you got out of the sales of stock.

Q. It would make a difference in the amount of paper you had outstanding or representing it in the shape of either stock or debentures, wouldn't it?

A. Yes.

Q. It would not make a particle of difference, would it, in the value of the property after it was constructed whether the paper was issued at par or above par, would it?

A. It would furnish more money and build bigger works.

Q. Won't you answer my question. It would make no difference in the value of the plant of the company after it was constructed and in operation whether the stock was sold at par or above par?

A. You mean in the cost?

Q. Yes, the value and cost of the plant of the company?

A. If a plant cost a million dollars it would make no difference in its cost how you got the money.

Q. Precisely. It would not make any difference in its value as a plant how you got the money, would it?

A. Well, that is rather deep. I presume not.

Q. Now, you have referred to real estate of the company as not capitalized at what you consider the six original companies paid for it. I refer to land when I speak of real estate. And you have said increase in the value of land should not be considered. Do you

mean to say that if the company has land worth $15,000,000
3800 which it can sell in the market for that price or which it
could lease on a basis of that value that it can receive a return
on only $5,000,000 merely because it is put to the use of the public of the City of New York instead of to the use of some other individual?

A. Yes.

Q. In other words, they are cut out of a fair return on the value of their property as it exists to-day merely because they are serving the public. That is the proposition, is it?

A. No, I will explain if you care.

Mr. Burr: Suppose you explain.

The Witness: When property is bought for the purpose of manufacturing upon it gas or electricity, for instance, it is fairly assumable that the profit is made year by year on the amount of the investment. If this property should be so very fortunate as to increase greatly in value, there certainly could be no objection to its being sold at this increased value and a second profit being obtained, the profit due to its sale. But if the property is assessed at a higher value than its cost, it is anticipating a sale and assessing the consumer for a problematical profit, when that has not yet been realized, in addition to heaping up on him what will probably have to stand, the increased taxes, due to the increased assessment of the property.

Q. I am not talking about the assessment. I am talking about the value. I am assuming it is proven before this tribunal or any other that the value of the land of the company which it has to-day is $15,000,000, that being the price at which it could sell it or leave it or use it in any other business. I understand your proposition to
be that because the public uses it in a certain sense we can
3801 get a return on only, say, five million dollars as representing
land?

A. On the cost.

Q. If that be the cost?

A. Yes, if that be the cost.

The Master: I do not think he used the word "assessment" in the sense of for purposes of taxation.

The Witness: No.

Mr. Mathewson: He spoke of taxation later, which led me to suppose that he did. I did not think so at first.

Q. If the company sold the land and realized a profit in that way, it would be necessary, of course, for it to establish a gas plant somewhere else, would it not, if it continued in business?

A. It might be forced out of business by the competition of electricity.

Q. But do you think it would be a matter of economy for the consumer if the company sold its land and thereby virtually lost its entire investment in plants, and had to establish an entirely new plant on other land that it purchased at even a considerably smaller valuation?

A. I would be glad to take up any practical instance of that sort that you can suggest and give it careful consideration. But this is purely an academic discussion of a baseless theory.

Q. You think so, but you have opened the theory itself and I am going to see where we get to. You say the company can realize a profit on the land when it sells it.

Mr. BURR: You formulated the theory yourself and he stated on the redirect-examination that he disagreed with you and gave his reasons.

3802 Q. I am now asking the Professor whether it would be a matter of economy even to the consumer if the company were compelled to sell its land and transfer its plant or rather establish its plant at another point in order to get the value of its land to itself as it exists?

(Previous question repeated.)

A. That might be done with beneficial results all around but generalizing is not possible and in order to offer an opinion the specific conditions must be stated.

Q. But the plant in the present case you computed to be, even on Yalden's figures plus subsequent additions, something more than $12,000,000, and practically all of that plant would be worthless, would it not, if it were necessary to abandon the present manufacturing stations?

A. I can answer that question after the appraisal made by the State's experts——

Q. I am assuming the figures that you yourself made up, and whatever the value is found to be it would virtually mean a wiping out of the entire investment if we had to go to another manufacturing point and abandon this, would it not? In other words, they would not bring anything practically would they, in addition to the bare value of the land.

A. I am not so sure. I have not had a chance to look over your place yet. I have done a good deal of thinking about that thing and it might be an exceedingly profitable move.

Q. Well, Professor Bemis and everybody else seem to agree that if you abandon a manufacturing plant that you can sell it for the bare value of the land with practically nothing for the plant. In other words that the plant is valueless except for the purposes of operation as it exists. Is not that true?

3803 Mr. BURR: Professor Bemis drew the distinction whether it was a going concern or was going to close up its business.

Q. Do you agree with that proposition?

A. Will you read that question.

(Question repeated.)

A. Not as a generalization.

Q. Well do you as a particularization?

A. There may be some instances in which that is true, but I do not think with the conditions as they are in the Island of Manhattan, that we can afford to say anything of that sort.

Q. You don't think you can move the manufacturing plant at 14th Street from 14th Street to any other place, I mean the physical property, the buildings, the machinery and other things there?

A. If you will pardon me, I will not answer that. I have given it a good deal of thought.

Q. But you are not prepared to answer that?

A. I am not prepared to answer that until I have given it more thorough thought.

Q. Now you have referred again to Philadelphia. If the city of Philadelphia terminates the lease there before the expiration of the thirty years, the city must take over, must it not, the additions which have been made by the U. G. I. Company at the cost to the U. G. I. Company and 6 per cent. interest?

A. That is at the end of ten years; it is possible, on giving notice, for the city to recover the works.

Q. To terminate the lease and then they have got to take over these additions made by the U. G. I. Company with 6 per cent. interest.

A. Paying for additions and improvements. If, however, the city omits to give them notice, then the lease runs for thirty years and
the works are returned to the city of Philadelphia at the end
3804 of thirty years without one dollar of payment of any sort or
kind.

Q. You understand that the works belong to the city of Philadelphia anyway, do you not, and what I am speaking of are merely any additions that may be made thereto by the U. G. I.?

A. They are pledged to make $15,000,000 additions, and to pay a number of large salaries.

Q. There is a case where, at the end of thirty years the fixed period, the U. G. I. may be out a certain amount of their investment. Have you made any computation as to what would be required in a sinking fund to cancel that expenditure at the end of thirty years?

A. No.

Q. You don't know what that would represent in cents per thousand in the cost of gas?

A. I am not a believer in computations of sinking funds.

Q. You don't agree with Professor Bemis then on that theory.

Mr. Burr: Where does Professor Bemis refer to that?

Mr. Mathewson: He says he does not agree with it.

The Witness: I said I was not a believer in computations of sinking funds.

Q. You do not mean you are not a believer in sinking funds but merely not in the computation, is that right?

A. Yes. I believe in their existence.

Q. When you refer to the 78.1 cents in Philadelphia, you obtained that, did you not, by dividing the receipts from private consumers by all the gas manufactured by the company, including that to the City of Philadelphia?

A. Yes.

Q. You refer to the standard of candle power in Great Britain and have mentioned some companies as showing——

A. One company.

3805 Q. One company, as showing that it runs with a furnished candle power of one-half candle power above the required power?

A. Yes.

Q. That shows the least difference between the prescribed and the supplied candle power of any one of the three suburban companies, doesn't it?

A. Yes.

Q. And do you observe that taking the Brentford Company, the supply is 15.6 candles and the prescribed is only 14 candles; do you observe that?

A. Yes.

Q. And that the Bromley Company has a supply of 16.75 candles as against 14 prescribed; did you observe that?

A. Yes. Mr. Mathewson, I have observed the whole column all the way down, every one of them.

Q. I am glad to know it because you didn't mention them. I didn't know as you had observed these others. Now, don't you know that the gas which is supplied in London is an unenriched coal gas and does not derive its candle power from the use of oil, except possibly one or two companies which use a very slight amount of oil?

A. I know it is largely coal gas but not unenriched coal gas.

Q. Do the Commercial or South Metropolitan Company, two of the three Metropolitan companies, enrich their gas?

A. The Gaslight Coke & Coal Company enriches its gas by the use of oil and spirit; the Commercial——

The **Master**: Doctor, that was not the question.

Mr. **Mathewson**: I asked about the Commercial or South Metropolitan.

The **Witness**: The Commercial enriches its gas by the use of oil.

Q. To what extent and where do you find it?

3806 A. On the 16th page, 1905, appendix A, "details of coal carbonized and oil and spirit used."

Q. Yes. Now, what enricher do they use. Oil?

A. Oil.

Q. Does the South Metropolitan use any oil?

A. Apparently none.

Q. Then that apparently does not use any oil for enrichment, does it, as far as you observe here?

A. My statement is based on the Gaslight and Coke Company above.

Q. But my questions are based on the Commercial and South Metropolitan?

A. The South Metropolitan does not use any enricher nor have I referred to it in my testimony.

Q. Don't you know, Professor, that it is very much easier to maintain a furnished candle power close to the prescribed candle power where the prescribed candle power is 14 than it is where the prescribed candle power is 22?

A. It is perhaps a little more difficult. It is all a matter, very much like a man shooting at a mark, of skill; and it can be done by properly skilled men. The fact that a great many men cannot hit a mark does not prove that the mark cannot be hit by a properly skilled man. I refer now to the illuminating power as the mark.

Q. Now, what is the answer to the question?

The MASTER: That seems to be responsive.

Q. It is perhaps a little more difficult. That is your answer, is it?

A. Not all of it.

Q. It is more difficult, is it?

A. It is perhaps a little more difficult but it can be done.

Q. Isn't it a great deal more difficult?

A. No.

3807 Q. Don't you know that oil gas or gas which is enriched by oil to a high candle power drops its illuminating power much more readily in passing through mains than an unenriched or slightly enriched coal gas of 14 or 15 candles?

A. I know that there is a difference.

Q. Don't you know that?

A. I know that there is a difference of the nature of a percentage difference.

Q. Do you know what the penalty is in London for failure to meet candle power requirements?

A. Practically none, I understand, worthy of consideration.

Q. Is not the candle power which you have given here an average candle power as supplied?

A. Yes.

Q. Do you know how often in London the tests showed that these fell below the 14 or 16 candle power which was required?

A. You mean the average?

Q. No.

A. The individual instances?

Q. Yes.

A. That would be impossible without careful investigation of the original tests.

Q. And if you had a thousand dollars penalty for each offense where a company fell below 22 candle power, it would be necessary and prudent, wouldn't it, to keep the candle power higher to insure a better margin than as though you were subjected to practically no penalty if you fell below the 22 candle power?

A. It would require greater vigilance. I don't know that it would require a greater margin.

Q. And do you not know that the London testing stations are so arranged as to receive the gas after it has traversed a long distance and when ordinarily all the dropping which is to be expected in candle power between the works and testing stations has occurred?

A. No, I was not posted on that.

Q. Is not condensation a factor in dropping of candle power and isn't that due to the low temperatures which prevail in New York below the temperatures which prevail as a rule in London in winter?

3808 A. There are so many factors entering into that question of illuminating power, particularly some that render the condensation that is spoken of so much not the controlling factor.

Q. Now, will you refer to the City's Exhibit 62 in reference *in* the

City of New York which you say was a tabulation from the company's books. By whom was this prepared for you?

A. By Mr. James Hall.

Q. Of Marwick, Mitchell & Company?

A. Of Marwick, Mitchell & Company.

Q. They are the accountants who are now looking over the books of the Consolidated Gas Company?

A. Yes. It is a copy.

Q. You state here that the average candle-power, coal and water gas stations, for the year, appears to be 25.35 candles. Was that the average of the candle-power at the city testing stations or was that the candle-power at the works of the company before the gas had been sent into the mains at all?

A. The candle-power just outside of the works.

Q. Before the gas was sent into the mains for distribution?

A. I understand that it was not in the works but immediately adjacent to the works. I am not especially familiar with it.

Q. Do you know whether this candle-power represents only results at the works or at the city testing station which must be at least a mile from the works?

A. It is not the city testing station.

Q. There will be a substantial drop between the works and the city testing station a mile from the works, will there not?

A. That is a theory that would have to be tested.

Q. Well, don't you know it to be a fact that there will be and always is a drop between the works and testing station if the station is located a mile or more from the works of the company?

A. You said a substantial drop.

3809 Q. Yes, I will put it in that way?

A. You said that.

Q. Yes.

A. I except to that. There will be a drop. How much I do not know.

Q. You know the maximum candle-power for various stations, all these candle-powers, except those appearing in the column "City test" are candle-powers at the works of the company, are they not?

Mr. Burr: They are not city testing stations.

A. Only one city test in it.

Q. And the others are at the works?

A. The others are at the works, and the city tests are not complete.

Q. You haven't any data here showing how low the tests were at the station or how low they were at the works?

A. Those are averages of which the details are all in the possession of the Consolidated Gas Company.

Q. And you understand that the penalty under which the company labors if its candle-power falls below the requirement is imposed in accordance with the results of the city test a mile from the works but has no relation to the candle-power of our gas at the works, do you not?

A. According to City's Exhibit 62, the candle-power city test shown for the 99th Street station is given on that average as being

25.24 candles, and the candle-power station test which is immediately in the vicinity of the station is 25.52, showing a drop of .28, about one-quarter of a candle occurring in the mile travel from the 99th Street station.

3810 By Mr. Burr:

Q. To the city testing station?

A. To the city testing station.

Mr. Burr: But he said it is not based on the test at the works.

The Witness: Excuse me. He said it has no relation to the city test.

Q. No, I said the imposition of the penalty is based upon results found at the city testing station and has no relation to the candle-power which the company maintains at its works?

A. And I replied there was no relation shown by a drop of one-quarter candle in round figures at the 99th Street station in traveling the mile from the station to the city testing station.

Q. Don't you know that the gas of this company manufactured at the different stations is mingled in the mains and that the candle-power of the mingled mixture is that which reaches the consumer?

A. I have no other information than is furnished by your own figures.

Q. You say you have read the testimony. Didn't you read that in the testimony?

A. Your statement is specific and clear there as to its being 99th Street station.

Q. Is that the best answer you can give to the question?

A. It is.

Q. You have referred to the Massachusetts cities in your re-direct, including, among others, Worcester, and have figured at one dollar and fifty-four cents per thousand as some value. Now, as a matter of fact, won't you take your 1905 report of the Massachusetts Gas Commission and see whether I read the values and assets set forth therein correctly for the Worcester Company?

A. Referring to the report for 1905?

3811 Q. Yes. Real estate, $536,477.

A. And thirty-four cents.

Q. Machinery $626,399.

A. And fifty-one cents.

Q. Street Mains, $114,278.

A. And forty-four cents.

Q. Meters, $19,415?

A. And seventy-five cents.

Q. That makes, according to my total, $1,296,569, omitting cents, is that right?

A. $1,296,571.04.

Q. Well, you get two dollars more than I did. Now, if you will divide that by the sales as they appear in that book, which I think are 410,641,700 feet——

A. The daily capacity, 4,200,000?

Q. No, I am not on that at all. Won't you confine yourself to my question? I asked you if you would not use as a divisor the annual sales of the company, to wit, 410,641,700 feet and let me know how many dollars per thousand of sales those assets represent.

A. It appears to be $3.15.

Q. Well, $3.15 plus; yes. Now, will you tell me whether the assets of the Worcester Company which equal $3.15 per thousand of sales include services or cash working capital other working capital?

A. I presume services are in the street mains.

Q. Well, if the services are not included in the street mains no services are included at all, are they, as far as you can judge from the report to the Gas Commission?

A. Of course services are there serving gas.

Q. But they are not in that report, are they, by name at any rate?

A. They are not named in the report.

Q. Do you know whether there is anything in the $1,296,571 representing working capital in the shape of cash or otherwise?

A. In taking that quantity out I purposely excluded everything but the actual structural assets.

Q. Then the answer is no, isn't it?

A. No, I excluded all except the actual structural assets.

3812 Q. In your reference to these other Massachusetts Companies, computing the dollars per thousand for capitalization, you have also excluded cash and other working capital and working assets aside from bare land, machinery, mains and meters, have you not?

A. In the Cambridge Gas Company in addition to what you have mentioned I have also added works in process of construction.

Q. Yes, but that is works, plant.

A. In the Fall River Gas Company in addition to what you have mentioned I have added office furniture. In the Lowell Gas Works I have given only that which you have mentioned, and in the Worcester Gas Works I have given only that which you have mentioned.

Q. Do you know whether services are included in any one of those companies?

A. Intended to be in every case.

Q. Do you know whether they are included as per the Massachusetts report from which you took the figures?

A. Not specifically mentioned in any one of these companies but included as necessary; the works could not operate without them.

Q. And in each case you have excluded cash working capital and other working capital, have you not?

A. In the case of Worcester that seems to be the case. In the case of the Lowell Gas Light Company I appear to have also excluded investments. That appears to be correct in the case of the Fall River Gas Works Company too, and in the case of the Cambridge Gas Company I have excluded notes receivable.

Q. All right, I merely asked whether in each of those cases you did not exclude working capital and you did; that seems to be the answer. Now let us take this Worcester capitalization still further. I show you the Massachusetts Gas Report for 1900. Will you look at the

Worcester Company and tell me how many miles of mains
3813 there were in Worcester according to that report (page 127)?

A. Page 127, January, 1901, you have handed me.

Q. Yes, it is another page. Don't you find 93½ miles in 1900?

A. 93 and a little over one-half.

Q. And what figure is it carried on the books according to that report. Is it not $134,065.92?

A. $134,065.92.

Q. Will you look at your 1905 report and say whether the mileage in 1905 has not increased from 93½ miles to 126¼ miles (page 127)?

A. Just about 126¼.

Q. What is the valuation at which that 126¼ miles are carried on the books of the company in 1905?

A. $114,278.44.

Q. In other words, although the mains of the company have increased in mileage from 93½ to 126¼ miles, it appears the mains have been marked down so they are carried in 1905 at actually $20,000 less than they were carried at in 1900; is that not correct?

A. It appears to be about right. It is exceedingly careful bookkeeping apparently.

Q. Now, if you take the 4 and 6-inch pipe alone as shown for 1905 and average that at a cost of only fifty cents, it would equal $163,000, wouldn't it; almost fifty per cent. more than the entire mileage of mains is carried at on the books of the Worcester Company?

A. I would have to figure these out carefully. If you wish me to do so for you.

Q. Well, 4 and 6-inch mains are right there, and supposing you take the mileage and apply fifty cents to that mileage and see if that does not give you $163,000 for those mains alone?

A. If you say it is so, I will accept the figures.

Q. And if you find it is not so you will correct me?

A. Yes.

Q. Is not fifty cents an exceedingly low price for 4 and 6-inch——

A. You mean laid?

Q. Yes, according to your computations. Assume ordi-
3814 nary pavement, not the new expensive pavement.

A. Referring to 6-inch pipe of which you have spoken for streets with macadam top, it would appear that pipe laid, filled back and pavement restored, would be very closely in the neighborhood of 85 cents.

Q. How much would 4-inch pipe be?

A. 4-inch pipe under the same conditions would appear to be sixty-two or sixty-three cents.

Q. So that if you take 4 and 6-inch pipe alone in Worcester and find that reckoned at fifty cents that equalled $163,000 or nearly fifty per cent. more than the entire mileage of mains in Worcester is carried at on the books of the Worcester Company, it would indicate, would it not, a very large charging down of the value of mains in some way?

A. I would not be willing to guess from figures of physical conditions under which pipes were laid. You can if you give the physical conditions make a fairly good guess of cost of it but you cannot reverse it.

Q. Assuming any physical conditions to exist in the City of Worcester with which you are familiar and which is one of the largest cities in Massachusetts would not your answer to my question be in the affirmative, to your best understanding?

A. No. It would be absurd for me to guess at the physical conditions from the price of pipe.

Q. You would not expect to find an increase of 23 miles in pipe in the City of Worcester with a decrease of $20,000 in value of the pipe, would you?

A. You mean changed to that extent?

Q. Yes.

A. Why, I would have to investigate that carefully.

Q. You would not expect it, would you?

A. No, I would have to investigate that carefully and look into it.

3815 Q. Now, let us take the subject of meters, which is easier yet, in Worcester. Will you look at the 1900 report which I show you and see if there were not then 9,074 meters?

A. 9,074, which includes one 70-light meter.

Q. At a valuation of $15,081.18?

A. Meters, $15,081.18.

Q. Now, according to my computation that means $1.65 or about that per meter; are you willing to assume that for the purpose of your answer, or do you want to compute it?

A. $1.65, it looks right.

Q. In 1905 were there not in Worcester according to the report 13,708 meters?

A. Yes.

Q. Valued at $19,415.75?

A. $19,415.75.

Q. And that according to my computation makes only $1.42 per meter as against $1.65 per meter in 1900. Is that a result which you would expect if the assets showed in each case the exact cost of the meters?

A. Probably a good deal of depreciation which has been promptly written off in that case.

Q. Don't you know that either $1.41 or $1.65 is a ridiculous price for the value of meters taken on the average and that meters will probably average $8.00 or $9.00 if you take actual structural value?

A. If I remember all right 3, 5 and 10-light meters will hardly average indeed more than somewhere in the neighborhood of $5.00 or $6.00.

Q. Well, take this value, they would be very much more than $1.41 or $1.65, wouldn't they in a city the size of Worcester, the ordinary standard meters?

A. They probably have been writing off depreciation in this case on the basis of seven years' life, which is very frequently done. Of course, I don't know this, it is a mere surmise on my part.

Q. But you know that $1.41 or $1.65 would look as an extremely low rate at which to carry meters?

A. Regarding the question of the light, I have not the figures. It probably has resulted from their writing off the meter values,
3816 assuming the life of seven years to a meter.

Q. After they had written off their meters for awhile they would get down to an average life where there would be no further writing off but the meters would maintain an average, and don't you see that 40 per cent. of all these meters are only five years old because there were only 9,000 in 1900 and 13,700 and more in 1905?

A. It seems to me a very conservative estimate indeed, of the value of the meters.

Q. Let us be perfectly fair and frank about this. Does not that valuation impress you as a valuation substantially below the actual value of the meters as they would exist naturally in a city like Worcester, assuming that 40 per cent. of them have been added new since 1900?

A. If we could get the average life of those meters——

Q. I don't care to have you figure on the average life. If you cannot answer my question I am not going to press it.

The Master: He already answered it substantially, as I understand it. He said it would strike him as a very conservative figure for them.

Mr. Mathewson: I think he should have said it was a very ridiculous figure for them.

Mr. Burr: Are you testifying again?

Mr. Mathewson: No. I am stating what I think he should have testified to.

Q. Now, let us take your little book. You at pages 218 and 219 prepared a table covering the gas companies in Massachusetts, did you not?

A. Not in its entirety.

Q. Well, it appears in that book and is adopted by you, isn't it?

Mr. Burr: As what?

3817 A. Gas companies which did not meter their gas or which had a large contract of sales, lump sum, were in whole or in part omitted from this.

Q. Well, very good. Let us take it——

A. And also companies in many cases——

Q. Well, we will take it as it stands; that is included under the column headed, "Investment per thousand feet?"

A. I would have to look that up to see whether that is the capitalization or assets per annual one thousand feet of sales.

Q. Well, at any rate the figures are taken from the Massachusetts report of 1901, are they not?

A. Yes.

Q. Now, here I find opposite these cities in Massachusetts, the heading, "Investment per Annual One thousand feet," the following:

Fall River	$3.97
Springfield	4.36
Charlestown	4.31
Cambridge	3.85
Lawrence	5.50
Haverhill	3.85
Lowell	2.77
Dorchester	4.45
Lynn	3.06
Worcester	2.89

Is that correct? Have I read it correctly?

A. That is per annual thousand sales?

Q. Now in another column, referring to your testimony heretofore that you allowed 10 per cent. dividends and 5 per cent. for depreciation, I find this, this being the heading of the column: "Fifteen per cent. depreciation and profit per one thousand" and under that column I find the lowest figure which you allowed
3818 to be 33 cents which is in the case of Fitchburg or Newburyport, if I am correct; and then next in order from the lower up I find:

39 cents for North Adams
41 " " Lowell
42 " " Worcester
46 " " Lynn
55 " " Woburn
58 " " Haverhill
58 " " Cambridge
59 " " Fall River

and so on, up to higher figures. Have I read the figures correctly?

A. I presume you have. I am willing to accept them.

Mr. MATHEWSON: Have I, Mr. Burr?

Mr. BURR: I think so.

Q. And these cents per thousand relating to these separate companies which you have included under the heading "15 cents depreciation and profit one thousand" are carried into the total of the next column which is headed "Total charge—proper selling price per one thousand feet." Is that correct?

A. That is correctly related.

Q. And the very lowest selling price or "Proper selling price," to use your language, per one thousand feet, is that marked for the City of Worcester, $1.07, is that right?

A. I accept your reading, Mr. Mathewson. Always.

Q. Referring for a moment to your remarks on real estate you state that in a great city where there was a high cost that was compensated by the subsequent increase in value?

A. Increase in output, in sales.

Q. But how does that compensate you as to the value of
3819 your land if you cannot use your land until you move your plant off?

A. I was speaking of the original cost, purchase price.

Q. If you do move your plant off from a piece of real estate in order to sell it at the present value and get that advantage who bears the expense of the replacement of the plant on some other plot?

A. I presume you would not move unless it was a pretty good move.

Q. Well, but we would have to if we received any advantage from increase in value of our real estate so we were able to realize on it.

A. It is altogether a voluntary matter with you, to be determined according to the best profit you can make by either staying or going.

Q. And in the best profit we can make by staying, that would mean simply a return on original cost of the land although it might now be worth three times the original cost?

A. Yes.

Mr. Burr: You do not claim you are speculating in real estate, do you, in addition to manufacturing gas?

Mr. Mathewson: I have not made any such claim, but we accept the gifts the Gods provide, as they provide them, without protest.

Mr. Burr: At the expense of the consumer?

Mr. Mathewson: No, because nothing comes out of the consumer in increasing the value of our land. It is due to Divine Providence and the growth of the City of New York.

Q. You have spoken about the output in Massachusetts being about equal to the output in New York?

A. No, somewhat less, considerably so, perhaps.

Q. Do you mean to say that the value of the land in Massachusetts to produce that amount of gas ought to be as great as 3820 the value of the corresponding land on the Island of Manhattan required to produce the same amount of gas, or that there is any comparison at all between values of land in Massachusetts and on Manhattan Island?

A. I stated that the value of the land used on the Island of Manhattan for gas purposes must be greater than the value of all the land used by all the gas works in the whole State of Massachusetts, in order that the cost per thousand cubic feet of sales should be greater in New York than it is in the whole State of Massachusetts.

Q. You have not any doubt that the value of the land is greater in the Island of Manhattan than it is in Massachusetts, have you, for the production of a similar amount of gas?

A. I referred, not to the question of gas, but to all the land, every foot of land, owned by all the gas works in the whole State of Massachusetts.

Q. That is what I mean——

A. Which produces a less quantity of gas and sells it than does the land now used for gas making on the Island of Manhattan.

Q. You did not mean to suggest, did you, that the value of the land in Massachusetts spread over the State producing that amount of gas was equal to the value of land in the Island of Manhattan producing a similar amount of gas?

A. The ten billion?

Q. Yes, did you mean to suggest that the value of land in Massachusetts taken all together was as great as the value of land in the Island of Manhattan producing a similar quantity of gas?

A. Used for making gas?

Q. Yes.

A. I offered it as a simile giving a general idea of what I had before stated that, as the gas sales went up it was compensated by an increase in the cost of land generally, and that as they went
3821 down as they do in Massachusetts in many small towns, that that was to say, compensated by a cheapening of the price of land and finding fortuitously that Massachusetts claimed to make 10,400,000,000 feet, as I thought incorrectly, and it coincided with New York, I tried to make it clear by that general statement.

Q. I do not understand how we are compensated by the increase in the value of our land if we cannot sell the land but have to use it for gas manufacturing at exactly the same value which it cost us originally. How is there any compensation if we cannot treat the land as of the present value? You cannot make any more gas per square foot, can you?

A. Well, land costing the $3,000,000, as I look at it, on the Island of Manhattan, and turning out ten and one-half billion cubic feet of gas, and having done that for many years, is doing mighty well.

Q. But where do we get the advantage of any increase in price if we are obliged to compute that land always at the original cost to us in using it in the gas business? I am trying to get you to explain where your theory of compensation comes in if your other theory that we cannot consider the value of the land at its present value is to be accepted?

A. My idea is that you should not get the result of the increase in value.

Q. I understand. If that be so, then where is there any compensation because theoretically the land is increased in value, if practically we are unable to receive any greater return on it than we were when the land was originally bought and was only one-third the present value?

A. The extraordinary increase of value of land in New York City is simply a piece of good luck for which no deserving return has been made, and the community makes the value of the very profitable gas works in New York and ought not to be assessed extra on account of that.

3822 Q. Is that the best answer that you can make?

A. I have made other answers. I am trying——

Q. Is that the best answer you can make as to my inquiry as to where the compensation comes in?

A. It don't come in.

Q. Then there is not any compensation by reason of the increase in the value of the land, is there?

Mr. Burr: You get compensation when you sell it.

The Witness: That has already been stated.

Q. By Mr. Burr?

A. I beg pardon, by myself.

Q. Then I ask you if when we do get this compensation which is such a great thing for us by removing our plant to some other place, how the expense of the construction of this new plant is to be met, is it to be met by increasing the cost of gas, that is charging the replacement to the consumers?

A. Mr. Mathewson——

Q. And if not, where does the compensation come in, because while we have got some increase in the value of our land we have lost completely the value of the plant which we have abandoned, because as scrap, the testimony is unanimous that it is worth nothing or practically nothing. Now, can you elaborate a little more your theory of compensation, because we are anxious to find where it is and we are looking for it?

A. In all these matters, as in all business matters, you have to use your judgment doing the best you can, the decision as to whether you move or do not move is simply a question for you to decide.

Q. Is that the best answer you can make?

3823 A. The situation with regard to the Consolidated Gas Company is an exceedingly fortunate one as compared with a good many other companies I know of, and I don't think that the company need worry over the question of moving, if, in figuring it out, it would not appear quite as profitable as staying where they are.

Q. Is that the best answer you can make to my question?

A. Indeed it is.

Q. Then I do not see that we have got much light on compensation, but we will go to another point. You have said that in England, according to the English accountants taxes or certain items went into profit and loss or should go into profit and loss and you thought therefore they should not go into the operating cost of gas. Don't you know that by the English law taxes are referred directly to profit and loss and that they also appear in the cost of gas?

A. I know that rates and taxes appear in profit and loss.

Q. And you also know that they appear in the cost of gas, don't you?

(No reply).

Q. Now, you have used the term "profit and loss" as a dumping ground for items which you take out of cost of gas, because you say they ought to go into profit and loss. Now, is it not a matter of fact that profit and loss is an account into which other accounts are charged at the end of the year and that the best practice is to charge nothing into profit and loss directly where it is possible to avoid it without first charging it into some other account, some other operating account, is not that true?

A. Profit and loss, you know, is a final account.

Q. Exactly. It is a final account. Now, is not that the best practice, to carry expenditures to some other account which is closed into profit and loss at the end of the year instead of transferring the items directly to profit and loss?

A. If you will mention any particular account that you are handling——

3824 Q. No, I am speaking generally——

A. I cannot give general instructions in bookkeeping.

Q. Is it not the best practice in bookkeeping to charge general expense into operating accounts in the first instance instead of charging them over directly to profit and loss where it can be charged into some current account?

A. As I said to you before, profit and loss is regarded as a final account, you know, and it does not follow—you can generalize in the way you are——

Q. Everything has to go into profit and loss account ultimately, doesn't it?

A. Yes.

Q. Whether carried directly to profit and loss account or whether first carried into an operating account. That is true, is it not?

A. Well, you know, of course, there are certain capital expenditures which do not go into that account.

Q. I am talking about expenditures of the business, and not return upon capital and payment of dividends. That is true, is it not?

A. I am speaking now of what might be called active accounts.

Q. Exactly. So it does not at all follow, because you think an item should be charged into profit and loss account ultimately, that it may not also appear in the operating cost of gas, does it?

A. Well, that is altogether a question of common consent amongst those adjudged proper to decide on those questions.

Q. Well, I am asking your view on that subject. You have used the term "profit and loss."

A. I have specifically stated in every case the particular account that I thought *out* to go to profit and loss. I have not attempted to generalize in regard to bookkeeping and cannot answer you in that way, because I cannot——

Q. You have taken various general items and said you did not charge them into operating account, but charged them into profit and loss.

3825 & 3826 A. I did and I have named every item and I know too much about bookkeeping——

Q. Now, I ask you, if the fact that they are to be charged into profit and loss of itself is any reason why they should be excluded from an operating account in determining the cost of gas?

A. I know too much about bookkeeping to make a general reply to that question. Every account will have to be considered specifically and I will answer specifically if you wish.

Q. If you cannot answer the question I asked you generally, I shall accept what you have said, Professor. Is that the best answer you can give?

A. That is the best answer I can give.

Mr. Mathewson: I have only two more questions but I shall ask the Master to suspend, as I have to catch the 5.05 p. m. train.

Adjourned to 10.30 a. m. Friday, November 2, 1906.

3827 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIEN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *November* 2, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

3828 WILLIAM D. MARKS resumed.

Continuation of the cross-examination by Mr. MATHEWSON:

Q. Do I understand that in connection with the building of the Laclede Gas Works about 30 years ago you were employed by and represented William Farmer, the Chief Engineer?

Mr. BURR: I object to that as not being proper recross-examination. His qualifications and everything in regard to that were gone into on cross-examination, and there was nothing said on redirect that would justify an examination now by way of recross-examination in regard to his qualifications and past experience.

Mr. MATHEWSON: It is not recross-examination, but I desire to ask him one or two questions, not over three, relating to his position in the Leclede Gas Company.

Mr. BURR: You see, that makes it necessary for me to examine him on the re-redirect.

The MASTER: I will allow it.

Mr. BURR: Exception.

A. I would like to clear that point up beyond any possible misunderstanding. I was paid by the contractors for the building of the works. Mr. William Farmer was also paid by the contractors for the building of the works. William Farmer did not visit St. Louis, except I think on two occasions during the construction of the works. For that reason I was designated by the contractors to take all the work that came, delivered to them by Mr. Farmer, with Mr. Farmer's approval as I understood.

Q. Mr. Farmer was the Chief Engineer, was he?

A. Mr. Farmer was the Chief Engineer.

3829 Q. Well, was not Mr. Scobelski the Chief Resident Engineer in charge?

A. Jake Zabriskie, do you mean?

Q. Well it is spelled both ways in the literature, I find.

A. Jake Zabriskie was the man——

Q. Was he not the Chief Resident Engineer under Mr. Farmer?

A. Certainly not. He did not even suspect the true meaning of engineering, let alone knowing anything about it.

Q. And you were the resident engineer, were you?

A. I was the man designated to carry out Mr. Farmer's work, criticising, examining and inspecting, and in so far as I had any official title, was both accountant for the contractors and resident engineer for the contractors.

Mr. **Mathewson**: I have no more questions.

By Mr. **Burr**:

Q. Now, Doctor, yesterday you were referred to a tabulation of Massachusetts Gas Companies from the report of 1901 of the Massachusetts Gas and Electricity Commissioners as they appeared on pages 218 and 219 of your book, "The Finances of Gas and Electric Light and Power Enterprises." Will you state what was the original object of these tables as they appeared in your book?

A. The object of Chapter 6 of *by* book, prices of gas in Massachusetts——

Q. You are now referring to the schedules to which your especial attention was called yesterday?

A. Yes, was a review of the then existing conditions of the large number of small companies, and the deduction of a general law, connecting sales per capita with the price of gas, per thousand cubic feet in Massachusetts. Many of these companies were quite small, and for that reason amongst others, their fixed expenses invested per
annual thousand cubic feet of gas sold, their cost of manu-
3830 facture and distribution per thousand cubic feet of gas sold,
and the proper selling price of gas were all large. In that table no attempt was made to prescribe the proper method or cost of construction or prices which should be charged if the works were properly designed and properly operated, or properly arranged as to their capacities. All of the data stated in that table is but a relation of the actual facts as deduced from the report of the Massachusetts Gas and Electricity Commissioners. No attempt was made to criticise, examine or develop the possibilities of these various companies. They were accepted without criticism, and the proper selling price per thousand cubic feet was deduced to show what would have to be charged to produce 15 per cent. to cover depreciation, profit, and all of the contingencies existing as they stood.

An entirely different treatment is required to use what few of them are of sufficient size to be available in comparison with metropolitan companies. None of the figures given show the possibilities of these companies, they show only their actual condition, and for this reason the figures in the tables on pages 218 and 219 are of no value whatever for the purposes of the investigation of the Consolidated Gas Company of New York.

Q. Will you state in a general way what has been your method of investigation of the Consolidated Gas Company of New York?

A. The gas works operated by the Consolidated Gas Company on the Island of Manhattan are operated under conditions which do not exist anywhere else in the world. First of all, these gas works are driven to their utmost capacity, and therefore the investment per annual thousand feet of sales is as small as can possibly be hoped for in gas works. In but one item are these works as a matter of 3831 structural cost more costly than any other average gas works per thousand cubic feet of sales, that is the real estate. It happens, owing to the early purchases, and at low prices, and subsequent sales at high prices, of a portion of the land, that the structural cost of the land appears to be in the neighborhood of three million dollars.

Mr. **Mathewson**: That is not redirect examination. You have already gone into that three million dollars in direct examination at length.

Q. That the structural cost of the land remaining appears to be about three million dollars?

A. Yes. The structural cost of all the other details, brick buildings, manufacturing apparatus, gas holders, mains, services and meters, can only exceed, because of locality, by a small percentage, the structural cost of these details in any metropolis. On the other hand, because of their very large size, the cost of these works is probably very much lower in cost per thousand cubic feet of capacity than the average of the small and medium sized gas works. The conditions all point to a minimum of cost of construction and a maximum of profit per thousand cubic feet of sales. The responsibility of dealing with such large affairs as are involved in the consideration of the Consolidated Gas Company's price for gas has rendered necessary most exhaustive investigation and immense labor in details.

First, it was necessary to learn the probable result of reducing the price of gas from $1 to 80 cents per thousand cubic feet as shown on the chart of Manhattan already in evidence. It appears probable that if the price of 80 cents for gas goes into effect during the year 1907, that the total sales of gas by the Consolidated Gas Company during that year will amount to about 15,300,000,000 cubic feet, earning in gross about $12,240,000 from gas sales.

3832 The **Master**: Pardon me. Is there very much of this?

The **Witness**: No, very little.

The **Master**: It does not seem to me to be reredirect.

The **Master**: It is explaining in a general way the methods he pursued.

The **Master**: It covers the whole ground of his position in the case, and if Mr. Mathewson chooses to cross-examine on it it opens up a vista of another day's examination which would seem to be unnecessary.

The **Witness**: Second, it was necessary to investigate the actual cash cost of gas for material, labor, repairs, general supervision and operation under the conditions existing in the year 1905. From the statistics presented, the estimated cash cost of gas appears to have been in the neighborhood of 53.5 cents, although this is stated to be doubtful from the data furnished. It cannot be predicated from this investigation that economical and scientific management will not further largely reduce the cost of producing and distributing 22 candle power gas at the meter.

The price of oil, when compared with the prices obtained by other and smaller companies appears to be about one cent too high per gallon——

Mr. Mathewson: Has not that already been said and gone over?

The Witness: I never before said anything about the oil.

Mr. Mathewson: Yes, you compared the rate of oil here and took the cities in this State and compared them with the rate we paid.

3833 Mr. Burr: He never stated what, in his opinion, was the amount that it was in excess of the rate that should be charged.

Mr. Mathewson: I do not think he is competent to state that at all. He has never bought and sold oil in this vicinity.

The Witness: And the illuminating power of the gas produced, largely in excess, say about four candles, above the average legally required. The investigation of the methods of management, so far as gone into, would appear, in the matter of material, to admit of heavy losses, due to lack of close supervision and system in the handling of material used.

The existing facts as to the cost of gas will be learned, so far as the year 1905 is concerned, from the investigation of vouchers, pay rolls and account books, now in progress.

Third. In order to determine the true structural cost of the gas works of the Consolidated Gas Company, it was necessary to make careful inventories of the existing plant, and to obtain for this purpose the services of reliable and impartial gas engineers and constructors. This inventory has been made for the Consolidated Gas Company by one of its employees, an engineer, but appears to me to be too high on account of an unwise neglect of depreciation. Another inventory is being made by engineers employed by the State.

In order to corroborate, or rather to anticipate the results of this inventory, I have taken the statistics of four Massachusetts gas companies, Cambridge, Fall River, Lowell and Worcester, which appear to have had a normal growth, and not to have had their accounts sophisticated by tricky financial methods, and from the capacity of these works and their cost as reported to the Mas-
3834 sachusetts Gas & Electricity Commission I have deduced an average cost per thousand cubic feet of capacity of about 1.75 cents, and, using this average with additions, I have obtained a total cost of the plant of the Consolidated Gas Company, together with a necessary working capital, which it does not appear can by any possibility exceed the twenty-nine million or thirty million dollars fixed as the cost of all the plant, from real estate to meters, with working

capital by the New York Gas & Electric Commission, at the same time that the price of gas was fixed at 80 cents per thousand cubic feet to private consumers.

Mr. Mathewson: I move to strike out the entire answer on the ground it is not redirect-examination, but is simply a summation and statement of conclusions which should not now be presented, and which is not properly in the case in that shape.

Mr. Burr: I think it is entirely proper in view of the cross-examination, which was for the purpose of discrediting the conclusions which he thought should be drawn. He is entitled to show the means he adopted in arriving at his conclusions.

The Master: He is entitled to tell it in response to question and answer in the ordinary way. There is no warrant that I know of for a witness making a stump speech to justify his testimony.

Mr. Burr: I object to the designation of this statement as a stump speech.

The Master: Well, it is perhaps a little extreme——

Mr. Burr: All these experts, Dr. Humphreys and the others, have made their statements from carefully elaborated data, and it has been impossible by question and answer to extract the information
3835 in regard to the various details in those examinations.

The Master: I know, sometimes that habit of preparing long written answers prevails among experts in patent cases, but it is a very reprehensible practice.

Mr. Mathewson: Is there any justification for the witness going into the question of sophistry and sophistication by tricky financial methods? I say it is utterly improper, and it is not worthy of the witness to employ such language. It is outrageous. It is not testimony, it is simply villification.

Mr. Burr: It is not worthy of any one to employ such methods if they have been used.

Mr. Mathewson: No, sir; no one can put a finger on such a method. They have not been used. That is an outrageous statement.

Mr. Burr: I except to the striking out of the testimony.

Q. I call your attention to Field's Analysis, Doctor Marks. Your attention was called by Mr. Mathewson yesterday to the use of the candle power as required and as actually supplied in London. Do you desire to make any explanation in that regard?

A. The candle power furnished being an average of 16½ candles by the London Gas Light & Coke Company, designated as the Gaslight Company, page 16, was made by the mixed method; that is, the use of common coal gas distilled in retorts enriched by the use of oil and spirit in large quantities. It appears for the year 1905, page 16, that the Gaslight Company in that year used 15,935,240 English gallons of oil and 220,973 English gallons of spirit. In this respect the London Gaslight & Coke Company differs largely from the Commercial and the South Metropolitan, for while it uses common coal, as also does the other companies, it also in addition
3836 uses large quantities of oil and of spirit as enrichers. For

this reason it does not present any difficulty in retaining or holding very closely to the candle power described, which is 16.

Q. You heard the testimony of Chief Engineer Bradley, that it would take from fifteen to twenty-five years to complete the projected Astoria works?

A. I recall it.

Q. If the figures given in the Burr-Herring-Freeman report should be accepted as true, there would be no reason in your opinion, or no justification, in your opinion, for completing the Astoria works, would there?

A. Not if the gas from the Astoria works was to be used in the Island of Manhattan.

Mr. BURR: That is all.

By Mr. MATHEWSON:

Q. What did you understand would be completed in from fifteen to twenty-five years at Astoria?

A. The works at Astoria.

Q. What works, what capacity?

A. The gas works.

Q. What capacity, the first unit or second unit?

Mr. BURR: All the works, I understand.

Mr. MATHEWSON: Won't you let him testify? It is not what you understand; I am trying to find out what the witness understands.

The WITNESS: It was to be 240,000,000 daily capacity ultimately, if I remember right.

Q. And that is what you had in mind, twelve units of twenty million capacity each, which would be completed in fifteen to twenty-five years if the entire project was put through, wasn't it?

A. I understood Mr. Bradley to say so.

3837 Q. Well, that did not refer to the completion of the first unit or the second unit, did it?

A. I understood that that was to be completed much earlier from testimony.

Q. Now, you spoke of the London Gaslight & Coke Company, where the candle power runs 16.48 as against a required candle power of 16. You understand that the 16.48 is an average, don't you?

A. 16.50 for two years.

Q. Well, call it 16.50, 16½ about; you understand that is an average, don't you?

A. Yes.

Q. Do you know how often the tests showed below 16?

A. I do not.

Q. Don't you know that a great deal of the gas of the London Gaslight & Coke Company is made fourteen miles from the city, and is sent into the city from that distance, and that these tests are made in the city testing station, near the point of consumption, after the gas has traversed that mileage of mains, or don't you know that?

A. I do; that there is a very large gas main laid carrying gas a very great distance, in a general way. I cannot recall the figures.

Q. Do you know under what pressure that main works?

A. I do not.

Q. Don't you know that it works under a pressure of 60 inches?

A. That depends upon which end you are considering.

Q. Well, we will consider the starting end.

A. No, I knew it was necessarily at a high pressure at one end.

Q. Do you know whether any oil is used in enriching the coal gas of the London Gaslight & Coke Company at all or, whether that oil is used in the manufacture of water gas wholly?

A. I do not. I know just what they state.

Q. I am not going to examine you one the answer that was stricken
out, Professor, because it was stricken out, but I am going to
3838 ask you about this neglect of this depreciation which you say
you found in the testimony of Mr. Mayer. Did you find that
he deducted depreciation right along for various pieces of apparatus
and buildings used in arriving at his figures?

A. My objection——

Q. Just a minute—answer that question.

A. Yes.

Q. Did you not find in some cases he deducted as much as 50 per cent.?

A. I recall that in one case where he said the roof had fallen in and he had deducted 50 per cent.

Q. Did you not read his testimony or hear it where he said that wherever he saw any deterioration he deducted depreciation?

A. I remember he stated that he did deduct depreciation because of what was visible to him.

Q. Don't you remember in some cases he had deducted depreciation where he said the apparatus appeared to be as good as new, but that he deducted it because he found that it had been acquired a considerable time before?

A. That was very rare, if at all.

Q. You don't remember any such instance in his testimony, do you?

A. Very rarely if at all.

Q. Do you remember any such instances in his testimony?

A. I am not sufficiently clear on that point to make any further reply.

Q. Now, in reference to the manufacturing of great amounts of gas by this company, did you read the testimony of Professor Bemis and the other witnesses that after an output of about 700,000,000 feet per annum is reached there is no substantial economy in the production of further amounts per thousand cubic feet?

Mr. Burr: Professor Bemis qualified that statement and explained it.

3839 Mr. Mathewson: No, he said he still believed it.

Mr. Burr: You had better refer to his special testimony on that point if you want to ask this witness.

Q. Have you read that testimony?

A. I once before answered that I had a general impression of that sort, but had not seen it. I should have to see it.

Q. Don't you agree with Professor Bemis and the other witnesses in that respect?

A. I do not concur with any engineer or individual who proceeds to generalize in the air on the subject of any plant.

Q. Is it your view that there is a substantial economy in production per thousand feet by reason of increase after a company does have an output of say 700,000,000 feet per annum.

A. I cannot make any better reply than I did to you before.

Q. Very good. Now, I am going to take your table on page 218 and page 219 of your book and refer to the companies you just mentioned as having compared with the Consolidated Gas Company.

Mr. Burr: Is that the same table you referred to yesterday?

Mr. Mathewson: Precisely.

Mr. Burr: I object to it because you have already had your opportunity to go fully into that and we have answered you this morning. Now, if you are going into it again, of course, I shall have to have the opportunity of examining him still further.

Mr. Mathewson: All right. The witness a few moments ago in his testimony in reply to Mr. Burr said that this table on pages 218 and 219 was intended as an average of smaller companies and that
there were few large companies. He then mentioned that
3840 the companies he compared to the Consolidated were the
Fall River, Cambridge, Worcester and Lowell. And I now
propose to read from these pages the data regarding those four companies and ask if I read correctly.

Mr. Burr: That was all gone into yesterday when examining from this table, and this was a reply to their examination yesterday. Now, if they go still further into these tables I must have the opportunity to reply. I thought they had exhausted these tables and that was the reason I asked the doctor to make an explanation as to what those tables represent.

Mr. Mathewson: I am going to select the four which he said he had himself compared.

Mr. Burr: Those are the four you referred to yesterday?

The Master: If you examined on these redirect, Mr. Burr, and Mr. Mathewson wants to cross-examine on them, I think he is entitled to. I don't know exactly what the point is, yet.

Mr. Mathewson: My question will be very brief.

Q. I will ask you, taking the four cities to which you have referred this morning as having compared to the Consolidated, whether your tables do not show the following:

"*Investment Per Annual Thousand Feet of Sales.*

Fall River	$3.97
Cambridge	3.85
Lowell	2.77
Worcester	2.89."

and if you do not state for those under "Total Charges, Proper Selling Price per Thousand Feet,

3841

Fall River	$1.30
Cambridge	1.25
Lowell	1.15
Worcester	1.07"

Is that correct?

A. I have not caught all of them. It appears to be, though.

Mr. Mathewson: That is all the questions I have to ask.

By Mr. Burr:

Q. Have you pursued your studies as to the estimated population and the estimated consumption of gas in 1907, in the Borough of Manhattan?

A. Not only in the Borough of Manhattan, but also in all the boroughs of the City of New York, in order to avoid any possible incorrect theory of superficial reasoning; I have worked them out very thoroughly.

Q. Is that the chart upon which your results are set forth?

A. Yes, a chart showing the Borough of Manhattan, the Borough of Bronx, the Borough of Brooklyn, the Borough of Queens, the Borough of Richmond, and the composite line of Greater New York, together with a population of Greater New York of about 4,244,413, estimated, in 1907.

By Mr. Mathewson:

Q. Is that chart worked out on the basis of your previous testimony?

A. Yes.

Mr. Burr: I offer it in evidence.

The Witness: It was worked out in the rough before my testimony was given.

Mr. Mathewson: I make the same objection to that that I did to the original testimony; that the Professor is not a competent witness on that subject; it is merely speculation.

3842 The Master: There is no new matter in this that is not covered by your prior testimony?

Mr. Burr: It shows the results of the study of the whole of Greater New York and confirms the statement as he presented it with regard to the Borough of Manhattan.

Mr. Mathewson: I understand it is merely a graphic representation of his previous testimony and nothing further.

Mr. Burr: That is all. It does not change anything in the previous chart at all, Mr. Mathewson.

Objection overruled. Exception.

Received in evidence and marked City's Exhibit 62.

By Mr. Mathewson:

Q. There is one other thing I want to read from this table which I overlooked for a minute. From page 219 of your book, Professor, I quote in reference to the four cities as follows, and ask if I am incorrect:

"Fifteen Per Cent. Depreciation and Profit Per One Thousand Feet.

Q. "Worcester, 43 cents"?
A. Yes.
Q. "Lowell, 41 cents"?
A. Yes.
Q. "Cambridge, 58 cents"?
A. Isn't Cambridge 39 cents?
Q. No, that is North Adams. "Fall River, 59 cents"?
A. All right.
Q. If there is any mistake about it you can correct it. Does that appear to be correct?
A. Yes, as stated in this table, based on thousands of annual cubic feet of sales.

3843 By Mr. BURR:

Q. As you have previously stated?
A. As I have previously stated.

WILLIAM HALLOCK, a witness called on behalf of the State, being first duly sworn, testified as follows:

Direct examination by Mr. KIRBY:

Q. Are you a graduate of any university or technical school?
A. I am a graduate of Columbia University, with the degree of Bachelor of Arts, and the University of Wurzburg, with the degree of Doctor of Philosophy.
Q. Do you occupy any Chair upon the faculty of Columbia University?
A. I am Professor of Physics, Columbia University, and present Dean of the Faculty of Pure Sciences.
Q. As such and during your studies, have you given any special attention to matters having to do with photometers, electric measurements, electrolysis and kindred subjects?
A. As professor of physics I have had my attention devoted to such subjects for upwards of fourteen years.
Q. Have you during the past two years made any special studies in reference to candle power of gas which is furnished in the Borough of Manhattan, the illuminating efficiency of the flame and kindred matters?
A. I have.
Q. You appeared as a witness in behalf of the State before the Stevens Investigating Committee on this subject of candle power, did you not?
A. I did.
Q. Are you a member of any scientific societies or associations?
3844 A. I am a member of the American Physical Society, Fellow of the American Association for the Advancement of Science, and the New York Academy of Sciences.

Q. I call your attention to the testimony of Alexander C. Humphreys, given at this hearing, pages 1938 and 1939 thereof, where, in answer to certain questions having to do with Mr. Humphreys' qualifications, as to his being qualified to testify upon the subject of electrolysis, the Master states: "If a little electricity is bad, a great deal more will be worse, will it not?" Also, to the testimony of President Humphreys appearing on pages 2160 and 2161, where he states:

"Q. I was not talking about taking care of your mains out of this five cents until you said you were? A. No, sir, you spoke of electrolysis and asked if I had included that in the depreciation for the mains and I distinctly said I had not.

"Q. Yes, I think that is correct. Then, to this speculative field of electrolysis about which we know nothing, whether it will depreciate or not? A. I don't know whether you know about it or not, sir, but I do know. I know it is a very serious hazard in the business, and very serious. Wherever there are any stray currents we expect electrolysis more or less and there are stray currents in the City of New York."

Mr. Mathewson: Whose testimony is that?

Mr. Kirby: Dr. Humphreys'.

Q. Now, I take it, professor, except in a general way, you are not familiar with the conditions of the pipes and mains and electric elements in the streets in the City of New York or the Borough of Manhattan?

A. No; except in a very general way.

3845 Q. But you are, are you not, familiar with the physical law as electrolysis applies not only to electrical current, but to the chemical-physical action known as electrolysis which the same may set up under proper conditions? You are so familiar, are you not?

A. I am.

Q. If a current is passing through a pipe or other conductor will or will not such current produce a harmful effect upon that conductor?

A. It will not produce any harmful effects unless the strength of the current is sufficient to heat the conductor.

Q. And that would not be an electrolytic effect, would it?

A. No.

Q. Under any circumstances will a current flowing to a conductor of any kind produce any harmful electrolytic effect?

A. No.

Q. Under what circumstances and conditions can there be such an effect as electrolysis?

A. Electrolysis takes place when a current of electricity passes from one element through a material, which is usually a solution, technically known as electrolyte, and leaves this solution to enter upon another conductor. Under these circumstances the passage of the current through the solution or the semi-solution produces the physical-chemical reaction known as electrolysis.

Q. In other words we must have first of all an electric current; next we must have a conductor carrying that current; next a solution which is a conductor of electricity, and next some other conductor to which the current will pass if the current is able to pass through this solution; and then, in addition to that, am I right, that you must have a sufficient voltage or what is commonly called pressure to decompose this solution before any other electrolytic action can be set up? Is that a correct statement of the conditions?

A. That is a correct statement.

3846 Q. Now, if it be that a gas main is the conductor to which the current flows what would be the effect if there were stray currents and electrolyte and therefore what is known as electrolysis?

A. If the current is flowing to the gas pipe the electrolysis would produce no injurious effects upon the pipe.

Q. If there would be any effect it would be that of depositing upon the pipe such substances as might be carried over through the electrolyte? Am I right in that?

A. Yes.

Q. This, therefore, would be a deposit upon the gas main rather than taking away any substance from it?

A. Yes.

Q. And after the current reached the gas main, in its flow through it, unless the current should be so great as to produce a heating effect sufficient there to melt the pipe or the lead caulking thereof, there would be no harmful results produced, in your opinion?

A. No.

Q. Now, I take it that it is a general law, a general law of the flow of electric current, as well as of most other forms of energy, that it always seeks the path of least resistance; am I right in that?

A. Correct.

Q. So that if we had a street in which were placed gas mains, water mains, and various cables covered with lead sheathing, such cables as are in general use for telephone and telegraph wires, we would find a condition, would we not, in which the tendency would be for the current to follow the continuous path such as is afforded it by the continuous lead sheathing of these cables rather than to follow a gas main or a water main where the path is broken by the pipes being of sections joined or caulked together?

A. The tendency would be to follow the continuous metallic path in preference to broken paths.

3847 Q. The passage of current through a semi-fluid or material, or say moist earth, which through drainage or otherwise had become somewhat permeated with salts, would, I take it, have the effect of decomposing the moisture in such earth and leaving the earth itself in a dry condition; am I right in that conclusion?

A. That would be the general tendency. It would depend somewhat upon the dissolved salts.

Q. What other effect, if any, might take place?

A. The salts would be accordingly removed from the solution by electrolysis, and then if it were carried on still further the water would undoubtedly be removed also.

Q. And that taking place, what would be interposed to the path of the current from one metallic conductor to the other where formerly the damp, moist earth was and in which the electrolytic action would be set up?

A. The action would be to increase the resistence offered by the moist earth.

Q. Increasing the resistance would mean that the amount of current which would flow would be increased in the same proportion?

A. Decreased in the same proportion.

Q. Decreased, I mean, in the same proportion?

A. Yes.

Q. If we had a current flowing upon a gas main or other conductor and another current, or no current, flowing upon an adjacent conductor and there were damp earth or a liquid between such conductors so permeated with salts as to make the same a proper electrolyte, would it necessarily follow or would it follow at all that there would be any electrolytic action or current flowing between the two?

A. That would depend upon the salts involved in the solution and the strength of the current in the pipe carrying the current and the relation of the strength of current to the resistance which the pipe offered to the current.

3848 Q. And, in other words, it would depend very largely upon the voltage which would be necessary to start electrolytic action and to overcome such resistance which might be in the electrolyte?

A. Yes, it would depend upon the existence of a sufficient pressure between the pipe carrying the current and the pipe carrying no current to overcome the counter-pressure of the electrolyte.

Q. I ask you if you have read the Act in relation to illuminating gas in the City of New York, etc., being Chapter 125 of the Laws of 1906, and especially Section 2 thereof, having to do with the candle power of the gas which is to be furnished and the pressure under which it is to be furnished?

A. I have.

Q. I call your attention to the testimony of President Humphreys, given at pages 2096, 2097, 2098, 2099, all of which is in reference to the candle power of the gas and the flame and the proper pressures and especially in reference to the question at the bottom of page 2099, as follows:

"Q. We will disregard the Bray burners, and the check burners and the anti-swirl burners, and come down to the burner used by the plain people, and which under 7/10ths of an inch, 22 candle power, will produce the best results. Now, if you take that burner and increase your pressure by an inch, what would be the result on the illuminating quality of the gas? A. Let me say, first of all, that we cannot disregard the swirl burners and all those things and come back to the burners used by the ordinary people, because I am talking about the burners used by the ordinary people. As I have said repeatedly, and I am not trying to quibble about any extraordinary burner, if you have seven-tenths pressure on a burner and increase it an inch the effect would be to reduce the candle-power probably, and the amount could not possibly be told until you took that particular burner and the particular gas to determine it by experiment." 3849

And also more especially to the question and answer at the bottom of page 2179 and the top of page 2180, as follows:

"Q. Is it not one of the fundamental principles of gas engineering to keep down the pressure? A. Yes, to a point where the consumers will get a sufficient supply for their appliances, the result being that of late years the demand is for a much higher pressure than when I first went into the business.

"Q. What is the reason for that, in your judgment, for that change? A. Well, you need*ly* hardly put it my judgment. It is simply the fact that since I have been in the gas business that the appliances brought in requirè higher pressure than they did in the older days, when they practically used argand and flat-flamed burners, and the superintendents of the works were nearly all hipped on the idea of keeping the pressure down, so that they would dissatisfy the consumer, and I frequently had to threaten my superintendents with discharge, for the reason that they would not supply the gas stoves and other appliances because they were either afraid there would be a leakage or afraid that I would wig them on that."

Now, I understand, or is it not a fact, that you have, as is subgested by President Humphreys, taken particular burners and particular gas, and determined by experiments various illuminating powers of the flames under various pressures?

A. I have.

3850 Q. And these experiments have been directed towards ascertaining the efficiencies of gas burners and of various burners, and the effect of pressure upon the illuminating quality of gas flame, and also to some extent as to the calorific value of the gas, that is correct, is it not?

A. That is correct.

Q. What gas did you use for these experiments?

A. I used the gas that is furnished to Columbia University, Fairweather Hall, at Amsterdam Avenue and 118th Street, which I believe is the Consolidated Gas Company's gas; the meter bears the name of the Consolidated Gas Company.

Q. Did you take any precautions during your experiments to be sure that the gas did not vary either in chemical constitution or in illuminating power?

A. I took precautions of two kinds: during many of the experiments the precautions were taken of running tests of the illuminating power to see that the quality of the gas was not changing seriously, and in other cases the supply of gas for a particular test was drawn off and stored in a small holder, so that a sufficient supply was available that would be entirely free from variation.

Q. In other words, you took the gas from the mains of the Consolidated Gas Company, drawing it into a small holder, and it was the gas from that holder that you used in making an experiment about which you are now going to testify?

A. Part of them. Not all of them, but part of them.

Q. And in such instances that you did not use this holder you from time to time checked off the gas to be sure that it did not vary in candle power during the time of the tests?

A. I did.

Q. As a standard for the candle power did you use that set down in the Act from which I now read, that is, "22 sperm candles of six to the pound, burning at the rate of 120 grains of spermicetti per hour"?

A. I did.

3851 Q. And how did you interpret that Act where it says that the illuminating power shall be given by a burner consuming five cubic feet of gas per hour? What did you take the words "by a burner" to mean?

Mr. MATHEWSON: Do you mean what he used in his experiment?

Q. What did you use in your experiment?

A. I took it for granted that in selecting a burner for the experiments on candle power to determine whether the gas supplied complied with the requirements, that the burner should be as favorable a burner to the company as could be consistently selected without going to some extreme of unusual or impracticable burner and on that account selected what is known as a Bray burner of the slit type.

Q. Is this the burner which is commonly known as the Bray No. 7?

A. Commonly known as the Bray No. 7.

Q. Is it your information that this is the burner used by the City gas examiner Love?

A. I have been informed that that is the burner which he used.

By Mr. MATHEWSON:

Q. Has he informed you?

A. No.

By Mr. KIRBY:

Q. And in your opinion this burner outside of the Welsbach or mantle burners is one which under ordinary circumstances will give tests showing the greatest illuminating power of the flame?

A. That has been my experience.

Q. In measuring the pressures in your experiments what point relative to the burner did you use as that from which to take the pressure?

3852 A. In all cases except one the pressure was taken immediately behind the opening of the burner and consequently represents the pressure under which the gas is issuing into the air.

Q. In other words, the pressure was taken where the pressure might be said as having been taken at the tip?

A. At the tip.

Q. In those experiments in which you used what is commonly known as the check burner, at what point did you take the measurements?

A. In the series of tests which I made with one form of check burner the pressures were taken behind the check and in this case represented the pressure under which the gas is passing through the check.

By Mr. MATHEWSON:

Q. Not the pressure after it has passed the check?
A. No, not in this series to which reference is now made.

By Mr. KIRBY:

Q. Now, taking up your experiments, which burner did you use for the first series?
A. The first series of tests were made with what is ordinarily called the bat-wing, lava-tipped burner, marked six foot.
Q. And how did you come to use this burner?
A. That was the burner with which I had been most familiar as a gas consumer in New York City for fourteen years, being practically the only one that I had had any experience with. It is the kind used in the apartments in which I have been living and the one which I have seen in the apartments of friends.
Q. Have you such a burner with you?
A. I have (producing a burner).
3853 Q. The burner produced by the witness and which I hold in my hand, is what in your opinion is known as the "common or garden" bat wing, lava tipped burner, with which you have had experience for some fourteen or more years in the City of New York?
A. It is.
Q. Now you used other burners in your experience, did you not?
A. I did.
Q. What other burners did you use?
A. I used a burner similar to this except marked four foot and a Bray fishtail burner, and a burner with a metal tip also of a fishtail variety, the trade name of which I do not know.
Q. Have you such burners with you, or one similar to those you used?
A. Yes (producing a number of burners).
Q. In your experiments, Professor, you used among other burners a six-foot, lava-tipped, bat-wing burner. Is this that burner?
A. It is.

Mr. KIRBY: I offer that in evidence.
Received and marked State's Exhibit X.

Q. There is no check in this burner?
A. No.
Q. You also used a similar burner, the same being four foot instead of six foot, didn't you?
A. I did.
Q. Is this the burner which you used?
A. It is.

Mr. KIRBY: I offer it in evidence.
Received and marked State's Exhibit Y.

Q. You also used a metal-tipped fish-tail burner, the same being unchecked. Is this the burner which you used.

A. It is.

Mr. Kirby: I offer it in evidence.

Received and marked State's Exhibit Z.

Q. You also used a burner similar to the burner last placed in evidence, being a metal-tipped fish-tail burner with the difference
3854 that this burner is checked. Is that the burner which you
used?

A. It is.

Mr. Kirby: I offer that checked burner in evidence.

Received and marked State's Exhibit AA.

Q. You also used what is known as a Bray No. 7, the same being a lava slit tipped burner, being a Bray slit Union, but in your experiments you removed the check, didn't you?

A. I did.

Q. And is that the burner which you used?

A. It is.

Mr. Kirby: I offer that in evidence.

Received and marked State's Exhibit BB.

Q. Now, in your tests made with the Bray No. 7, which you stated is the one which would give the greatest efficiency of the flame, and which were directed only towards the candle-power of the gas furnished, irrespective of the pressure under which it was furnished, did or did not you find that the gas was of as high a candle-power as 22 for five cubic feet burned per hour, tested in the manner set down in the statute?

Mr. Mathewson: If the Master please, I think that if we are going into the subject in this way, we are going to spend a good deal of time on something that is entirely outside the issues. The law requires that our candle-power be 22 a mile from the works, and that it be tested by the city. It frequently happens, by reason of small house pipes or some cause or another, that at a much greater distance, or beyond the testing station possibly, the candle-power may fall, but
that is nothing for which we are responsible, and it argues
3855 no violation of the law. This witness was called to testify
before the Stevens Committee, where it was a question as to
what law, as a matter of policy, should be advised. We are now met with the law as it is passed, and the question as to pressure is whether we can conform to that pressure, whether we can conform to it; and as to candle-power, if we keep our candle-power at the city testing station as required by law, our duty is performed. I do not quite understand how we are going to be advantaged by taking private tests at other points where various elements may enter in, showing that they are or not so high as 22 candle-power. We can bring in rebuttal perhaps, a great many other private tests, made at different points, showing it is above 22 candle-power at those points, if this witness says he has found it in these instances below 22 candle-power.

Mr. Kirby: May I ask from what the learned counsel infers that his tests show it was not above 22 candle-power?

Mr. Mathewson: I do not. I make the objection in entire ignorance of what the witnesses is going to testify to, but merely drawing attention to the fact that that is not an issue before this tribunal at all and that the tests, whatever their result, would be absolutely worthless and merely a matter of interest, but of no earthly value in the determination of this case.

The Master: It does not appear here, Mr. Kirby, does it, that the place where these tests were made, was at a distance or not less than a mile from the distributing holders?

Mr. Kirby: No, it does not. There is no contention that
3856 they were. The contention is that the witness qualified to
make the experiments which he has made, and to give the testimony which he is about to give, in the course of those experiments, found it necessary to take tests of the candle-power of the gas which was furnished by the complainant in this action. Whether those tests were made a mile away or two miles away or right at the holders, nevertheless, they show and have a considerable bearing upon the candle-power of the gas which is being furnished, and certainly if not by themselves, at least in conjunction with the tests made under the strict regulations of the statute, that is a mile from the works and under the other conditions set down therein, would not only be relevant, but certainly, I should think, in every way material to a proper consideration of that question. Now, as a matter of fact, the testimony is not directed towards this one of candle-power of the gas more than it has to do with the experiments which he has made and about which he is about to testify.

The Master: That is what I wanted to get at, are the questions that you are about to ask him directed primarily to the matter of pressure?

Mr. Kirby: No, sir; they are not.

The Master: Or simply as to the question of candle power alone?

Mr. Kirby: The question of candle power as it is affected by pressure.

The Master: And do these tests have any bearing on the question of pressure, or are they limited to candle-power?

Mr. Kirby: They have a bearing upon both. The testimony in this case has been from many witnesses of the complainant that the requirements of the Statute are not only impossible in the
3857 compliance therewith, but are unwise and impracticable; and
especially the testimony of President Humphreys, to which I have drawn attention, is to the effect that there should be no such requirement? Now, these experiments will show the grave necessity for such requirements, and before we are through with this and other witnesses, I think we will find that not only is the act a proper one, but that the compliance therewith is practicably possible. That is the raeson for this testimony and the reason for other testimony which we will produce.

Mr. Mathewson: Let me call the Master's attention to the fact that this Act providing for the tests of candle-power is merely a general act and that it is provided in the City Charter, and by amendment to the City Charter made at the same time that this act was passed, that the tests contemplated in this Act should be made in each borough of the City and by the City Inspectors, so that if we were to be charged with failing to keep up candle power, we could only be charged on the basis of the inspection by the City. That, I think, will be conceded.

Mr. Kirby: There is no contention to the contrary.

Mr. Mathewson: Now, Mr. Kirby says that he proposes to show the candle power as affected by pressure. It is not a question of discretion before this Tribunal as to what Act shall be passed. We have an Act now. It does not make a particle of difference how candle power is affected by pressure. If we could observe the law that had been passed, providing that the pressure should be kept within 2½ inches and 1 inch, between that limit of one and one-half inches, and still deliver gas to our consumers for their requirements,
3858 it would not make a particle of difference to the Master and we could not complain, if that unwise legislation had been passed. The point is that if we maintain the candle power at the figure required by law, we are not subjected to any penalty. But that is not before the Master, but the question before the Master is that we claim that we cannot maintain the pressure within the limits provided by that law. If we can, what the effect will be of maintaining it within that limit is something with which the Master has nothing to do. That is a legislative discretion that has been exercised, and the consumer must suffer, even if it be unwise, if we can accomplish that result. So I cannot see how the question of "how candle-power is affected by pressure," to use the expression of my friend, Mr. Kirby, is a subject which it is worth while to go into here. It is entertaining, but it is certainly not an issue upon which this case can turn.

Mr. Kirby: Such might indeed be the case, Mr. Master, were it not for the testimony which has been put in by the complainant, and this testimony is largely in rebuttal of that and contradictory to it.

Mr. Mathewson: We put in no testimony, Mr. Kirby, except as to the ability to maintain that pressure requirement, and in that connection merely.

The Master: Do you mean testimony put in to the effect that it is impracticable to maintain a candle power of that kind without furnishing candle power that is really in excess of that by measurement?

Mr. Kirby: No, I do not. I mean the testimony has been put in in this case and there are pages of it, to the effect that the
3859 necessities of the present time require a pressure different from that set down in the statute; and even going so far as to contend by such testimony as that pressure regulation, except in a minimum amount, should not be enacted, or if enacted, should be held contrary to the proprieties of the situation and unconstitutional therefore under the act.

Mr. Mathewson: No, not for that cause unconstitutional and because it is unwise, but because it is impossible of performance by us and imposes a penalty upon us for something which we cannot perform. Now, if Mr. Kirby will read the testimony carefully, he will find that in the direct testimony of the witnesses produced by complainant, we did not ask them as to the wisdom of that provision at all, but simply as to the possibility of carrying it out in practice, and these other questions which he now says were asked, were asked in cross-examination. The only question we may have asked in direct-examination to which he has referred would be the question as to whether there was a maximum regulation elsewhere in the world, of candle power, merely to show the probability of its having been impossible to regulate the maximum; that is all, not the effect of the pressure. And I think the Master will see——

The **Master**: The difficulty in my mind is that I do not see the relation here between the question of candle-power and pressure. If the object of this testimony is to show that the gas company has maintained at the spot where the Professor made his tests a pressure of less than 22 sperm candles, it does not show anything so far as I can see concerning a violation of this law. I do not see how it affects, so far as anything yet made clear to me, the question of press-
3860 ure. If, on the other hand, the object of the testimony is to show that they maintain as a matter of fact an illuminating power of more than 22 sperm candles, I can see that it might have some bearing on the testimony already in the case as to the practicability of maintaining an equable candle-power without necessarily supplying gas of a higher candle-power than that required by the Statute. But Mr. Kirby disavows that and——

Mr. **Kirby**: Not that I disavow it, but I say it is incidental to the main purport of these questions and of this testimony.

The **Master**: I do not see, Mr. Kirby, what it has to do with any of the questions before me, on your statement.

Mr. **Kirby**: It would have—I concede the irrelevancy of the testimony, were it not that by reason of such testimony as has already been put in, parties representing the State in this matter consider that it is necessary to rebut such statements and inferences as have been made, to the effect that a pressure regulation except for a minimum requirement is unwise, improper and not in use elsewhere, and that therefore the pressure requirements of the Act are not only impracticable of performance, but are unwise and unjust.

Mr. **Mathewson**: Do you think the Master could declare this Act unconstitutional if he found we could perfectly comply with this pressure regulation and still furnish gas to our consumers, but on the whole that the legislation was unwise? I am not crazy enough for an instant to ask the Master for such a finding as that.

Mr. **Kirby**: I think not, but the testimony is there, and
3861 as such we are prepared to meet it, and that is our reason for producing this witness.

Mr. **Mathewson**: A great deal was asked on cross-examination of our witnesses and perhaps there may have been something along the line of wisdom, but it was not asked by us and I make no point, and I do not assert that the unwisdom of the statute, if it be merely a matter of unwisdom, is sufficient basis for declaring this law unconstitutional.

Mr. **Kirby**: As I have said ofttimes before, that is a legal proposition subject to argument and about which you and I would probably not differ.

The **Master**: Did you call attention to any testimony of the complainant on direct-examination which in any way shows a connection between this question of pressure and candle-power?

Mr. **Kirby**: I did not, but I have no doubt there is much of it. I think the specific statements which I referred to were in the cross-examination——

The **Master**: I see in the testimony of Dr. Humphreys that an increase of pressure means a decrease of candle-power, but that was gone into on cross-examination by Senator Page. I do not recall any direct-examination on that subject. I think the direct-examination was limited simply to the question of practicability of maintaining the pressure provided by the Act.

Mr. **Mathewson**: I think so, as I conducted the examination, the practicability of observing the Act, not the wisdom of passing the Act.

3862 The **Master**: I do not wish to curtail in any way the scope of your evidence, Mr. Kirby, but at the same time I hesitate, in view of the great volume of material we have here already, in opening up a line of proof that may involve considerable time, unless I am convinced of its materiality.

Mr. **Kirby**: If it be the fact that there is no direct testimony on the part of the witnesses of the complainant to the effect that I have tried to indicate, and if from that fact it follows, that testimony of the kind which is here produced is not relevant or material, then certainly such testimony as is in the record under cross-examination would not be relevant or material, and if the Master is prepared to rule that the rebuttal of such testimony is not competent, why, I will take an exception and take about ten minutes to put it in under the rule. But the Master will certainly find much upon the point.

Mr. **Burr**: I call the Master's attention to page 2100, the examination of Dr. Humphreys.

The **Master**: Yes, that is on cross-examination, I think.

Mr. **Mathewson**: Yes, on cross-examination. Was it cross-examination by Senator Page?

The **Master**: Yes.

Mr. **Mathewson**: And he is associate counsel for the State.

Mr. **Kirby**: The question asked, however, is certainly relevant. Such questions as may be asked may under your ruling have a contrary bearing——

3863 The **Master**: It is the question as to the general line of testimony that we have been considering, as to the subject of these individual tests on the subject of candle-power. I do not myself see the materiality of it. I think I will sustain the objection and let you put it in under exception.

Mr. **Kirby**: You will not reject the testimony in answer to this question as to whether he found the gas he experimented with to be over or under 22 candle-power, because that has a direct bearing upon all the testimony which is put in.

The **Master**: I will let him answer that.

Mr. Mathewson: If this testimony goes in, whatever it may be, and although it is excluded and goes in under an exception, I shall of course feel at liberty to present anything in rebuttal of it I see fit. And I have not made any objection here because I have hesitated at all to meet the proposition, but merely because it did seem to me to be outside the issues and to be consuming time.

Mr. Kirby: I do not think we will find the time consumed of any considerable length. Will you read the question.

(Stenographer reads question as follows: "Now, in your tests made with the Bray No. 7, which you have stated is the one which would give the greatest efficiency of the flame and which were directed only towards the candle-power of the gas furnished, irrespective of the pressure under which it was furnished, did or did not you find that the gas was of as high a candle-power as 22 for five cubic feet burned per hour tested in the manner set down in the Statute?")

Mr. Mathewson: I wish to make an objection that it is not rebuttal of anything offered on the direct, and that it is also immaterial and irrelevant to any of the issues before the Master, and I understand the Master's ruling to be——

3864 Mr. Kirby: The Master has not ruled against that question.

The Master: Now that it is read, I think I do rule against it. When you put it a moment ago to me, you asked as to whether it was greater or less.

Mr. Kirby: I will withdraw that question and will put this question.

Q. The gas which you use in the experiments and which you tested as to its candle-power, did you find that it was of a greater or less candle-power than 22, being the illuminating power required by the statute?

Mr. Mathewson: Same objection.

The Master: Objection overruled.

Mr. Mathewson: Exception.

A. I found that on a consumption of five cubic feet per hour, the candle-power was above 22.

Mr. Kirby: Now, the questions which I am about to ask have to do with the experiments made by the Professor, which go to show the change in the illuminating efficiency of the gas due to the variation in pressure, and I understand that those questions are objected to and the objection is sustained and I except and I put them in under the rule.

Mr. Mathewson: And I may, without objecting to each one, be understood as having objected to each one?

The Master: Yes.

Mr. Kirby: That is what I understand.

Mr. Mathewson: Then I shall not interrupt the witness.

Mr. Kirby: We wish to take up as little time in this under the circumstances as possible.

3865 Q. Your experiments have been conducted mainly to show the effect of variation in pressure upon the illuminating efficiency of the gas, have they not?

A. They have.

Q. In the types of burners which you have used, and which types have been placed in evidence, at what pressure did you find the point of greatest efficiency for 22 candle-power gas?

A. In practically all cases, under a pressure of one inch at the tip.

Q. In the bat-wing burners, being State's Exhibits X and Y, did you find that the point of highest illuminating power per unit of gas was below an inch and if so, at about what point?

A. I found that the maximum efficiency was attained at pressures in the neighborhood of half an inch at the tip.

Q. What change did you find as the pressure increases to one inch?

A. The efficiency gradually decreases as the pressure under which the gas is consumed increases.

Q. And is this more particularly true as the pressure increases from one to two inches than from one-half inch to one inch?

A. It is, yes. The decrease in efficiency is generally more rapid after pressures of one inch to one and one-quarter inches are passed.

Q. Now from two inches on, what do you find is the effect of pressure upon the illuminating powers?

A. From two inches on, the illuminating power of the flame decreases very rapidly, and in most cases becomes practically non-luminous at pressures of about three to three and one-half inches, and is actually blown out by pressures ranging from seven to twelve inches.

Q. And is this generally true of all open flame burners, such as you have experimented with?

A. The experiments were only carried to moderate pressures in the other forms of burners, but up to pressures of one and 3866 one-quarter to one and one-half inches, the effects were the same.

Mr. Mathewson: The same as——

The Witness: As in the bat-wing.

Mr. Mathewson: The two bat-wing burners?

The Witness: Yes.

Q. Did you also make experiments with the mantle burner which is commonly known as the Welsbach burner?

A. I made some experiments with the Welsbach burner. In this case the conditions are more complicated owing to the more complex regulation of the mantle burners, and I found that a Welsbach burner that had been regulated for a lower pressure maintained practically the same candle-power as the pressure increased up to a point where the regulation was no longer satisfactory and consequently the efficiency fell off very rapidly. On the other hand, a burner regulated for a high pressure became inefficient at low pressures.

Q. Would a general statement to the effect that in a Welsbach burner the pressure will not produce any greater candle-power per unit until it reaches some high figure, such as twenty or thirty inches be true?

A. I believe that the pressure under which the gas is furnished to the Welsbach burner would not produce any variation in its efficiency if properly regulated to the pressure until the gas is under sufficient pressure to produce a flame of an entirely different character, and this would probably require some such pressure as that referred to.

Mr. Mathewson: Twenty or thirty inches.

The Witness: Twenty or thirty inches.

Q. If a Welsbach burner were regulated by the ordinary 3867 attachments which are upon such burners for the pressure of gas at one inch and such pressure were increased, would or would not the efficiency of the flame increase in accordance with the experiments which you have made?

A. The efficiency would not increase but would in general decrease.

Q. You have also made some investigations in regard to pressures applied to the use of gas for fuel, that is in stoves and other appliances which use illuminating gas in that way. What is your conclusion therefrom relative to the need for pressure and as to how high such pressure should be for such appliances?

Mr. Mathewson: Well, is this based upon experiments and if so, it seems to me the results should be given. I do not think this witness is competent to speak on that subject, it is a conclusion. He has never operated a gas plant or been in the gas business so far as I know. It has not been shown.

Mr. Kirby: Certainly he is qualified to speak as to whether or not gas under certain pressure produced the best calorific power for gas stove or range or anything of that kind. A man does not have to operate a gas business to be competent to testify as to what the heating effects would be. A physicist who has spent all his life, you may say, in making experiments of that kind is certainly as well qualified as one who has run a gas works.

Mr. Mathewson: I think the question is too broad and I object and make a further objection in addition to the standing objection.

The Master: This comes under the same objection as the other testimony. The testimony is of the same general character, I assume?

Mr. Kirby: Yes.

3868 The Master: I will consider it in the same way and sustain the objection upon the ground of materiality and relevancy and give you an exception.

Mr. Kirby: Exception.

A. I have made tests showing that the actual calorific value of gas when burned at different pressures is practically the same and the question of the practical efficiency of the gas for heating purposes as affected by pressure depends upon the burner and stove conditions under which it is consumed and for appliances of this sort of the character in general use.

Mr. Mathewson: Did you mean gas ranges?

The WITNESS: Gas ranges, gas burners and gas heaters, do not require a pressure of over an inch at the tip.

Q. Now, you have set down the result of your experiments, and the deductions therefrom in certain tables, and I ask you if the result of experiments with the commercial 6-foot lava tipped bat wing burner, being States Exhibit X, are correctly set down in the three tables headed "Series 1, five tests; Series 2, six tests; Series 3, four tests?

A. They are.

Q. I ask you if the result of your experiments with the commercial 4-foot bat wing lava tipped burner, the same being Exhibit Y, are correctly set down in a table headed, Series 4, commercial 4-foot bat wing lava-tipped burner, four tests?

A. They are.

Q. I ask you if your experiments with the Welsbach burners are correctly set down in a table headed, "Welsbach against Argand,"
Series 5, three tests, regulated for 1.54 inch pressure, and in
3869 another table, the same being headed, "Same burner regulated for 2.35 inch pressure?"

A. They are.

Q. The latter table being series 6 of experiments?

A. Yes.

Q. I ask you if your experiments with the commercial 6-foot fishtail burner, No. 5, with the check removed, being State's Exhibit V, are correctly set down in the table headed, "Table 7, Commercial 6-foot fishtail burner, No. 5, Check removed?"

A. They are.

Q. I ask you if the result of your experiments with the burner, State's Exhibit AA, are correctly set down in the table headed, "Series 8, being commercial fishtail No. 5, checked?"

A. They are.

Q. I ask you if your experiments with State's Exhibit BB are correctly set out in table headed, "Series 9, Bray No. 7, Standard?"

A. They are.

Q. And I ask you if the tables and statements headed, "Bat wing lava tipped commercial 4-foot, bat wing lava tipped commercial 6-foot, and Series 10 and Series 11" are further results of your experiments with such burners, being State's Exhibits X and Y?

A. They are.

Mr. KIRBY: I offer these statements in evidence.

Papers received and marked State's Exhibits CC, DD, EE, FF, GG, HH.

Q. In these tables which have been placed in evidence, and especially those marked State's Exhibits CC, DD, FF and GG, you have indicated under various pressures the rate of burning in cubic feet per hour and the actual candle-power of the flame, the efficiency of candle-power per cubic foot per hour the candle-power for five cubic feet per hour and what 200 hours of 22 candle-power light under those various conditions would cost with gas at 80 cents 3870 and what such 200 hours of 22 candle-power light would cost under those varying conditions with gas at $1.00 per thousand cubic feet, have you not?

A. I have.

Q. Have you taken the results of your experiments, shown in pages 1, 2, 3 and 4 and reduced them in the form of two curves, one showing the candle-power per cubic foot per hour and the other the cost of 200 hours at 22 candles, and if so is the chart which I show you the result of your experiments and the computations therefrom?

A. I have done so, and the chart is the result of those calculations and that plotting of the curve.

Mr. Kirby: I offer that in evidence.

Paper received and marked State's Exhibit II.

Q. From such chart can you tell us what effect the increase in pressure has upon the cost or of the illuminating efficiency of the light or illuminating power of the light.

Mr. Mathewson: Does it not show in the diagram he has made from his experiments what they show. He says this graphic print illustrates it.

Mr. Kirby: I want him to say it in words.

A. It shows that in the experiment in question the effect of the increased pressure from .4 of an inch to 1.35 of an inch resulted in an increase of the cost of 22 candles of lights for 200 hours from 86 cents at .4 of an inch to $1.26 at 1.35 inches.

Q. Have you, Professor, assisted Mr. H. H. Edgerton in making certain tests and taking certain readings upon and in reference to the pressure of the gas furnished by the Consolidated Gas Com- 3871 pany where the same is supplied to the buildings of Columbia University?

A. I have.

Q. Are you familiar with the apparatus with which such experiments were made?

A. I am.

Q. Do you consider that such apparatus is one that is proper for such experiments?

A. I do.

Q. Do you consider that such experiments were made in a proper and scientific manner?

A. I do.

Q. And that the calculations therefrom as the same have come under your observation are accurate and correct?

A. I do.

Mr. Kirby: That is all.

Recess until 2:15 P. M.

After Recess.

WILLIAM HALLOCK resumes the stand.

Cross-examination by Mr. MATHEWSON:

Q. You stated that you were Professor of Physics. I think you testified before the Stevens Committee that you were not a chemist, did you not?

A. I am not what would professionally be known as a chemist. Naturally, however, a physicist nowadays has to know more or less chemistry.

Q. Have you ever had the management of any industrial concern, or has your life been devoted to your profession of teaching or learning?

A. I never have had charge of any industrial concern. I was for nine years physicist for the United States Geological Survey.

Q. Have you ever been connected with any gas or electric business?

A. Commercially?

Q. Yes.

A. No.

3872 Q. Referring to the subject of electrolysis, you say that the damage does not occur where it occurs in gas pipes by the entry of the current into the conductor. It does occur, does it not, as an effect of the leaving of the conductor by the current?

A. Yes.

Q. Now, as a matter of fact it is not true, is it, that a current of electricity, and the entire current, follows the best conductor?

A. The current, if it has a choice between conductors, will divide in inverse proportion to the resistance of the path.

Q. Precisely, so that if electricity has a good conductor, and there comes in contact with the current a much poorer conductor, a portion of it will follow the poorer conductor although the greater portion will continue with the good conductor, is that right?

A. That is right. In inverse proportion to the resistance to the current along any path.

Q. Now, having settled these points on which we agree, let us find what you mean by a solution. You have stated that a current, for instance, in leaving a pipe, in order to do damage to the pipe, must meet some sort of a solution, did you not?

A. Yes, sir.

Q. What is a solution, as you define it, in that connection?

A. I should define it in that connection as water in which certain salts are dissolved by certain substances.

Q. Well, would you really say water? Is not moisture or dampness which exists in the ground a solution or may it not be a solution without being in such form that you could dip it up in cups?

A. Oh, yes.

Q. In other words, a solution may mean simply moisture, may it not?

A. Moisture as it occurs in the ground is in general a solution.

Q. And it is in fact in pretty nearly all ground except very sandy ground, and even there when you get down a little you find moisture is in it?

A. Yes.

3873 Q. Now, you spoke about the salts in solution being absorbed, did you not, or something of that sort when traversed by an electric current?

A. Decomposed.

Q. Is it true that the salts resulting from iron are decomposed, or if decomposed are they not merely changed in character without being destroyed?

A. The salts of iron if in solution—the action upon the salts would depend upon whether you had in mind the point where the current enters the solution or where it leaves the solution.

Q. Well, make the distinction yourself?

A. In the place where the current leaves the solution the end result would be the production of metallic iron; and the place where it leaves the conductor to enter the solution, the other component of the salt would be liberated and might or might not indicate a secondary decomposition.

Q. Well, the moisture of the ground which would carry a salt, or might, would be constantly renewed in a climate such as this by the action of the elements, wouldn't it, even if they were disposed of to some extent, currently, by the electric action?

A. Likely to be.

Q. When once disposed of it would not follow it might not be there again next day?

A. If it happened to be under an asphalted street there would not be very much there the next day.

Q. Don't you think that the soaking in or absorption in one form of action or another of moisture from sewers and from the ground which becomes dampened by sewers, would be felt?

A. Undoubtedly to some extent. It would be a quantitative question rather than a qualitative one.

Q. And when the current leaves the pipe and meets with these solutions that is when the pitting occurs in the pipe, isn't it?

A. Yes.

3874 Q. You spoke about it being necessary, or rather Mr. Kirby did, that there should be sufficient voltage for decomposition of the solution in order to set up this action. What would be the minimum voltage required for that purpose?

A. It would depend upon the metals involved and upon the nature of the salts in solution.

Q. Well, if you take the ordinary cast-iron pipe such as we find in the mains in the City of New York generally and such salts as you ordinarily find here——

A. I would say that that would be according to those circumstances somewhere between possibly one and five volts at the actual surface.

Q. At the point of leaving the pipe?

A. Yes.

Q. How would it be with wrought iron?

A. It would be very much the same.

Q. Now, I assume as a matter of course that the multiplication of the subways in the City of New York and the use of electricity on the elevated road where they do not have especially return conductors as they do for the street surface railways, would tend to increase the number and importance of stray currents in the earth, would they not?

Mr. Kirby: The Professor has testified——

Mr. Mathewson: Other things being equal?

Mr. Kirby: Then assume that that is so, and do not make the witness by his answer infer that what you say is so.

A. The conditions, if any further change in any other respect were made to increase the quantity of electricity we use would naturally be to increase the stray currents.

Q. And assuming that there is no insulated return conductor provided for the current, such a condition would tend to let more currents astray than if you were dealing with an insulated system, would it not?

A. Yes.

3875 Q. And would the electrolysis, in your judgment, if it once got fairly in operation be a serious menace to the integrity of pipes, especially of iron pipes?

A. Certainly, if it got fairly at work and kept up working it would be a menace to pipe.

Q. Have you read in connection with your readings the statement of Mr. Cowdery, the manager of the Laclede Gaslight Company, that the services in St. Louis in cases under his personal observation have to be renewed once in two or three weeks on account of their destruction on account of electrolysis?

A. I have not.

Q. If that be true, that would indicate a very serious situation, would it not, in a distribution system?

A. It would if it were true, yes.

Q. Now, in reference to the candle power and pressure, you say you used in your experiments the gas which you obtained at Fairweather Hall, Amsterdam Avenue and 118th Street?

A. Yes.

Q. Were all of these tests to which you have testified and which are shown in these tables which you have presented, obtained with that gas ?

A. They were.

Q. And in each of these tables was the gas drawn for your experiment from the tank into which you had first segregated it?

A. As I believe, in series of seven and eight.

Q. That is Exhibit FF. As to the other sheets, your tests were made by the gas furnished directly from the burner or service pipe of the company without first being drawn off into a separate tank?

A. Yes.

Q. You said at the outset that you checked the gas as to chemical composition, did I understand?

A. I certainly intended to convey no such idea. If I answered the question so that it conveyed that idea I should like to correct it. I made no chemical tests further than of illuminating power.

3876 Q. You did not make any tests of this gas to determine its chemical composition as to specific gravity or the amount of the possible ingredients, Marsh gas or otherwise, which entered into it?

A. No.

Q. Of course the specific gravity of the gas is influenced, is it not, by the elements of which it is composed, even with the same candle power?

A. Yes.

Q. And so, too, the calorific value of the gas, the heat units are influenced by the constituents of the gas?

A. Yes.

Q. And a coal gas of a certain candle-power will have a greater value of calorific value will it not, than a water gas of the same candle-power?

A. That I don't know. I never made such tests.

Q. When were these tests made indicated in these statements?

A. They commenced about the first of October and practically all of them were included in the month of October.

Q. 1906?

A. 1906.

Q. What does this mean on the table, State's Exhibit CC, "X.1. 1906"?

A. It means the series was made on the 1st of the 10th month of 1906.

Q. And the similar characters on the other sheets similarly indicate the date?

A. The date on which the series was made.

Q. The hour does not appear to be stated in these tables, at which your experiments were made?

A. No.

Q. Are you able to state the hour at which they were made?

A. I am not.

Q. Were they made in the daytime?

A. Some made in the daytime, some made in the evening, some made pretty late at night.

Q. Were they made in the afternoon or evening, most of them?

A. No, I think most of them were made in the forenoon or evening. The first series I happen to remember was made in the evening.

3877 Q. State's Exhibit CC?

A. Yes, the first series.

Q. Now will you describe in detail the method which you pursued in reaching the candle-powers indicated on these charts. In the first place, assume that you did not use the jet photometer, as you did before the Stevens Committee, did you?

A. I used a jet photometer as I used when working for the Stevens Committee for certain purposes, and I used the same apparatus as I use for determining the absolute candle-power.

Q. As you used then?

A. No, as laid down in the law. The law says, "candles." I should not, as long as working out my ideas—scientific ideas, resort to candles.

Q. What would you resort to?

A. I should consider by all odds the electric standard is the best standard at the present time.

Q. You would not consider a jet photometer was a scientifically accurate instrument?

A. It was not used as a standard.

Q. You would not consider it a scientifically accurate instrument?

A. No, sir, I should not.

Q. You used the ordinary bar photometer?

A. I used the ordinary bar photometer, yes.

Q. Did you yourself make these observations?

A. I did.

Q. Is it a bar photometer which is in use in the laboratory of the university?

A. It is a bar photometer which was put in there for these tests.

Q. Who was the manufacturer of this photometer?

A. The American Meter Company.

Q. Had you had experience in the use of the bar photometer before this was put in?

A. I had.

Q. Extensive.

A. Very extensive.

Q. When was this put in?

A. This was put in about the first of October.

Q. Did you use sperm candles?

A. I did.

3878 Q. How were the standard verified? Were the candles weighed by you?

A. Yes.

Q. Did you find that their weight corresponded with what it purported to be?

A. Yes.

Q. Now, will you state the steps you took in getting the candle-power?

A. In determining the candle-power according to the statute, the burner was placed at one end of the bar, the gas passing through the meter, and in my case with the proper arrangement for measuring the pressure at the tip of the burner and passing through a regulator to maintain the pressure uniform. The burner in question was regulated as to flow of gas until the flow was as nearly five cubic feet per hour as practicable, and then at the other end of the bar is

mounted the so-called candle balance in which two standard candles are mounted upon one arm of the balance and the distance from the candle to the burner to be tested is the length of the so-called bar. The candles are lighted and after they are in proper condition, burning long enough to get in practical uniform condition, the test is commenced and the time of the test is started when the pointer on the candle-balance passes the zero mark. The weight is adjusted first so that the candles are slightly too heavy for a perfect balance, as they burn down they become lighter and as the pointer indicates a perfect balance the experiment commences. Then during the experiment the rate at which the standard burner is consuming gas is observed, and a series of settings of the screen is made on the bar. This series of readings usually consists of a series of ten made approximately one minute apart. The test ordinarily is arranged to last for ten minutes during which time the candles are supposed to burn forty grains. Before the end of the test two small weights equivalent to forty grains are placed in the pan with the candles whereupon the pointer passes again into the light side of the
3879 zero and the experiment is continued until the pointer passes the zero mark again and the time is taken. Then there are two corrections that are to be applied to the average of the settings taken during the test. One is to test for the consumption of gas provided the burner did not consume exactly five cubic feet per hour, and the other is to test the candles which may not have burned exactly at the rate of 120 grains per hour.

Q. You reweighed the candles after the conclusion of the test to see what had been burned?

A. I did not. The amount that has been burned is determined by the addition of the small weights representing what the amount that is supposed to be burned during the test would be if they burned at the normal rate consumed in ten minutes.

Q. Is not the amount usually burned checked up by reweighing the candles at the conclusion?

A. That is practically impossible because that would mean that we would have to start the candles at the beginning of the test, light the candles at the beginning of the test, because you would have to weigh the candles at the beginning of the test; then you would have to light the candles and they would burn irregularly. It takes you some time to get ready and start it up; and if you stop the test by blowing the candles out, that is perhaps more easily possible than starting them up accurately; but the ordinary method, and it seems to me the much better method, much better approximating to something like scientific accuracy, is to determine the loss as is customary by the time required to consume a certain weight.

Q. You refer to the screen. I assume that that is the same as the disc, isn't it, which is moved back and forth on the bar?

A. Yes.

Q. Which gives it the name of the disc photometer sometimes?

A. Yes, it is called the disc photometer. They use all
3880 sorts of screens on the bar photometer, however.

Q. Was not this a disc or corresponding discs on two sides of a triangular block?

A. Some of the tests were made with a disc screen and some of them were made with the star screen. They are essentially identical in operation. Some observers prefer the star shape to the disc and some prefer the disc to the star shape.

Q. Did you make any correction for temperature?

A. Temperature of the room?

Q. Yes, in your experiments?

A. I did not.

Q. You burned, of course, nothing for barometer?

A. No, nothing for barometer, nothing for state of moisture in the atmosphere.

Q. Was the room in which the photometer was located well ventilated?

A. It was a large room, a room about thirty feet spare and sixteen or eighteen feet high, and aired by ventilators, the ordinary ventilator, supposed to be ventilated. I am not prepared to testify as to the efficiency of our ventilating system up there.

Q. Was there sufficient movement of air so that it might have affected the tests, do you think?

A. I think not, no.

Q. Now, in Series VII, Exhibit FF, we observe that you put down a pressure of .14 of an inch. Will a flame under that pressure stand firm in the ordinary room?

A. No, it does not. It is a very flabby, wavy flame.

Q. How did it go in the room where you were making your tests?

A. It was of that character, a wavy, flabby flame.

Q. It is not one that would ever be commercially used or usable?

A. Not if they could get anything else probably.

3881 Q. So that when you compute the value of that commercially on table 7, comparing it with the gas furnished under other pressure, that would be purely theoretical as far as the gas with a pressure of .14 of an inch was concerned, wouldn't it?

A. I don't know as I exactly catch the point. It is a positive fact if they burned it under that pressure they would get that efficiency.

Q. But nobody would ever burn it under that pressure?

A. Well, that is another question.

Q. You would not even get that efficiency in a living room with the current that prevailed, would you, at a pressure of .14 of an inch?

A. You would get the efficiency, you would get the candle power per cubic feet of gas used. People would not like the form of illumination though.

Q. There would be a call for higher pressure, wouldn't there, in that case, Professor?

A. There probably would be.

Q. Now, in the course of an examination of these tables I observe that in practically every instance, perhaps every instance, you give the greatest efficiency for the lower pressure, judged by the candle power for cubic feet per hour burned, or for five cubic feet per hour burned, don't you?

A. I do.

Q. You certainly do not mean to say that the gas burned in an open flame burner shows its greatest efficiency in practical use with a pressure under one inch, do you?

A. At the burner, yes.

Q. Well, I read in your affidavit, and you will correct me if I am wrong, after quoting Doctor Chanler—your affidavit in this case verified June 1st, 1906—you say:

"Doctor Chanler also with accuracy pointed out that gas at a pressure of less than one inch lost much of its illuminating efficiency."

How do you reconcile the two statements?

3882 A. Professor Chandler pointed out with reference to the test I referred to in his case there, the circumstances as to the particular efficiency. The particular pressure at which you get the highest numerical efficiency depends upon several factors; it depends upon the quality of the gas and particularly the gas involved in that particular experiment which possibly President Humphreys specifically pointed out in his testimony. It is impossible to say any more than to state the case for the particular burner under consideration and the particular gas.

Q. Well, you still stand by this statement that Doctor Chanler pointed out with accuracy that the gas at a pressure of less than one inch lost much of its illuminating efficiency, do you not?

A. That was in that case; that was the case cited there to which I was referring, I am confident.

Q. But that was the case where an examination was made of gas and tests made at the various pressures, wasn't it, of gas of the Consolidated Gas Company?

A. I don't know.

Q. Don't you remember he testified to his experiments with gas of the Consolidated?

A. I remember that I took in the affidavit the results given by Doctor Chanler and pointed out certain conclusions from them.

Q. Then in the gas which Doctor Chanler did use it did appear and was pointed out by Doctor Chanler with accuracy that at a pressure of less than one inch that gas lost much of its illuminating efficiency?

A. That is perfectly true, because you lose if you go on down; any gas will lose in efficiency if you go down to the pressure where you practically get no illumination out of it at all.

3883 Q. But, your best results appeared to be obtained, according to these tables, with the gas at a pressure under one inch and very substantially under one inch; in one case .14 of an inch, next case .58 of an inch, .4 of an inch, .3 of an inch, .2 of an inch, and so forth, and yet you have said that with the first of these, gas at .14 of an inch, the pressure would not be commercially useful. Do you mean to announce it as a general proposition that gas such as is now distributed in the City of New York according to your observation will actually show a better result under one inch pressure; or is that merely the result of these particular experiments and depending upon particular circumstances?

A. I think that measuring the pressure at the tip of the burner, that all of the evidence goes to show that the actual candle-power per cubic foot of gas consumed is greater when burned in the proper burner under pressure less than one inch.

Q. But, take your first table, Exhibit FF. You mean to say that gas burned under .14 of an inch pressure was a situation to be advised, would you, for ordinary commercial use?

A. That would depend upon circumstances. These pressures are taken at the burner and it would depend upon the particular burner. The burner that you refer to in question is——

Q. Fishtail No. 5, check removed?

A. Check removed. And it is a burner that is absolutely not adapted to low pressures.

Q. No, exactly. Then you would not advise burning gas at .14 of an inch pressure through that particular burner?

A. Certainly not.

Q. Would you advise the burning of gas at .21 of an inch pressure through that burner for commercial use?

A. I cannot say exactly because I don't know what the pressure is in these burners between the check and the tip. This burner is a rather efficient burner when burned with the check in and what the pressure is between the check and the tip I haven't tested so that I don't know what would be the particular efficiency.

3884 Q. When we come to the next pressure in this same table, Series VII, I find the third pressure .62 of an inch and that the candle-power for five cubic feet pressure is 10.2, but at .97 of an inch pressure, or 50 per cent. more, I find that the candle-power per five cubit feet burned has arisen to 10.3——

A. That burner is very erratic in its behavior, as the evidence shows; and that series was simply put in as an illustration of what happened when somebody gets out of patience with a check burner and pulls the check out.

Q. Now, in obtaining these pressures what process did you pursue in obtaining the exact pressure which you have employed here?

A. They were measured in most cases on the lower pressures, particularly on a delicate *guage* which I think is sometimes referred to as an "arch manometer," from the fact that the divided circle is in the form of an arch over the mechanism. The variations in pressure there can be read very accurately as the total pressure of something like one and one-half inches of water is spread out over a distance of twelve or fifteen inches.

Q. Who assisted you in making the proper tests or did you take them yourself?

A. In most cases I took them myself. In other cases Mr. Edgerton assisted me.

Q. Did you verify all these readings yourself? A. I did.

Q. How did you proceed to get the pressure where you had drawn the gas off to a tank and employed the gas in the tank for your experiment?

A. To control the pressure?

Q. Yes.

A. It was measured in the same way.

Q. How did you control it in that case?

A. By loading the receiver or loading counterweights on it for the low pressures.

Q. Now, you observe taking the first Exhibit CC, Series 7, 3885 that the first four of your five pressures would be below the rate which the law compels the company to deliver.

Mr. Page: Objected to, as assuming something which the law does not provide. The law provides for a pressure in the mains and does not regulate it at the tip.

Mr. Mathewson: Very good. I think that is perhaps fair criticism of the question.

Q. What would be the difference in pressure between the main and the burner?

A. That would depend upon the distance of the burner from the main of pipes connecting the two, and the other consumers in the neighborhood of the burner drawing from the same feed pipes.

Mr. Mathewson: I am very glad the Senator made that objection because it disposes of the suggestion that the service pipes could be meant.

Mr. Page: Oh, no. If you do not know the difference between a service pipe and a house-pipe you had better study it up.

Mr. Mathewson: There isn't very much difference, not where they make these tests at Columbia College.

Q. Supposing you take the ordinary service running to the main in the street at the distance at which the services which you used are from the main?

A. How far from the main?

Q. Yes.

A. I suppose we were practically from fifty to seventy-five feet from the curb. I don't know whether the main is on our side of the street or the other side. That would make perhaps fifty feet difference.

Q. How long was your house-pipe from——

A. I beg your pardon. Perhaps I did not understand 3886 that. I thought you asked our distance from the main.

Q. So I did. And now I ask the length of the house-pipe which runs, I suppose, vertically, something like that up from the service, doesn't it?

A. We were just about on the level with the top of the meter, we were only a few feet above the top of the meter.

Q. What would you think under those conditions the difference would be between pressure in the main assuming it to be in the middle of the street, and the pressure at the burner?

A. Well, if there were only one burner running I should think it would be probably very small. It would depend upon the amount of consumption of gas from the same local pipe as the burner was drawing from.

Q. Take it in the evening as the conditions exist there. You say you made the first experiments in the evening. You know about what illumination is usually in force at that time. What would you think would be the difference in pressure in the main and the pressure at the tip.

A. In our case?

Q. Yes.

A. It would be very slight because we use electricity for illumination entirely in the building and probably not more than one or two gas-burners running in the neighborhood and drawing from the same pipe.

Q. Do you think it would be one-half inch?

A. I should hardly think so.

Q. You never made any experiment to determine that?

A. No. I suppose the stiffness of the meter would come in to a certain extent. I don't know anything about that, either, what that amounts to.

Q. I see in many of these tables like FF you have placed opposite these various items "blows," ditto, ditto, ditto. What do you mean by blows?

A. I mean that the flame under those circumstances was slightly flickering and produced a noise such as is ordinarily referred 3887 to when you say that a flame blows, from the fact that the gas is being forced out of the slit at too rapid a rate.

Q. That is something a consumer could observe?

A. Yes.

Q. I see in State's Exhibit DD, first column, pressure .3 inch. We find opposite that "Flame wavy." What does that mean?

A. That means that the currents of air se-t up by the burner itself produced a wavy motion of the flame.

Q. That would not be commercially usable or desirable for use, would *be*?

A. I think not.

Q. You have referred to various kinds of burners yourself. Some of those you say are regulated for two inches pressure maybe——

A. The Welsbach burner can be regultaed for the particular conditions of pressure, but the ordinary burner has no means of regulation any more than is put on in manufacture.

Q. You can regulate it, can't you, by a check? Aren't there burners manufactured known as high pressure and low pressure burners which are not Welsbachs?

A. I don't know.

Q. If you are going to regulate a burner you may regulate it up as well as you may regulate it down?

A. I presume you could, yes.

Q. Now, I find that instead of one inch which you suggest is sufficient for stoves that Dr. Marks says in his affidavit, that it has been found necessary of late years to increase the gas pressure to about two and one-half inches, which pressure is required for the best operation of both incandescent mantle lights and stoves, and on the stand he repeated he was of that opinion still. Do I understand that you disagree with that proposition?

A. I do.

Q. As a result of these experiments?

A. Yes. I don't think additional pressure is necessary. I think in both cases the stove and the incandescent mantle can be 3888 adjusted to give as high efficiency on lower pressures as they can on two and one-half inches.

Q. Do you know whether the burner which is used by Dr. Love, the City examiner, in his tests, No. 7 Bray is checked or not?

A. I don't know. I understand that it is.

Q. Do you know whether it has any layers of gauze or otherwise in addition to the checkings?

A. I do not.

Q. What sort of a stove did you use in your experiments regarding the efficiency of gas at different pressures in operation of the gas stove?

A. I did not intend to convey the idea I had made specific tests in those cases; the circumstances are in general extremely complicated. I said from my experience with gas burners, meters and stoves. That extends over twenty-five years as a physicist, using them for all sorts of purposes.

Q. Have you made any tests which you can produce here in reference to the pressure in a gas stove at which it will produce the greatest efficiency?

A. I cannot.

Q. You do know, as a matter of fact, do you not, that there is great complaint, large complaint that sufficient gas from time to time is not delivered to operate properly, gas stoves?

A. I have heard such complaints, yes, but I do not know to what it is due.

Q. In other words, that would be remedied, would it not, generally speaking, to some extent, at least, by greater pressure?

A. If the difficulty is due to little pressure it would certainly be remedied by an increase of it, yes. I do not mean to quibble on that answer at all.

Q. No, I understand. I think you are answering fairly. I am not criticising that. Did you allow for altitude in your estimate of pressure, in your test of the pressure? Make any corrections for altitude?

A. Altitude from where?

3889 Q. Above sea level?

A. Whether 150 feet above with a high barometer or 150 below with a low barometer would be the same thing.

Q. You did not make any correction for altitude?

A. No, I made none of those refinements. The things I was after were not hair splitting things.

Q. Not why the pressure was larger or smaller?

A. Not why the pressure was larger or smaller.

Q. Now, in your series 8, second table, State's Exhibit FF, was a check burner used?

A. Series 8, yes; and the pressures recorded in the first column in that case were behind the checks.

Q. Was that set for high or low pressure, do you know?

A. I don't know.

Q. You know that high pressure is set for 1 to 1½ behind the check and low pressure up to about one-half an inch?

A. I don't know. I bought an ordinary check burner.

Q. Of course with the growth of the use of gas as fuel, and of electricity as an illuminant you would recognize the right and propriety of the company to furnish gas of sufficient pressure efficiency to operate fuel appliances, whatever that be?

A. Yes.

Q. Now, in the Welsbach test, what sort of mantle did you use, the mantles of the Welsbach Company or merely mantles which you obtain in the market?

A. I bought the burners and mantles at an establishment on 125th Street that has "Welsbach" in large letters out in front of it, and I asked for Welsbach burners and Welsbach mantles and they had the Welsbach label on them and on the box and the warning against any substitutes for them, so I think they were really Welsbach burners and mantles.

Q. Was the same burner used in all of our tests, that Welsbach?

A. Yes.

3890 Q. When you spoke of a pressure at the tip of the Bunsen burner which is used in ranges, just what did you mean?

A. In that I meant the pressure behind the opening where the gas comes out to mix with the air. In all or nearly all at least of the burners of that type the gas issues from a small opening and draws along the air with it and mixes with it and these mixed gases then finally burn on passing out of the openings of the burner. The pressure referred to is behind the point of opening where the gas comes out to mix with the air.

Q. Was the opening at which you made these tests the end of the horizontal or a vertical tube?

A. A vertical. The tests were made with the Junker Calorimeter, and in that instrument the jet is vertical.

Q. Now, referring to State's Exhibit EE, I observe that a Welsbach in that connection was regulated for 1.54 inches pressure, Series V, if I am correct?

A. Yes.

Q. But it obtained a better result at 2.35 inches pressure didn't it?

A. It obtained a slightly greater candle-power but a lower efficiency or candle per cubic foot of gas consumed.

Q. Then it obtained the highest candle-power, not at 1.54 inches at which it was regulated, but 2.35 inches so far as actual candle-power is concerned?

A. That is quite correct. It is very difficulty indeed to regulate the Welsbach burner, thoroughly satisfactorily, and as far as that is concerned, in the next series also with the Welsbach, if I remember all right, a higher efficiency was obtained at a pressure different from that at which I had regulated it.

Q. What is the explanation of that?

A. The explanation is I did not succeed in getting the proper regulation of gas and air for the burner and mantle which I was using.

3891 Q. Well, is your testimony here as to the pressure which is required for the proper operation of a Welsbach lamp at the highest efficiency based upon these experiments or is that based upon experience?

A. My testimony that within the ranges from an inch to two and one-half inches, and I thought approximately the Welsbach can be regulated to equal efficiency as based upon the experiments which I have made in this connection.

Q. Now, as a matter of fact, isn't it impossible to operate all appliances which an ordinary consumer has provided from his open-flame burners and Welsbach and gas stoves at a single pressure, if he desires the greatest efficiency for each class of apparatus?

A. I think not. I think if he uses the open-flame burner, adopted to the pressure of the gas he was furnished with, and his gas stoves and his Welsbach burners regulated to that pressure that he could run very satisfactorily on the same pressure.

Q. On the same pressure?

A. Yes.

Q. Well, if that is the case, why then, could not the pressure be limited at the meter by turning the cock there down to any point you desired?

A. It could be, provided there were no fluctuations in the pressure outside.

Q. Then, no matter at what point you set the pressure on the part of the consumer, or what point you conceive to be the best pressure for the consumer, there are bound to be fluctuations from that pressure, are there not?

A. Yes.

Q. And then to some extent the consumer must regulate the efficiency of his own apparatus?

A. Yes, if he wants the greatest efficiency, always.

Q. With what character or style of fuel appliances are you familiar as used throughout the City, I mean, for the use of gas?

3892 A. I am particularly familiar with the gas ranges as they are furnished or recommended by the Consolidated Gas Company. I have used one for a number of years in my apartment, and then, in the laboratory we have the ordinary burners and heaters of very great variety.

Q. Do you know of any stoves that are manufactured to operate at one-inch pressure?

A. I don't know as any stoves are manufactured particularly for that pressure.

Q. Well, is it not a fact that stoves are manufactured contemplating a certain pressure and to operate at the highest efficiency at about that pressure?

A. I don't know.

Q. Did I understand your testimony before the Stevens Committee to be in substance that the calorific value varies with the candle-power of gas directly and in the same proportion?

A. Not necessarily in the same proportion, but it is very likely to vary in the same way with the candle-power. It would depend probably, the exact ratio, upon how the increased candle-power was brought about.

Q. Now, you have stated that you assisted Mr. Edgerton in certain experiments as to pressure. What apparatus did you use in that connection, which you said in your testimony was proper apparatus?

A. We used what is known as the Richard Recording Manometer.

Q. Was that the same sort of an instrument that you used in taking these pressures which you have inscribed on the tables?

A. No. This apparatus which was intended for using in tests of this sort had no recording attachment whatsoever, and simply indicated the instantaneous pressure which had to be read off by the observer. In the Richard Monometer the pressure is recorded upon the paper upon a drum and the drum being driven by clockwork, the pressure at any particular hour may be read off with a fair degree of approximation.

3893 Q. Were these tests which were inscribed on these sheets as to the different pressures made consecutively one after the other?

A. Yes.

Q. Within a few minutes of each other?

A. Within half an hour or so, yes. They were run through as rapidly as the tests could be made.

Q. And did you change your pressure apparatus or otherwise adjust it so that it showed the pressure in each instance indicated before you took your candle-power?

A. Yes.

Q. Was it so adjusted so that it would maintain that pressure firmly?

A. If it were not so adjusted and if the pressure varied during the series of tests the pressure was read from time to time and an average pressure was taken.

Q. On what sort of a gauge or by what means did you know exactly what the pressure was at any moment?

A. That was with the arch manometer that I described a few moments ago, where the pointer magnifies the scale of pressure and the pressure can be read off at any instant.

Q. Is that an instrument which has been in use in your laboratory for some time?

A. Not that one, no.

Q. How long has that been in?

A. About a month now.

Q. Did you make any tests to verify it in advance?

A. I did.

Q. Now, what were these pressure experiments or tests which you made in connection with Mr. Edgerton, and what part did you take in them?

A. The tests consisted in maintaining for approximately a month the Richard Manometer in operation so that a continuous record of the pressure might be had, and my part in the operation consisted in looking at the manometer from time to time and changing the sheets every twenty-four hours.

3894 Q. The manometer, of course, is automatic in its action, assuming that the sheets were there?

A. Yes.

Q. And to what was it attached?

A. It was attached to the burner, to a gas hose attachment and a gas pipe in the same room in which these other tests were made.

Q. Do you mean that it was attached to the service pipe or was it attached where the tip was originally located, by the removal of the tip of the burner?

A. It was not attached to such a burner. It was attached to what is known as a hose attachment, which is a brass fixture having a stop-cock extension for the attachment of a rubber hose. They are often put in behind the burners in rooms where people wish to attach a stove or something of that sort.

Q. Of course the burner was kept closed or the pipe sealed?

A. There was no burner there.

Q. Did that connect with a service pipe upon which there were other burners drawing?

A. It did, part of the time, yes.

Q. How many other burners were drawing on that service pipe or could have drawn if lighted?

A. I don't know how may could have drawn. There were probably not more than four or five at the outset that there was any likelihood of being drawn, because the fixtures through the rest of that end of the building are never used for gas lighting as they have electric lighting altogether.

Q. How high above the level of the street would you say this way?

A. The room was about ten feet, I should think.

Q. Do you know what the elevation is at that point above the sea?

A. It is just about 150 feet. The elevation of the room in which we were working is within ten or fifteen feet of one hundred and fifty feet. I don't remember now whether it is the basement 3895 floor or the main floor of the building which is exactly one hundred and fifty feet.

Q. What was the size of the pipe which was attached to the manometer, the hose as you call it?

A. The rubber pipe?

Q. Yes.

A. It was what I think is ordinarily called three-eighths.

Q. Do you know what the size of the service pipe was?

Mr. Kirby: You mean the hose-pipe?

The Witness: The pipe upon which this stopcock was placed?

Q. Yes.

A. That was a half-inch iron pipe.

Q. Is that the main house-pipe or does it join the main house-pipe?

A. It joins the main house-pipe.

Q. What is the size of the main house-pipe, if you happen to know?

A. I think it is a two-inch pipe.

Q. Were there any Bunsen burners in use on this house-pipe?

A. No.

Q. The four or five that you have mentioned as possibly used, were small open-flame?

A. Practically, yes, I think so.

Q. Do you know about what the length of the half-inch pipe was?

A. I should say that it was somewhere in the neighborhood of forty feet. I don't know exactly where it takes out of the main.

Q. Were these all the experiments that you had to do with Mr. Edgerton and the tests, that is, simply recording the pressure for the period that you have referred to?

A. Yes, that was practically all there was.

Q. What period did that cover?

A. That covered a period from about October first, I think, until the present time.

Q. It is still going?

A. Yes.

3896 Mr. Mathewson: That is all.

Redirect examination by Mr. Kirby:

Q. You have been asked, Professor, in reference to the relationship between calorific power and candle-power, and you have stated that it was your opinion that one varied somewhat directly as the other. Is it not a fact that they do vary, one as the other, but that the calorific power lags behind any change in candle-power?

A. The increase in candle-power in general is necessarily brought about by the introduction into the flame of materials that are rich in carbon, and the addition of carbon to the gas in some form or other, and the additions of carbon would necessarily increase the calorific value as the carbon has a calorific value as well as the other gases, and on that account the addition of these materials to increase the candle-power, would increase the calorific value, and that would be approximately proportional, but I have no evidence myself as to whether it would be likely to vary one way or the other.

Q. Mr. Mathewson has asked you in reference to fluctuations of pressure and you have stated that in your opinion, such fluctuations are apt to occur.

Mr. Mathewson: Bound to occur.

Q. Or bound to occur. Is it or is it not your opinion that such fluctuations should be as little as possible and in no event beyond one and one-half inches?

A. It is.

Q. Your attention has been called to a statement giving the results of your experiments with the Welsbach burner, the same being State's Exhibit EE, and especially to the fact that with an increased pressure from 1.54 to 2.35 inches that the actual illuminating power of the flame increases. Does not this table and the results of 3897 your experiments also show that while the illuminating power increased, the efficiency of the flame, that is the candle-power per unit of gas burned, fell from 23.2 to 18.5?

A. It did.

Q. Your attention has been called to the growing use of gas ranges and other appliances to use gas as fuel, and the desire of consumers to have sufficient pressure to supply their demands in this direction. Is it not a fact that you have heard that most of the complaints come from faulty house-piping rather than from any other cause?

A. From my experience I should say that in very many cases at least, if not in the majority of cases, the difficulty is very largely due to improper house installation.

Q. Your attention has been called to an affidavit in which you made reference to the result of certain experiments made by Professor Chanler. Do or do you not know whether Professor Chanler used a Bray check burner in these experiments?

A. I don't know now.

Q. Do or do you not know where he took the pressure readings in his experiments?

A. I do not.

Q. The pressure which you have made reference to, are those taken at the tip of the burner with which you were experimenting, and do or do you not know whether it is customary in most of the photometers in use to take the pressure at this point?

A. I know that it is very common to lead the gas some considerable distance from the pressure gauge and meter to the burner, and I know from my own experience that a very considerable drop in pressure is often brought about by this piping between the pressure gauge and the burner itself.

Q. Do you consider that the proper and more scientific and most accurate way to measure pressure is at the tip rather than at any other point?

3898 A. It seems to me that that is the only proper place to take the pressure, if you are going to determine relations between burning conditions and pressure.

Q. Your attention has been called to certain notes upon your experiments in reference to the flame being wavy and the like. In the course of your experiments did you observe the character of flame of check burners, and if so, was it of this wavy character?

A. And the flame of the check burner is a comparatively wavy flame, in practically all cases, inasmuch as the action of the check is to reduce the pressure so that the gas coming out of the burner under low pressure is not very steady.

Q. From this would you conclude that while a check burner would probably give a flame of higher candle-power efficiency, that such flame would be much more unsatisfactory for general use than the ordinary bat-wing burner?

A. I think most people would prefer a bat-wing burner with a steady solid flame to the ordinary check burner flame which is affected by drafts very easily.

Q. Have you in the course of your observations observed any instances in which check burners have been replaced by the bat-wing or fish-tail burners or where checks have been removed in such check burners?

A. The only case that I remember now is one case where I pulled the check out of the burner myself in the apartment, and I cared for more candle-power even at the sacrifice of efficiency.

Q. You have been asked if you made any corrections in your experiments for temperature or atmospheric conditions, atmospheric pressure and so forth, and you have answered that you did not. Do you think that the lack of such correction in any way affected the correctness or incorrectness of your statement?

A. I do not, for various reasons. The corrections referred to are refinements in determination and can only be satisfactorily applied when investigations of the highest accuracy are carried out 3899 and for one thing I consider such experiments with the sperm candles as out of the question. The chief reason, however, for not making any corrections of that sort in these experiments, was the fact that the series of experiments was carried through in so short a period of time that the conditions of barometric pressures, room temperature, moisture of the atmosphere and carbonic gas in the room could be considered as practically constant during the series and it was essentially with relative effects that I was dealing and not with absolute candle power.

Q. And if such corrections had been made do you think it would to any great percentage have changed the results you obtained?

A. No, they would not have changed the general results appreciably.

Q. Do you know whether it is customary or do you consider it necessary to make such refined corrections?

A. Not in cases of this kind, not in work of this sort. The Act for example, in determining candle-power, makes no reference to any such correction as that.

Q. Your attention has been called to——

Mr. Mathewson: Either as to pressure or candle-power, does it, the Act makes no provision as to pressure or candle-power as to such refinements as that.

The Witness: No, it does not say anything about it.

Q. Your attention has been called to conditions as they may exist in St. Louis and as they may exist in the Borough of Manhattan in reference to stray currents and to possible electrolytic action occurring therefrom. Do you know anything about the conditions in St. Louis with reference to this matter?

A. I do not.

Q. Would you be able to make a comparison with condi- 3900 tions in St. Louis and the Borough of Manhattan with your present knowledge of the conditions as they exist?

A. No.

Q. Nor did you?

A. No.

Q. Your attention has been called to the various electric railways in the Borough of Manhattan and reference has been made to the method in use of returning their circuits. Are you familiar with the circuits of these various electric roads as to whether they are insulated or whether they are not, have you ever made any study of that question?

A. I have never made any study of it and am only familiar with it in a very general way.

Q. So that any conclusions or inferences which might be drawn from your answers to such questions would be other than any deductions made from a knowledge of the situation as it really exists?

A. Yes.

Q. You have been asked whether or not it is a fact that an electric current will follow any path that is interposed which has any conductivity whatever, and you answered that such is indeed the case. Do you want it to be understood from that answer that any appreciable current would follow a path of high resistance if a path of low resistance were there for it to follow?

A. If the resistance were very high, in one case, and low in the other, of course, only a very small fraction would take the path of the higher resistance.

By Mr. MATHEWSON:

Q. But the fixed law would govern, I assume which you have defined, would it not, for currents?

A. Yes.

By Mr. KIRBY:

Q. As a matter of fact, the earth is of relatively very high
3901 resistance to that of a metal conductor, is it not?

A. Yes.

Q. And moist—water in itself is practically a non-conductor, isn't it?

A. Pure water is a non-conductor practically.

Q. And if earth were moistened so as to become mud, I presume that mud would be relatively of a very high resistance compared to a metal conductor, would it not?

A. Yes.

Q. Now, if we had a moist earth which we will call mud, does it necessarily follow that the passing of a current through that mud would set up an electrolytic action therein?

A. The passage of a current if the current actually goes through the mud, we will have no immediate evidence of the action of the current except at the places where the current enters and leaves the mud.

Q. And even there would we have electrolytic action if there were not the necessary solution of salts to permit a decomposition of the substance through which the electric current passed?

A. Well, if there were no salts there of that sort, you would have no action.

Q. You have stated that if there is electrolytic action the point where the harm, if any, will result, will be that where the current leaves the metal conductor, which in this instance, we take to be a gas pipe. Because a current is on a gas pipe, does it, to your mind, follow that the current will leave the gas pipe through the earth?

A. Well, of course, the current will have to get off somewhere, but it may go home to the works and go out through the holder and water tanks and connections of that sort. It may not leave the pipe, strictly speaking.

Q. And is it not more likely to follow the iron of the gas pipe until it reaches some other metal conductor than it would be to stray off into the earth and return in that way?

A. In general it would, yes.

3902 Recross-examination by Mr. MATHEWSON:

Q. Did you make any experiments with the Kern mantle burner?
A. No.

Q. Do you not know that the most efficient mantle burners use pressures above even two and one-half inches?

A. I have heard that there are some burners that use high pressures, but I do not of my own knowledge know anything of them.

Q. What was the size of the burner out of which you took the check in your own case?

A. I think it was a four-foot burner. I don't remember particularly.

Q. Four-foot Bray burner?

A. No, it was not a Bray burner.

Q. Was it a fish-tail?

A. I think it was a fish-tail, but it was something over a year ago and I only remember that the flame was a wavy smallish flame and I pulled out the check and got more candle-power, but I suppose paid more for it correspondingly.

Q. Don't you know that the gas company furnishes according to location and use desired, burners of two, three, four and five feet, adjusting them according to the requirements of the situation?

A. That may be. I did not know it.

Q. Is not the check in the burner intended to equalize the flow and make it uniform?

A. That is the intention of the check, yes.

Q. You said, I think, that where very little gas was used, as at Columbia College in the department which you were experimenting that you thought the difference between the pressure at the main and the pressure at the burner would be very slight. The difference would be very slight, is that correct?

A. I think so, yes. I don't know as I say anything about the loan in pressure in the meters. It was an unknown factor to me,
3903 but otherwise I should think there would be but slight difference in pressure.

Q. All the tables you have presented here except State's Exhibit EE, relate to the open-flame burners, don't they?

A. Yes.

Q. As a matter of fact taking these tables, it appears that five out of the six assumptions on State's Exhibit CC, Series 1, and three out of the six on State's Exhibit CC, Series 2, and three out of four on State's Exhibit DD, Series 3, and three out of four on State's Exhibit DD, Series 4, and four out of five on State's Exhibit FF, Series 7, and two out of five on State's Exhibit FF, Series 8, and three out of five on State's Exhibit GG deal with pressure below one inch?

A. Yes.

Q. And if there is practically no loss between service pipe and the main, they would be pressures below that at which the company under the present law is permitted to deliver gas, would they not?

A. I don't know as I catch the point quite.

Q. Assuming that there would be in these cases practically no difference in pressure between the main and the burner where you made the experiments, that would mean that in all these cases you took pressures below that at which the company would be permitted to deliver the gas, is not that so?

Mr. PAGE: Objected to as an entirely improper because it is assuming that if there would be no difference in pressure there will be no difference, will there be any difference in the pressure?

Mr. MATHEWSON: No, that is not the point.

Mr. PAGE: That is your question.

The MASTER: I will allow it.

Mr. PAGE: Exception.

A. It would.

3904 Q. Is it not true in every one of these tables and series, the greatest efficiency, as you term it, of candle-power, of five cubic feet, per hour, is reached, or appears by these tables for a pressure substantially below one inch?

A. Pressure at the tip below one inch, yes.

Q. And I suppose if there were practically no difference between the pressure at the burner and the pressure at the mains, that would mean the same thing for the main?

A. Yes.

By Mr. KIRBY:

Q. These experiments, the results of which are set forth in State's Exhibits CC, DD, EE, FF, GG, HH and upon the chart accompanying the same, State's Exhibit II, the result set down in the first line under each series is that you deduce the standard at 22 candle-power from five cubic feet of gas burned per hour and upon which the standard of comparisons are based?

A. Yes.

Mr. MATHEWSON: They are in some cases and in some they are not. There are comparisons showing the actual amount of cost.

GEORGE F. SEVER, called as a witness in behalf of the defendants, being duly sworn, testified as follows:

Direct examination by Mr. KIRBY:

Q. Professor Sever, are you upon the faculty of Columbia University?

A. Yes, sir.

Q. And what chair do you hold there?

A. Professor of Electrical Engineering, Junior Professor of Electrical Engineering.

3905 Q. You are also Dean of the faculty of what?

A. Acting Dean of the faculty of Applied Science.

Q. Are you a graduate of any technical schools?

A. I entered the Electrical Engineering Course at the Massachusetts Institute of Technology and was there for four years.

Q. After that what did you do in the way of scientific work or occupation?

A. I spent six years in electrical engineering and electric railroad work and designing with the Thompson-Houston and General Electric Companies, and became connected with Columbia University in 1893, as inspector in the Electrical Engineering Department. Since then I have been pursuing electrical engineering in its various branches, such as electric lighting, electric power, and electric railway.

Q. Do you belong to any scientific society?

A. The American Institute of Electrical Engineers and various other technical societies, and have been a vice-president and manager of the American Institute of Electrical Engineers.

Q. Do you hold any office under the government of the City of New York?

A. Yes.

Q. What is that?

A. Consulting Electrical Engineer to the Department of Water Supply Gas, and Electricity.

Q. How long have you held such an office?

A. Four years.

Q. What are your duties as such official, especially in reference to the streets in the Borough of Manhattan?

A. My duties are to report to the Commissioner at his request on any electrical engineering problem that is brought to his attention either by citizens or by the engineers of his department.

3906 Q. In this connection have you made any special study of possible electrolytic action or corrosion of the water mains or other mains or conductors in the streets of the Borough of Manhattan?

A. To a slight extent.

Q. Have you in the course of your studies or duties as Professor in Columbia University or elsewhere made any special study of the problem having to do with possible electrolytic action and stray currents from power plants or electric railways or other sources?

A. Yes.

Q. Have you made an investigation into the conditions as they exist in the Borough of Manhattan in reference to such problems, the source of such trouble if it did arise?

A. Yes, I have.

Q. Are you familiar with the various electric roads in the Borough of Manhattan?

A. Yes.

Q. And the method with which these roads have been installed and the supplying of power to the moving parts thereof?

A. Yes, I am familiar with all that construction.

Q. Are you familiar with the report of the American Gas Light Association for the year 1906, being a special report of a committee appointed by such association and known as the Committee on Electrolysis?

A. Yes, I am.

Q. And was this report made and did such Committee which made it consist of A. G. Glasgow as chairman, John Williamson, S. P. Curtis and Arthur H. Hall?

A. Yes, it was signed by those members of the committee.

Q. And was Professor Albert F. Ganz, M. E. of Stevens Institute, Consulting Engineer to the Committee?

A. Yes.

Q. And did you in the preparation of this report act in any capacity in relation to the work performed by Mr. Ganz?

A. Quite unofficially, in furnishing him access to all my collection of electrolysis literature, which he freely consulted.

Q. Do or do you not know whether the report of such Committee states——

3907 Mr. Mathewson: Wait a minute. Are you preparing to prove this witness's opinion or are you getting him to quote somebody else's opinion? Because I think the rule is well established that you cannot, on direct-examination of your own witness, present to him books and so on, and ask if he approves of them. That very same question arose before the Stevens Committee when I endeavored to pursue the same course with reference to Professor Chandler, and Senator Page will remember that Mr. Hughes promptly objected and stated that that question had been decided by the Court of Appeals in a case which he himself argued, and that he himself knew what the law was, consequently I was unable to pursue that course although it was stated that on cross-examination you might so examine a witness.

Mr. Kirby: I withdraw the question.

Q. We have in the Borough of Manhattan how many different kinds of electric railroads?

A. We have four.

Q. What are they?

A. We have the system commonly known as the Metropolitan, which is a surface road; the elevated system, commonly known as the Manhattan; the subway system, and a short section of the Union Railway operating with a single overhead trolley.

Q. Of these which is the smallest?

A. The Union Railway.

Q. In regard to number of miles of tracks?

—. The Union Railway.

Q. Where does that operate?

A. It operates from 135th Street and 8th Avenue across town, running east, and crosses the Harlem river on the Madison Avenue bridge.

3908 Q. Will you describe to us the method of construction of the street railway, that is, what you have called the Metropolitan?

A. The Metropolitan or surface system consists of a shallow conduit placed between the tracks in which the two conductor rails carrying current are placed, supported on insulators, held on the frame work of the yokes of the system and the current is kept on those two conductor rails at all times without serious leakage.

Q. This is generally what is known as the double conductor conduit system, is it not?

A. Yes.

Q. And the return system is completely insulated, isn't it?

A. Yes.

Q. And from this system there would be no stray currents, would there?

A. No.

Q. Now, we have the subway. Will you briefly describe the system on the subway with reference to the electric conductors and method of furnishing the current to the moving trains?

A. The Subway consists, essentially, from its operating standpoint, of a regular railroad system supplied with its additional rail commonly known as the third rail, which acts as the positive conductor and carries the current from the various sub-stations of the subway to the moving units or trains. This third rail is carefully insulated by insulators from the ground and from all other surrounding objects. The current, after passing through the motors of the cars, is returned to the sub-stations by the service rails or running rails and additional copper feeders known as negative feeders which are connected with the negative bus-bars at the sub-stations, and the generators. The service rails are supported on wooden ties which in the subway proper are embedded in stone ballast, the stone ballast being placed directly on the concrete floor of the subway. One rail in each track is used for signal purposes and is not used or utilized for carrying the current back to the sub-stations.
